AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 1. SAN FRANCISCO, SATURDAY, JULY 6, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Ropp Straight-line Furnace.

Herewith is portrayed the Ropp Straight-line Furnace, now in operation at the Selby Smelting and Lead Works, Selby, Cal. It is the invention of Mr. Alfred Ropp, superintendent of the Selby Smelting and Lead Works, and was patented in the United States last January.

It is the result of his experience and familiarity with mechanical roasting furnaces in this country and Europe, and is claimed to furnish an improved method for the roasting or chloridizing of base or sulphuretted ores, or the roasting of mattes.

The exclusive rights to the manufacture and sale of the Ropp Furnace, under the United States patent, have been granted by the inventor to Parke & Lacy Company, 21 and 23 Fremont street, San Francisco.

The furnace consists of an ordinary reverberatory hearth built in a straight line or rectilinear in form. In the center of the hearth there is a longitudinal slot or channel as shown in the figure on page 6. Through this slot an arm, connected below with a four-wheeled truck or carriage, extends upward, and across the upper end of the arm is the supporting bar from which the rabbles, or stirring teeth, project. The carriage runs upon a track below the slot or chaunel in a chamber provided for it, where it is accessible at all times aud while the furnace is in operation. This chamber continues the entire length of the furnace and is made sufficiently large to admit of a man going under the carriage and making any repairs that may he necessary. Four of these carriages are placed at equal distances from each other and are attached to the steel wire rope hy which they are propelled; aud the rabble arms are so constructed that each side can be adjusted independently of the other by means of screws and slots, and can be set so that the rabbles shall reach the ore on the hearth to the proper depth. The track, after passing underneath the furnace throughout its entire length, is continued parallel with and exterior to the furnace, describing a curve at each end. The description given by the Parke & Lacy Co. says :

"The driving mechanism of the furnace is of the simplest form, consisting of two bevel gears with their shafts, and a horizontal sheave, on the vertical shaft, around which a steel wire rope travels. A similar sheave is mounted on a vertical shaft at the opposite end of the furnace. All of this mechanism is outside the furnace, and easily accessible for oiling and repairing. The rope does not get hotter than the hand can bear, and it is not necessary that it should he taut. The ore is automatically fed into the furnace at the feed end through Challenge feeders, and is moved along the hearth, at any speed desired, hy the rahbles, which are carried by the moving carriages or trucks, and is automatically discharged, by gravity, into a hopper or car at the discharge end. During the time required for the carriages to pass over the length of the track exterior to the furnace, from the point of exit to the point of eutrance, the rabbles become thoroughly cooled and in condition to again enter the furnace. Three or more fireplaces are used, depending upon the fuel and the work to he done. These fireplaces are shown on the plan or horizontal section, and can he arranged for either hand or automatic firing. By adjusting the automatic feeder the capacity of the furnace can be increased or diminished, and an ore can he roasted 'dead' or it can be discharged from the furnace, retaining any portion of the original percentage of sulphur.

"In chloridizing the salt can be fed at any point, thereby saving the immense loss of salt and silver common to those forms of furnaces in which the salt is fed with the raw ore. The furnace may also be used as a cooling or drying hearth, and the general arrangement is such that it may, by slight changes, be adapted to advantageously replace any other form of roasting, chloridizing or drying furnace. The standard furnace is 105 feet long and 11 feet wide in the clear, and has a capacity of roasting 36 tons of ore, containing 20 per cent sulphur, 8 per cent lead and 17½ per cent zinc and iron pyrites down to 5 per cent of sulphur, in twenty-four hours. To roast 'dead' the furnace requires slow feeding, and will handle from 20 to 22 tons in twenty-four hours, reducing the sulphur contents to less than one-half of one per cent."

PERSPECTIVE VIEW OF FURNACE.

ONE OF THE FIREPLACES.

VIEWS OF THE ROPP FURNACE AT THE SELBY SMELTING AND LEAD WORKS, SELBY, CAL.

THE president of the First National Bank of Creede, Col., is quoted as saying that millions of dollars are being invested in gold mines by men who are afraid it will be found out, and hurt their business standing. The Creede bank president is creating an atmosphere in which to flap the wings of fancy. The business men who are investing in mining property are not any less desirous of having the fact known than that of any other business proposition. There is nothing to be ashamed or afraid of, and the old silly idea which classified lottery tickets and miuing shares together is obsolete. Mining is just as legitimate a proposition as any other form of business, and any attempt or desire to keep investments quiet must be ascribed to the natural reticence of any man who does not care to make public his private affairs.

THE Trail Creek, B. C., discoveries give fresh proof of the folly of trusting to the tourist prospector, the man who covers fifty miles a day, and says: "I've been all over that country; there's nothing in it." The section that is now yielding so well has been "prospected" repeatedly, but never till recently in a close, painstaking way. Being in too big a hurry has lost many a prospector many a fortune.

REPORTS from the London mining share market indicate that some of the mining stock brokers there resident have mastered the worst phases of the business. Parisian buyers of South African shares now have men specially employed in London to see that shares bought by their clients are actually purchased and properly registered, realizing from experience the ease of the broker who is a bear juggling with an order for purchase.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Perspective View of the Ropp Furnace at the Selby Smelting and Lead Works, Selby, Cal.; One of the Fireplaces, 1. The West-Lode as Shown in Workings on the Consolidated Virginia Ground, 2. Combine Safety Water Tube Boiler; Perspective Elevation—Two Boilers in Battery; Side Elevation; Transverse Sections, Through Steam Drums; Section of Details, 4. Plan or Horizontal Section of Ropp Furnace; Section Through X-Y; Feed End of Furnace; Discharge End of Furnace, 6.

EDITORIALS.—The Ropp Straight-Line Furnace; Afraid It Will Be Found Out; The Folly of Trusting to the Tourist Prospector; The London Mining Share Market, 1. The Brunswick Lode Proposition; The Index to Our Seventieth Volume; Need of Development; The West-Side Lode, 2. "Protection for the Mining Interests," 3.

SCIENTIFIC PROGRESS.—The Greatest of Modern Problems; Dimensions of the Universe; Origin of Light: The Kiel Ship Canal; Mr. Maxim's Motive Power; Chicago's $25,000 Drainage Canal; The American Association for the Advancement of Science, 8.

MECHANICAL PROGRESS.—Water in Steam Pipes; Horseless Road Carriages; Mechanical Notes; Boring Steam Engine Cylinders While Heated; Shipping Molten Metal by Rail, 8.

ELECTRICAL PROGRESS.—The Possibilities of Electrical Pumping Machinery; Figures on Mine Working; Two Great Enterprises, 9.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 18.

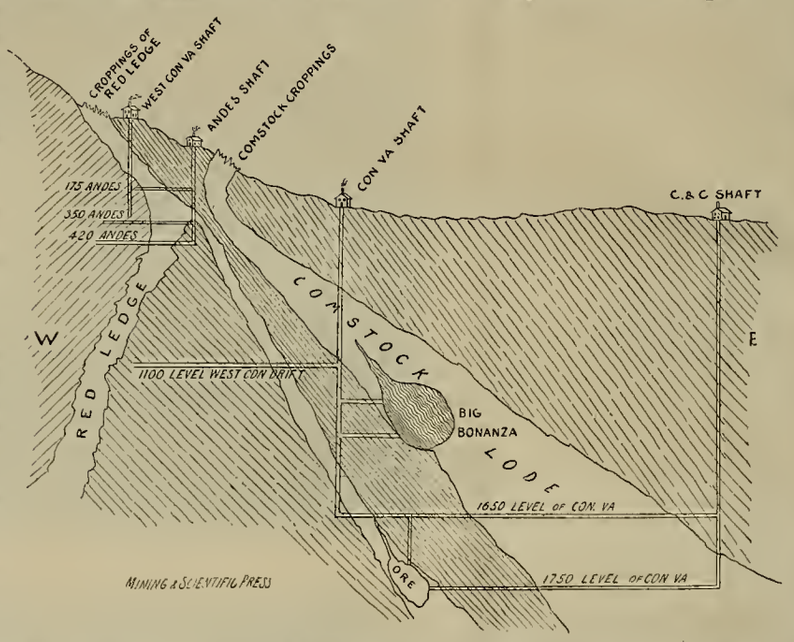
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 10-11.

MISCELLANEOUS.—Concentrates; Obituary, 3. Combine Safety Water Tube Boiler; The New American Steamship St. Louis; Asbestos Packing, 4. Treatment of Roasted Gold Ores by Means of Bromine; The Present Limitations of the Cyanide Process, 5. The Necessity for Competent Geological Surveys for Gold Mines, 6; Annual Mint Accounting; Coast Industrial Notes, 7. A Powerful Projectile; Land Added to the Great Areas of the West; Foundry in Which James Watt Worked, 9. Notices of Recent Patents, 11; Index to Volume LXX, 12-13. The Mineral Hydrocarbons; Pacific Coast Diamonds, Etc., 14. A Set of Office Rules, 18.

THE Brunswick lode proposition meets with almost universal favor. There is a good prospect for the Comstock, even now, if the owners work the mines rather than the street, and introduce modern milling methods which exclude manipulatiou of the returns.

THE index to the contents of the seventieth volume of this journal, which appears on pages 12 and 13 of this issue, gives an idea of the scope and variety of the articles published hereiu during the last six months, and will he of value to the thousands of our readers who preserve their papers for reference.

THE Sacramento *Bee* sees in the suit against the North Bloomfield the unconstitutionality of the Caminetti bill and "the closing of the small mines." The *Bee* is more thau ordinarily ridiculous in this instance. The question is shall the company mentioned continue operations under decree of the court or under the provisions of the Caminetti hill? The *Bee*, like its morniug colleague, is doing all it can to stir up hostility to the hydraulic miner, evidently under instructions from its corporation masters, who began warfare upon the miners through their kept papers about the time the miners began to oppose the attempted wholesale illegal absorption hy the corporations of the mineral area of this commonwealth.



A SHASTA COUNTY PAPER says: "The only reason why there are uot more wealthy mining companies operating in this county is because it is difficult to find mines that are known to be extensive." A Nevada county paper asserts that there are plenty of good mines unworked because nowadays it takes an aggregation of capital more than one individual can usually command. These two simultaneous assertions, made independently of each other, not in auswer, but as separate expressions of belief, form a good illustration of the need on the one hand of development work and on the other of such an association as that recently outlined herein. A good property developed sufficiently to demonstrate its value need not long go begging.

The West-Side Lode.

Probably no mining district in the world offers a wider field for geologists than does the Washoe in Storey county, Nevada. Although many eminent scientists have given that section, particularly the Comstock lode, large personal attention, yet we fail to find any two in full accord as to the origin of the fissure and its mineral deposit. The contention regarding the fissure seems to have settled down to a conviction that it was caused by volcanic action. Writing on the Comstock lode, Baron Richthofen states that the rending of the fissure was due to the eruption of trachyte which accompanies the vein at a distance of two miles to the east. Sanidine-trachyte is a volcanic rock, and, though it did not pour out from the craters of actual volcanoes, yet it must have been attended hy the same phenomena which accompany the outbreaks of lava. The process which immediately follows the opening of fissures at or near active volcanoes is the violent emission of steam. The scientist calls a crevice in this case a solfatara. It has heen proven by extended researches into the causes of the volcanoes in Iceland, South American Andes, Canary Islands, and the tertiary volcanoes of Hungary and Transylvania, that every solfatara in the course of time passes through stages. The first is when the steam is accompanied hy gaseous combinations of fluorine and chlorine. The second is when it is accompanied hy those of sulphur, while still a third is ordinarily marked by the emissions of carhonic acid and combinations of hydrogen and carbon, at which time the term solfatara is no longer applicable. Commenting on the above proposition, Baron Richthofen thinks that in the elements evolved during the first two periods are all the conditions required for filling the Comstock fissure with such substances as those of which the vein matter is composed. Steam ascending with vapors of fluosilicic acid creates in its upper parts, according to well known chemical agencies, silica and silicofluohydric acid, the former in solid form, the latter as a volatile gas, which acts most powerfully in decomposing the rocks it meets on its course. The chloride of silicon in combination with steam forms silica and chlorohydric acid. Fluorine and chlorine are among the most powerful volatizers known, and form volatile combinations with almost every suhstance. Besides silicon, the metals have great affinity with them. Well known and recognized scientists affirm that all those which occur in the Comstock vein could ascend in a gaseous state in comhiuation with one or the other of them. They must then he precipitated in the upper parts as metallic oxides or chlorides in the native state. Reasoning from this point of view, the Comstock fissure was gradually filled from its upper portion downwards, with all the elements found chemically deposited in it. The hetter informed miners on the Comstock, who reason from scientific knowledge and also from practical workings on the lode, have held to the opinion that lying to the west and running farther under Mount Davidson would ultimately be found the mother lode, from which was precipitated the various chemical properties and lighter metallic suhstances which filled in the Comstock fissure. They contend that the main west lode would he found almost entirely gold hearing, and that it would be more clearly defined and more conformatory to lodes in other deep mining districts. In this view they have heen largely strengthened hy work to the west on the upper levels of Crown Point, Belcher, Yellow Jacket, Alpha, Andes and West Con. Virginia, not to say anything regarding the shafts sunk to the west and good results found many years ago, but from which they were driven by water. This theory, hased on scientific knowledge derived from mining districts of a similar character, found confirmation in horings by the Yellow Jacket Mining Co. to the west on the 3,000-foot level, where they tapped a powerful stream of water which was heavily charged with hydrogen sulphide and had a temperature of 170° F., with equal evidence of the presence of carbonic acid in the water of the lower levels.

The engraving herewith given presents a hetter idea of the west lode theory as shown in workings on the Con. Virginia ground. The shafts as given show the first workings on the lode; and as water interfered with the workings, shafts were sunk still farther to the east so as to get at the lode at greater depth.

To confirm the west-side lode theory at depth, the West Con. Virginia mauagement started work, through the company's superintendent—H. W. Tangerman, au experienced and well-known mining man—westward as the cut shows from the 1100-foot level of the old Con. Virginia shaft, which had heen used to hoist the ore of the great houanza of the Consolidated California & Virginia mine. This great ho-

nanza of ore was to the eastward of this shaft and some 100 or 150 feet deeper at its heginuing. From that point it extended downward several hundred feet. Before the drift on the 1100-foot level was started hy Mr. Tangerman, theoretical miners had contended that Mt. Davidson, west from the Comstock lode, was a solid mass of syenite, which theory has been exploded by the drift as it was pushed west. Starting in a west crosscut, which had been ahandoned by the Con. California & Virginia miners, that had heen extended about 475 feet west from the shaft, and in the west wall of the Comstock lode, Mr. Tangerman contiuued on westerly. As this work is of a very interesting and important character, he has heen interviewed regarding his penetration into that unknown country. Mr. Tangerman says: "I first passed through the west wall of the Comstock, which has an easterly pitch of 45°, and entered a narrow vein, consisting of porphyry seams of quartz and clay, some 100 feet west of the starting point.

"This vein had a little water in the quartz seams hut did not show much mineral. It terminated against a solid wall of quartzite, 610 feet west of the the shaft. This west wall pitched cast at an angle of ahout 65°, and corresponded to the pitch or angle of the vein. There was nothing in the miueral line to excite attention in this narrow vein, so I continued on to the west through as tough a wall of quartzite as was ever penetrated hy a miner. It was 275 feet thick, standing at an angle of 65° or ahout 25° from a perpendicular. We next went through ahout 50 feet of black, hard porphyry with soft seams running through it in various places. Then followed ahout 30 feet of porphyry interspersed with seams of clay. At this point, some 960 feet

west from the station, we struck a strong flow of hot water. This hot water caused a stoppage of work. When the water had run off sufficiently we continued on west 150 feet farther through a quartz-porphyry formation. At this point the crosscut entered a syenitic formation which was blockey, like basalt. The crosscut continued in this last formation for 400 feet. As we passed out of this last formation another strong flow of hot water came in on us, and with greatest difficulty we have succeeded in getting in some 15 feet in a vein greenstone where the crosscut has been temporarily stopped to allow the water to flow off.

"This crosscut proves that the red ledge has turned well to the west and has assumed the shape of an antielinal vein. The water encountered in the narrow seams between the formation flows from that vein.

"As we get farther west we will find this vein, and I will then show the people of the Pacific Coast that all the mineral found in the Comstock lode to the east was an overflow from this back vein, and that the formation which my crosscut has passed through in the past 1,000 feet stands like a pyramid between the two veins. And, furthermore, the west vein will contain more gold in proportion in its vein matter, because gold, being heavier than silver in solution, will be retained in the back vein, while the silver flowed freely with the water and matrix that helped to make up the east vein. The east vein has formed with the country and is enclosed in the regular stratification of the mountain. The west vein has pushed up through the formation and runs at an angle contrary to the regular dip of the mountain. I hope to live to see more wealth taken from the antielinal vein than was taken from the Comstock lode. A little more work will prove my statement to be correct. In a few days I shall start up with a diamond drill and extend the crosscut in that manner until the vein above me is drained."

THE *American Economist* in a patronizing way suggests that "protection be accorded the mining interests," and that they "receive friendly recognition." Probably nothing could better illustrate the density of the average monometallist than the fact that a publication which represents some of the best thought of the country should so entirely miss the point. The *American Economist* is a clever, logical champion of the cause of protection; it upholds the doctrine of a high tariff and the levying of import duties on foreign manufacture to foster domestic manufactures. It is clear-headed, and with a broad horizon argues convincingly on political subjects. Yet, blinded by its environment and not realizing the existence of facts it fails to see, all it can say regarding the bimetallic question is that the miners should be "recognized" and have "protection" accorded them by the government. It appears to imagine, or affects to believe, that this is a case where "the mining interests" are alone affected, and that as a boon "the miners" should receive "recognition." If there is any one class of workers in this nation who do not need "protection" or "recognition" it is the miners. If there is any class not stricken adversely by the financial stress it is "the mining interests." The *American Economist* forgets or ignores the fact forced upon the nation's attention that this question of bimetallism is a national one, intimately affecting the prosperity of the workers, the producers of every manufactured product, whether as employers or employed; that the 64,000,000 people who never saw a mine are most intimately affected, and the 6,000,000 who live in the gold and silver producing region the least affected by the present effort to nullify the American Declaration of Independence. The one State of Illinois is believed to have lost more in the last 2½ years than all the gold and silver producing States and Territories put together. When silver slumped the State of Colorado simply ceased mining the despised white metal and began mining gold; the same way in other communities. In Illinois and similar States when the increased purchasing power of the gold dollar was felt in '93 the workers had no such resource; struck or worked at wages practically reduced. This matter is briefly referred to to illustrate how little even some of the clearest thinkers on the Eastern press understand the situation. It is neither the province nor the purpose of the PRESS to discuss politics, but those who make a business of that should certainly acquire some general knowledge of the facts before assuming to offer practical suggestions thereon. To be consistent, the *American Economist* should advocate protection to American industries and bimetallism for Americans. The two stand or fall together, and are diametrically opposed to free trade and monometallism.

Concentrates.

AN Austin smelter is to be built at Central City, Col.

CRIPPLE CREEK, COLORADO, claims a monthly gold output of $300,000.

THE Merced Gold Mining Co. have 200 men developing their properties at Coulterville, Cal.

E. H. BENJAMIN and associates have bought the Schneider claims, Granite Basin, Plumas Co.

THE Altoona Quicksilver mine last week sent down 190 flasks of quicksilver, valued at $7800.

THE White Horse Mining Co. has been incorporated at Helena, Mont. Capital stock, $500,000.

SUP'T G. E. BENT has resigned from the Le Roi and goes to Mexico, where he is interested in mining property.

FOLSOM is renewing its record of the days of '49, rich deposits close to that place now yielding $20,000 per month.

THE Mount Hood Consolidated Mining Company has incorporated with a capital stock of $1,000,000 at Spokane, Wash.

THE Tyro, near Coulterville, Mariposa Co., has begun crushing. Twenty-five men are employed. The shaft is down 500 feet.

F. I. HELLMAN, mining engineer on the Comstock, leaves this week for Johannesburg to superintend one of the numerous gold properties there.

ON the 1st the Napa Con. Quicksilver M. Co. paid the regular quarterly dividend of 10 cents a share, $10,000, and an extra dividend of equal amount.

IN Denver suit has been brought by the Mercantile Trust Company of New York for the appointment of a receiver for the Colorado Mining Stock Exchange.

C. M. SPANGLER, superintendent of the Standard mine, Oregon City, Butte Co., has 22 men employed. The Louisiana mine is expected to resume next week.

THE International Mining and Industrial Exposition to be held in Denver opens July 1, '96, provided satisfactory financial arrangements are effected.

A NEVADA exchange declares that there are several deposits of plumbago in Lyon county, so pure that lead pencils can be made out of the crude material, without any refining.

MESSRS. GODBE AND COLDRAN have an option on a controlling interest in the Sevier (Utah) Mining Co. By its terms $49,000 is to be paid on the 15th inst., and $50,000 more sixty days later.

T. HABISHAW, while working in one of the lower levels of the Marabel quicksilver mine in Lake county, was crushed to death by falling rock from the roof of the stope last Wednesday.

THE *Ledger's* Sonora correspondent says that the Rawhide mine at Jamestown cleaned up $34,500 in May with 20 stamps, and that the App, belonging to the same people, is doing about as well.

A COLORADO SPRINGS DISPATCH asks a confiding public to believe that a lady there resident, when properly hypnotized, can disclose the location of paying gold deposits in the adjacent hills.

THE Niagara mine, Shasta Co., is owned by a Holland company. The mine is leased: the lessees hire the mine, and work for one-half commission, the company milling the ore, which is low grade.

THE stage from De Lamar, Nev., to Milford, Utah, bimonthly, carries $60,000 bullion a distance of 160 miles, the run being made in thirty-four hours. An armed guard accompanies the treasure.

THE dissolution in the United States Court of the injunction secured by the Tyler Mining Company against the Last Chance enables the latter mine, one of the best in the Cœur d'Alenes, to start up again.

THE New Era Gold Mining and Milling Company has incorporated in this city. The directors are L. B. McMurtry, E. R. Wilson, H. R. Willis, G. Alexander, O. W. Schweitzer; capital stock $100,000, all subscribed.

THE Last Chance quartz mill, near Prescott, Arizona, was totally destroyed by fire last Monday night. The mill was in operation at the time of the fire, which originated from a spark from the smokestack. It will be rebuilt.

A. WARREN was killed in his mining claim on Rock creek, Plumas Co., last Saturday, by a tree falling upon him. His partner and himself had sawed through the tree and it fell in the opposite direction from which they expected.

AT the Golden Cross mine, fifteen miles west of Yuma, Arizona, the forty-stamp mill is working rich ore. The additional sixty stamps will be in operation in 90 days. The main shaft is now down 400 feet. The ore goes $15 on the plate.

THE Washington and Oregon Ore and Placer Gold Amalgamating Company has incorporated at Spokane, Wash., to introduce a new process for saving fine gold by means of fine screens of silvered copper wire. H. T. Mallon is secretary.

THE Keystone, Nev., mill and mine is the latest co-operative concern. The employes are running it, paying fair pro rata wages and paying off the company's debts. They say ninety days more will clear the property, and that it can be run at a profit right along.

WESTERN WASHINGTON papers severely criticise General Manager W. C. Butler of the Monte Cristo mine and Everett smelter. As he has been there but six weeks, it is in order for fair journals to give him time to gather the lines in his hands before criticising his driving.

THE Nelson *Tribune* wants the Dominion Government to raise the import duty on pig lead from $8 to $30 a ton. It says in that way only can British Columbia's silver-lead mining industry be developed. In Canada as elsewhere the tariff question appears to be a local issue.

O. W. SCHWEITZER has secured a six months' lease of the Kennedy, Nev., mill. He will take out all the machinery except the engine and stamps and try to work the ore by an electric process, which he claims will extract 90 per cent. He figures on beginning operations about Aug. 1st.

LAST DECEMBER F. E. Brightman was sent from a machine shop in Cleveland, Ohio, as general manager of the Gladstone mine, near French Gulch, Shasta Co. It was the first gold mine he had ever seen. He says he is doing all the clerical work, bossing the millmen, running $2 rock and paying expenses. Ten of the twenty stamps are in operation. There are very little sulphurets in the ore, and the chlorination works are not in use. Forty men are at work.

AT Grave Creek, near Grant's Pass, Or., last Monday, three men, Tracy, Auk and Dunham, appeared with rifles to jump a claim discovered and worked by E. and T. Browning, who warned them away. Tracy raised his rifle and advanced, when he was shot and killed by E. Browning.

THE Mineral Empire Mining and Investment Co. has incorporated in Butte, Montana, capital stock $262,000. The officers are: President, A. B. Keith; vice-president, W. E. Hollund of Chicago; secretary, R. S. Bickford; treasurer, John S. M. Neill. Mr. Bickford will open an office in Boston and Mr. Holland in Chicago.

AT the Ellery Bros.' mine, Dutch Gulch, Shasta Co., the quartz ledge varies from 6 in. to 2 ft., and averages $500 to the ton. The last 6 days' run cleaned up $2200. They have been offered $15,000 for the property, but claim they have $40,000 in sight. They have bought a one-fourth interest in the Saelzer, Fillman & Co. mine near Trinity Center.

AT the Brick Consolidated, in San Bernardino Co., ten stamps are crushing 17 tons per day, lack of water interfering with present operations. The shaft is now 540 feet deep. At Montgomery the Little Johnnie is turning out considerable bullion. H. Cannon, W. Langton and Orson Smith, of Utah, recently paid $75,000 for an interest in the latter mine.

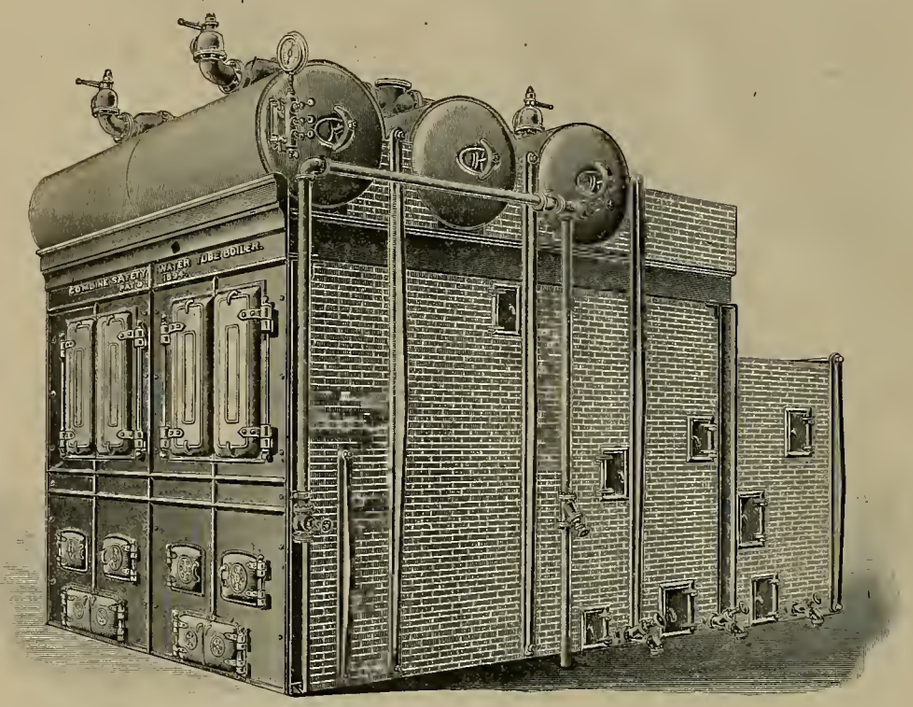
THE Elkhorn, Montana, Mining Company report in May the mill worked thirty days; crushed 1194 tons; bullion produced in the mill, $25,757; nineteen tons of smelting ore sold, $1500; total produce, $27,257; total expenses, $22,433; estimated profit for the month, $4824. The directors declared an interim dividend of six cents per share for the three months ending May 31.

A TRANSPORTATION WAR is being waged by Bingham, Utah, mine owners against the Rio Grande Western. Believing that the railroad rate on ores to the Salt Lake smelters was unreasonable, the miners have put twenty four-horse teams to work and are marketing their ores by wagon transportation. With a lower ore rate, the output of that camp would be doubled.

TO DATE, Slate Creek, the new mining camp on the summit of the Cascades, has cost Marcus Daly of Montana over $50,000. The money was spent in shoveling snow, negotiating for the bonding of property, etc. Col. Hart was the negotiator; he is in Arizona at present. Some good prospects are reported in Slate Creek, which, properly developed, may prove valuable.

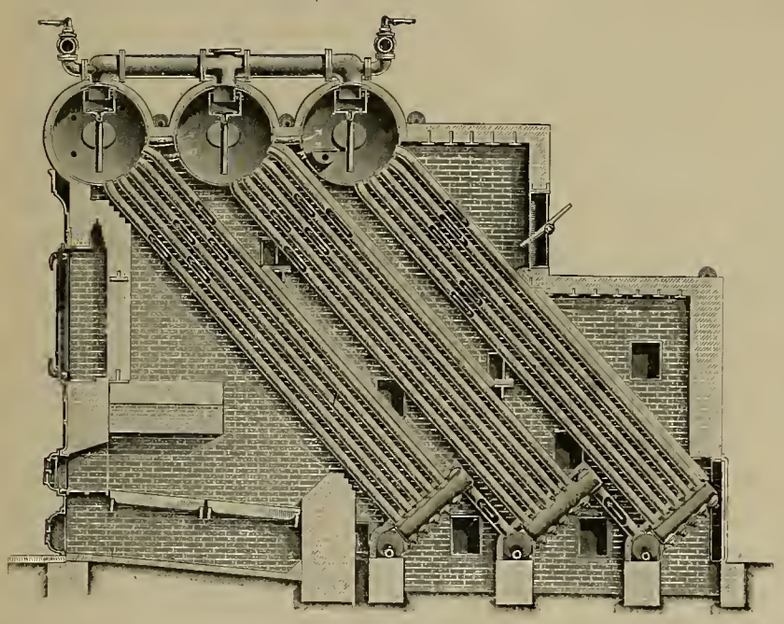
L. W. POPEJOY, of Denver, Col., has sued W. S. Stratton for a half interest in the latter's mines at Cripple Creek. He claims that he grub-staked the defendant, who discovered these mines in 1891, and that Stratton bought him out in July, 1891, for the amount of the grub-stake, and he only recently learned the value of the mines. The notice of the suit puts a lien upon fifty mines and town property in Colorado Springs, Victor and Cripple Creek.

WHAT, under the peculiar conditions, is said to be the fastest time ever made on a railroad in the United States, was recently run on the Santa Fe, Colorado Midland, and Midland Terminal, from Denver to Cripple Creek, Col., to bring a doctor to a sick miner there. The distance is 124 miles, and was covered in three hours and twenty minutes, counting in time occupied in making two transfers and stopping for water once. The time was 200 minutes, but when it is considered that the run was made over mountain roads, over highly graded curves, and other retarding influences, the run may be looked upon as phenomenal. From Denver to Colorado Springs the road winds about the broken country outlying the foothills, and as far as Palmer lake there is an uphill pull with a maximum one per cent grade for a distance of fifty miles. From that point to Colorado Springs it is down grade, and the distance from the Santa Fe yards in Denver to the station there is seventy-four miles. The conductor and the physician kept the time, and both timed the run, seventy-three minutes for the actual running time. At Colorado Springs another locomotive was in readiness and a quick transfer was made to the Colorado Midland, and the climb was commenced into the mountains, the hardest part of the run to be made. The road is built up a crooked canyon, and the prevailing grade is four per cent, and none less than three per cent. To Divide is a distance of twenty-eight miles. At that place a transfer was made to the Midland Terminal, having the same grade that prevails on the Colorado Midland, and a run of twenty-two miles made to Grasse, the Cripple Creek station. From the station to the cabin, where the miner was waiting the arrival of the physician, the distance was two miles. A carriage with two horses was in waiting, and over the mountain wagon road the driver landed the physician at the miner's bedside in ten minutes. Owing to the numerous and abrupt curvatures the engineer on the two last-named lines had to exercise caution, but the run the entire distance under the physical conditions is something most remarkable.



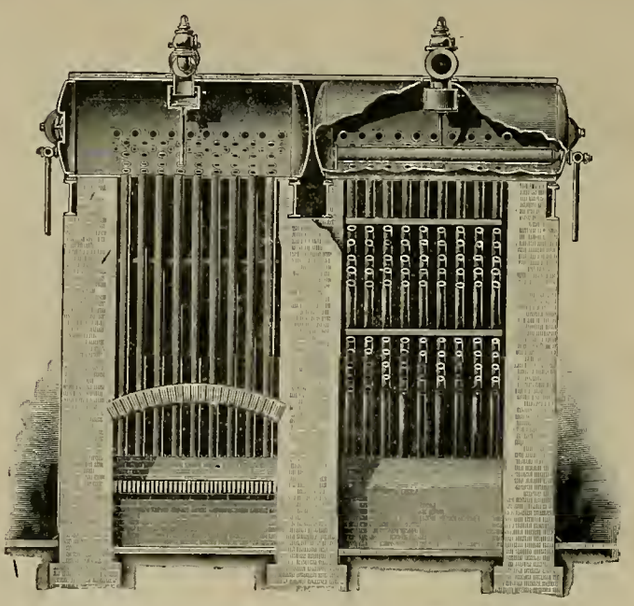
Obituary.

Thos. H. Huxley, the distinguished English scientist, died in London last Saturday in the 71st year of his age. Originally a surgeon, he took up the study of natural history and geology, and later in life, widened the area of his labors in general science. Like the late Prof. Proctor, he did much to make plain scientific truth, and popularized many of the theories and facts that he advocated. His writings were voluminous and in nearly every respect resulted in adding to the sum total of organized knowledge and general information. On evolution and kindred topics Prof. Huxley was an acknowledged authority. He is credited with having originated the term "agnostic," which defines that numerous class who neither deny nor affirm alleged religious truths, saying in effect, "I don't know." He occupied about the same place in the scientific world that our Prof. Davidson does. Unlike him, however, the British Government delighted to honor itself in doing him honor, and his great services and preeminent ability received fitting recognition throughout.



Prof. Huxley was devoid of veneration. He was not content with believing that anything was so, simply because some one else said so or saw it stated in some book. He investigated, sought Nature direct through its workings, was never content to know that a thing was so till he knew why; what made it so and how, and, as usual, incurred considerable censure from those whose comfortable conclusions he disturbed. He did service to mankind in general, and fully deserves the honorable remembrance in which his memory will be held by all thinking people.

Combine Safety Water Tube Boiler.



The water tube boiler illustrated herewith is patented and manufactured by L. M. Moyes, 411 and 413 Walnut street, Philadelphia. The boiler is sectional and of the class of the water tube type in which the steam and water drums are arranged and located transversely to the flow of gases from the furnace to the outtake to chimney. Mr. Moyes makes a very broad claim of continuous and positive circulation throughout the entire boiler system. The cuts show a perspective elevation of a battery of 616-horse power, a side elevation, showing an assembled boiler, transverse sections through the front steam and water drum and furnace and through the rear steam and water drum. The other figure shows a detail of tubes, manifolds and distributing drums assembled. The side elevation presents a good idea of the arrangement of the boiler; the tubes (standard 4 in. by 18 ft.) on an angle of about 45 degrees are expanded at the upper end into the tube sheet in steam drum, and the lower end into the tube seats in manifolds. The sections are connected to and with each other by circulating tubes set at the same angle as the tubes, and are five inches in diameter, each distributing drum having a separate blow-off valve. In operation of the boiler the gases, as will readily be seen, have a long contact with the heating surfaces in their flow from furnace to outtake. The circulation of water and flow of steam generated in the tube is upwards in the two forward sections into the two front drums, with ample disengaging space, thence by the connecting devices to the rear drum (into which the feed is also being delivered) downwards in the rear section to supply by the many connections the water of displacement. The connections between sections provide for all and every possible strain of expansions. The steam drums rest on I beams in such a manner as to remove all carrying

SIDE ELEVATION.

TRANSVERSE SECTIONS, THROUGH STEAM DRUMS.

strains from the tubes. The circulating and compensating tubes by which the steam drums are connected are shown in the side elevation, also the cross steam pipes on top of the drums, to which are attached safety valves. These cross pipes are of steel, with flanges cast on. Forethought is displayed in the facilities for the removal and replacement of damaged tubes. A tube from any section in the boiler can be easily removed without interfering with the adjoining tubes. The removal of a deposit from the inner surface of tubes is effected either by introducing the scraper at the lower end through the hand-hole or at the upper end from the steam drum. The smallest steam drum used on this boiler is forty-two inches in diameter, giving ample space for men to operate when cleaning tubes. The chamber at the lower end is also sufficiently roomy for the cleaning. The facilities for cleaning tubes have been based on the practice of many years' experience with this type of boiler. A specially designed scraper and handle is used. The cut of detail shows the manner of connecting the tubes to the manifolds, also the connections between manifolds and distributing drums. The hand-holes shown in distributing drums are covered and protected in the same manner as those in the manifold; the same fittings are used in both cases. There seem to be no departures from the established lines of the standard boilers of the water tube type. The assemblage of heating surfaces, the building up of the same with standard tubes, drums and manifolds, and their relation to each other, the travel of gases in contact with heating surfaces, the circulation of water and flow of steam are identical in their dispositions as in the better known boiler with which Mr. Moyes was for so many years connected. The boiler herein illustrated and briefly described is built in units ranging from 50-horse power to 600-horse power, and is capable of carrying a working pressure up to 200 pounds per square inch.

SECTION OF DETAILS.

In the great new American steamship St. Louis, which promises to be the forerunner of a magnificent fleet of American-built and American-devised trans-Atlantic liners, there are fully 1000 tons of piping of various kinds. The condensers pump 50,000,000 gallons of cooling water a day. The furnaces consume 7,500,000 cubic feet of air an hour. The boiler tubes, if placed in a straight line, would stretch nearly ten miles and the condenser tubes more than twenty-five miles. The total number of separate pieces of steel in the main structure of the ship is not less than 40,000, and the total number of cubic feet of timber used in the construction is more than 100,000. The total number of rivets is not far from 1,250,000. A marine engineer estimates that in a ship of this size, if all the steel which composes it were made into needles and placed in a line, they would reach more than ten times around the earth, or the distance to the moon, 240,000 miles. Another expert has estimated that if the ship were propelled by galley oarsmen, as in ancient times, it would require a force of 117,000 men continuously at work to develop the same power that the engines of this ship will produce.

Asbestos packing for valve stems and similar purposes is much improved for use by oiling it well with cylinder oil before putting it into place.

Treatment of Roasted Gold Ores by Means of Bromine.*

By RICHARD W. LODGE.

Mr. H. R. Batcheller, of the class of 1894, Massachusetts Institute of Technology, while experimenting with chlorine gas on a certain lot of roasted concentrates, met with the following difficulties: 1. A poor extraction of the gold. 2. A very large consumption of chlorine gas. 3. Inability to precipitate all of the gold from the solution containing the $AuCl_3$. 4. The bullion obtained was very base.

These difficulties were the same whether the chlorine was generated from H_2SO_4, MnO_2, and salt, or whether H_2SO_4 and bleaching powder were used. They may be accounted for partly by the presence of some arsenic left in the roasted ore, and partly by the presence of copper in the solution containing $AuCl_3$.

It was therefore suggested to try the effect of bromine on a similar lot of ore. The use of this element is, of course, nothing new, but in the following experiments it seemed to present many advantages over chlorine.

The material worked upon consisted of some concentrates containing 2.31 ounces of gold per ton, and 34.26 per cent of arsenic, which would correspond to about 74.4 per cent of arsenopyrite. Considerable pyrite and a small amount of galena and chalcopyrite were also present.

The material, when sized and assayed, showed:

	Per cent.	*Ozs. gold per ton.*
On 24-mesh sieve	.7	assaying 1.4
" 30 "	1.9	
" 40 "	3.5	" 1.2
" 50 "	6.0	
" 60 "	4.5	" 1.12
" 80 "	11.0	" 1.19
" 100 "	26.0	" 1.4
Through 100-mesh sieve	45.0	
Loss	1.4	
	100.0	

The line of treatment was as follows:

1. Roasting the concentrates in a reverberatory furnace.

2. Submitting the roasted ore to bromiuation in strong preserve jars, "lightning brand," with double gaskets, the jars and their contents being revolved during the experiment.

3. Precipitation of the gold by means of H_2S:

ROAST I.—TIME, FIVE HOURS.

	Kilos.	*Assay. Ozs. gold.*
Raw ore	10	2.31
Roasted ore	6	3.36
	Per cent.	*Per cent.*
Loss	40	12.7

BROMINATION.

Roasted ore	500 grammes.
Bromine	14.5 c.c.
Water	500 c.c.
Time	5½ hours.

Assay of tailings from two tests gave 0.30 and 0.32 ounces of gold. Based on the roasted ore, this would be an extraction of 90.7 per cent.

ROAST II.—TIME, EIGHT HOURS.

	Kilos.	*Assay. Ozs. gold.*
Raw ore	15	2.31
Roasted ore	8	4.20
	Per cent.	*Per cent.*
Loss	46.67	1

The following experiments were made to determine the proper amount of bromine for 500 grammes of ore:

Roasted ore. Grammes.	*Bromine. C.C.*	*Time. Hours.*	*Water C.C.*	*Extraction, based on assay of tailings. Per cent.*
500	3.0	5½	500	90.67
500	3.0	5½	500	89.27
500	1.5	5½	500	92.54
500	1.0	5½	500	81.35
500	0.5	5½	500	62.23
500	0.3	5½	500	60.00

The following were made to determine the shortest period of contact of ore and bromine, giving a good extraction:

Roasted ore. Grammes.	*Bromine. C.C.*	*Time. Hours.*	*Water. C.C.*	*Extraction, based on tailings. Per cent.*
500	1.5	5½	500	92.54
500	1.5	4½	500	88.00
500	1.5	3½	500	86.00
500	1.5	2	500	81.35
500	1.5	1	500	72.02

These tests seem to indicate that 1.5 c.c. of bromine, added to 500 grammes of ore in 500 c.c. of water, would effect in five and one-half hours an extraction of over 90 per cent of the gold in the ore.

To test these conclusions, a third roast was made:

ROAST III.—TIME, EIGHT HOURS. ORE COOLED IN FURNACE.

	Kilos.	*Assay. Ounces.*	*Arsenic. Per cent.*	*Sulphur. Per cent.*
Raw ore	70	2.31	34 26	
Roasted ore	43.7	3.58	0.11	0.34
	Per cent.	*Per cent.*		
Loss	37.6	3 3-10	99.67	

Of this roasted ore 15 kilos were treated with 45 c.c. of bromine in 15 kilos of water for four and one-half hours in a revolving keg. The tailings showed an extraction of 85.5 per cent.

As an exeess of bromine was present when the keg was opened, at the end of four and one-half hours, a second experiment was tried with ore, 15 kilos; bromine, 35 kilos; time, five and one-half hours; water, 15 kilos.

This showed an extraction of 92.18 per cent, based on the assay of the tailings. The actual gold recovered from the solution was only about 80 per cent, which may be accounted for by the presence of considerable copper in the solution.

The expulsion of the bromine from the solution seemed to be best brought about by means of SO_2. Air and steam were both tried, but with poor success. After the passage of SO_2, the solution was quite clear, although some gold would be precipitated on standing.

When the ore was chlorinated, the solution at this point, containing the $AuCl_3$, would be quite turbid, and evidently contained a large amount of base metals as chlorides. These would necessarily interfere with the complete precipitation of the gold, besides making the bullion base. Some base metals, such as copper, were also present in the bromine solution, but apparently not to such an extent; for the solution was clear.

The gold was finally precipitated by means of H_2S.

In the experiments on this particular ore, bromine seemed to have the followiug advantages over chlorine:

1. It extracted a much higher percentage than chlorine; the results being estimated, not only on the assay of the tailings, but also on the actual gold recovered.

2. It gave solutions much more free from base metals. This would be expected, especially where chlorine is generated by means of H_2SO_4 and bleaching powder, and the acid has a chance to act directly on the ore.

3. Less time is required to extract the gold.

4. The ease in using and comfort in handling is much greater.

As regards the comparative cost, the least amount of bromine which could be used on this ore with a successful extraction, appeared to be 0.3 per cent, or six pounds per ton. With bromine at 25 to 40 cents per pound, this would make the cost very high; but the cost of chlorination would certainly be still higher, as it was found necessary to use as high as ten per cent of lime and six per cent of H_2SO_4 to obtain even a fair extraction.

The Present Limitations of the Cyanide Process.*

By C. W. MERRILL.

The cyanide process in the United States, notwithstanding uumerous failures made under the direction of the owners of the patent rights and others, has now passed its experimental stage, and can, undoubtedly, be made successful when intelligently applied to suitable material.

Much, however, remains to be known as to the exact conditions under which this process is applicable to the treatment of gold-bearing ores. If the owners of the patent rights in this country have ever scientifically investigated the matter, they have never published any valuable information on the subject. Other parties who are now using the process (often independently of the patentees) have nothing to gain by publishing their experience; and, moreover, many of the chemical reactions described in the text-books refer to the use of solutions of potassium cyanide many times stronger than are used in the metallurgical process.

I have, therefore, ventured to outline iu the following paper some conclusions from laboratory and field investigations, hoping thereby to induce others to communicate their knowledge, and thus to give new light upon certain points which are as yet unsettled; also to call attention to matters which should be kept in view in considering the treatment of ores by this method; and, finally, to add what little I can to the knowledge now extant upon the subject.

Unless otherwise specified, the term ore, as used in this paper, will signify either ore or tailings.

The consideration of ores of which the silver forms an important factor of their value will be omitted, although there are good reasons for believing that, with some modifications, certain silver and silver-gold ores can be successfully treated.

Ores containing coarse gold, which is not easily soluble in potassium cyanide, should always have that portion of the gold extracted by concentration or amalgamation before leaching. This precaution being observed, out of some fifteen gold ores on which I have experimented not one has been found in which more than twenty-five per cent of the original value was left in the tailings after leaching with a solution of potassium cyanide. In some cases less than five per cent so remained, the average being about fifteen per cent. But often the decomposition of cyanide of potassium was so great as to prohibit the application of the process. The assertion of the patentees, which forms the basis of their original United States patent, to the effect that solutions containing cyanogen in a proportion not exceeding eight parts of cyanogen to 1000 parts of water (which is equivalent to a two per cent solution of potassium cyanide), will dissolve gold and silver in the ore, while leaving the base metals practically intact, is contrary to the fact, as a solution containing as little as one-half of one per cent or less of potassium cyanide will dissolve compounds of some of the base metals, and especially of copper, zinc and manganese, with the greatest facility.

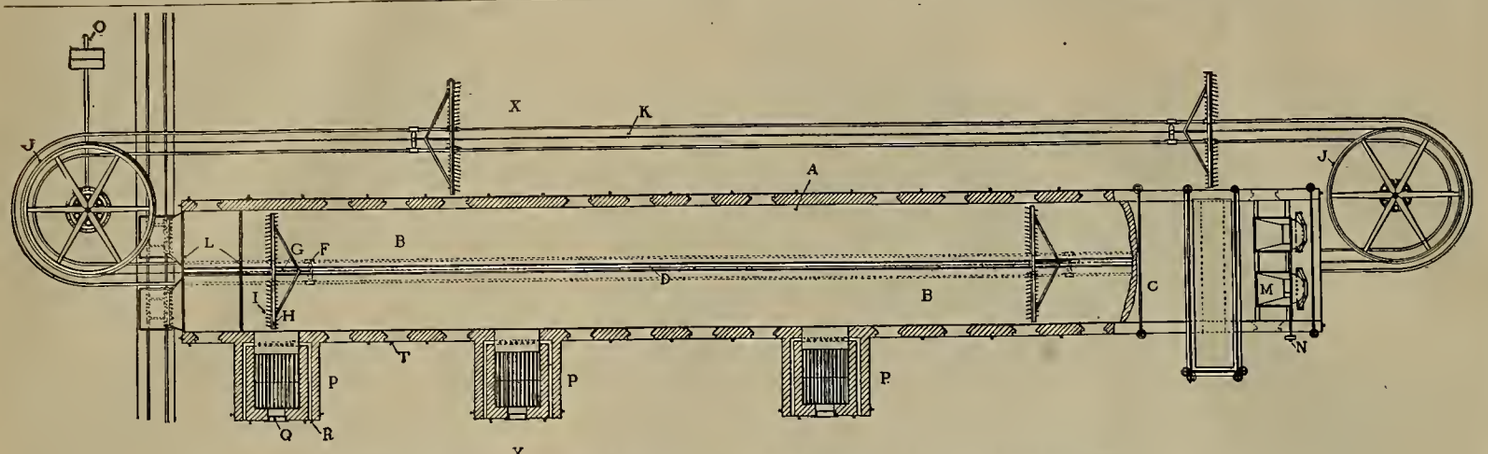
Of the ores unsuited to this process, some are so for chemical reasons. Of these cupriferous ores are especially to be mentioned. The great affinity of all copper minerals (save possibly the silicate, the phosphate and native copper) for cyanogen is the cause of a large consumptiou of cyanide of potassium, which is an expensive reagent. A means of recovering the cyanogen thus rendered useless has not as yet been devised. A few figures will illustrate this large cousumption. One pound of copper will combine with a little more than two pounds of potassium cyanide to form the double cyanide of copper and potassium; therefore, if an ore contains as little as one-half of one per cent, or ten pounds per ton of copper, in a mineral form which is soluble iu the solution used, the amount of cyanide of potassium rendered useless will be more than twenty pounds, costing, at fifty cents a pound, more than ten dollars.

The same line of reasoning applies to oxidized zinc-bearing ores, but the affinity for cyanogen does not seem to be as great in zinc minerals as iu those of copper.

The consumption of potassium cyanide occasioned by the presence of certain compounds of iron and manganese can sometimes be obviated, to a great extent, by mixing lime with the ore; but at other times there is, in leaching partially oxidized pyritic ore, a consumption of potassium cyanide which the use of lime will not overcome. There is no precise information available as to the mineralogical or chemical conditions under which these differences occur.

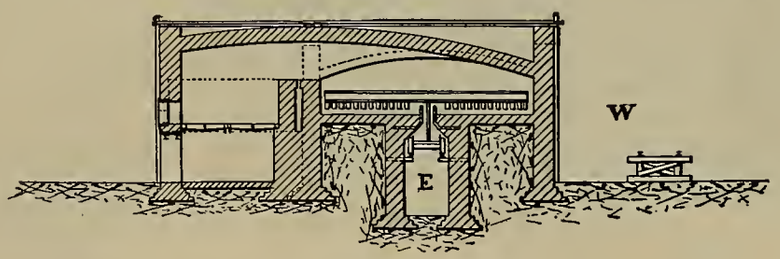
Other ores offer difficulties because of their physical nature. This is the case with ores naturally soft and slimy, and yet not porous enough to give a good extraction when crushed coarse By fine crushing these are rendered so impermeable to the solution that successful leaching is impossible.

Similarly, the treatment of slimes which have become segregated from the sandy constituents of the ore has not, as yet, been solved in a practical manner.



Furthermore, there is a class of roasted material in the roasting of which the temperature was so high as to fuse the minerals in which the gold occurs, thus so imprisoning the gold as to render it incapable of being dissolved by the cyanide solution.

Coming now to the, as yet, undetermined class of ores, trustworthy information from continuous working of large quantities is still lacking in regard to the behavior toward cyanide solutions of ores containing galena, zinc-blende or oxidized lead compounds, also of telluride ores and unoxidized pyritic ores. Their adaptability to the treatment will depend, in the first place, upon the condition in which the gold is present (whether distinct from the base metals or chemically or intimately combined with the latter), and, in the second place, upon the solubility of the base metals in a solution of potassium cyanide of a strength sufficient to extract the gold. Where this solubility exists to any great exteut the consumption of potassium cyanide will render the process unavailable. Moreover, the solubility of the base metals entails other evil effects besides the chemical loss of potassium cyanide. As the solution becomes fouled by their presence, its extractive power becomes weakened, even though the normal percentage of active cyanogen be maintained by the addition of fresh quantities of potassium cyanide. Again, the gold and silver contained in solutions of this kind are imperfectly precipitated in contact with metallic zinc. The zinc filaments used in practice for precipitating the precious metals become incrusted with a deposit which prevents their further action to such au extent that, as has happened in a large plant erected for the cyanide process, the solution, after it has been used on the ore a few times, will flow out of the zinc boxes almost as rich as it went in, causing, with other difficulties in the treatment, the failure of the process.



The class of ores suitable for this process comprises all oxidized ores which are not included in the above classes, also roasted tailings from which the coarse gold has been removed, and which do not contain such compounds of the base metals as will consume too large a quantity of potassium cyanide; and, finally, strictly quartzose or siliceous ores in which a considerable quantity of fine gold remains after amalgamation. A small percentage of pyrites in such cases will not prove an insurmountable objection.

In conclusion, it may be said that, as far as known at present, only those ores can be economically treated which will readily yield a fair percentage of their gold contents to the action of weak solutions of potassium cyanide, and which contain no appreciable quantity of base-metal compounds soluble in such weak solutions. While strong solutions will extract a high percentage of the value from a much larger class of ores, no method has as yet been made known

for overcoming the excessive chemical consumption and the consequent fouling of the solution accompanying their use.

In deciding upon the application of the cyanide process to the treatment of a new ore, it is therefore not sufficient to know, in a general way, tbat a high percentage of the gold is soluble in potassium cyanide. The minimum strength of solution which will be required to obtain satisfactory results, and the unavoidable loss of potassium cyanide by chemical decomposition, should be carefully ascertained by laboratory tests, as well as the permeability of the crushed ore to the leaching solution. An investigation should also be made to determine the ability of zinc to precipitate the precious metals after continued use of both the solution and the zinc.

The Necessity for Competent Geological Surveys of Gold Mines.

On the 14tb ult., Nicol Brown, F. G. S., read a paper with the above title at a meeting of the Geologists' Association of London, in which he said that geology in competent hands is the first science for gold mining, and that no sure foundation is laid for other sciences to base their work unless the preliminary work of the geologist be well done. Whether a man goes to seek fossil shells or golden sands the same qualities are required for success, the same iutimate knowledge of nature and nature's laws, without which ber thrilling secrets cannot be discovered. From the want of this knowledge the ordinary uninstructed gold seeker always defeats the end he has in view. He works hastily and by imperfect methods, aud never stops to mark the finger posts or compass points which might guide him to the object of his search. The finding of gold must uo longer be left to chance, but should be the result of well-designed and well-organized efforts, and the basis of that industry, which is now being built up, rests ou geological surveys made by qualified men. These are now demanded and must be obtained, and the gold miners can well afford to pay for them, and at a different rate from what bitherto has been paid.

Directors of gold mining companies have considerable difficulties to encounter in selecting employes who understamd the various departments of the work. To the uninitiated these latter appear complicated; but in reality they are simple to those who take the trouble to spend the time and labor to learn about them. Directors of gold mining companies should, however, themselves learn how to appoint their staff, and to control them by allocating to them tbeir work in such a way as to get the best results. Instead of this, their aim has been to get what they call an "all-around" man, and thus try to shift the respousibility off their shoulders. Owing to the confusion existing in the minds of such unskilled persons as to the proper administration of gold mines, the work of the different departments has often been hopelessly mixed. By these persons the manager is expected to be a geologist. a miner, a mechanic, a chemist, and a business administrator, all rolled into one; but evidently this leads to failure. Psuedo-geologists, without adequate knowledge, have been often employed to survey and report on the properties. Incapable persons also have been entrusted to do the industrial part of the work of mining, milling, and saving the gold. All this blundering results in heavy loss. So largely has this been the case from the earliest times, that those who have taken the trouble to inquire into the facts, taking good and bad mines alike, have often made the statement that gold costs more to produce than it is worth. Proper geological surveys, not only of the gold-bearing veins or beds, but of the enclosing rocks, must now take place of the old prospector's empirical work in order to prepare the field for the tools of the workers of the mines, who cannot otherwise proceed intelligently with their operations. The costs of preliminary and concurrent surveys by competent geologists should always be provided for in any gold mining scheme. The expense of such surveys will be infinitesimal, compared with the money thrown away in times past on many expensive, abortive, El Dorado-like schemes.

The mining operations should be uuder the control of an educated and experienced mining superintendent. He must be a practical miner, and should have had experience in mining various ores in different parts of the world. It is a great disadvantage to employ a miner whose prejudices have been developed by long experience in one particular series of rocks or of the physical structure of one country. Such a man, bowever capable otherwise, has no resources when he comes to deal with new geological conditions. Unfortunately, many good mines have been condemned by such men. The various methods of gold mining naturally depend on the formation of the gold-bearing rocks. The operations oftcn reveal sections of the earth's crust, which, when noted by the thoughtful geologist, lead to further following up of the payable deposits; if, however, these sections are left unnoticed and unrecorded, rich opportunities are thrown away.

Having "torn up the mountains by the roots," as mining was described in the book of Job, and brought the ore "to grass," the next operation is to mechanically crush it, in order to free the gold from the gangue; there is no evidence of this operation having been attempted by the ancients. The stone-breakers, mechanical hammers and various crushing appliances of all kinds do on an artificial scale what the earth movements, the sea, ice, frost and rivers have always done with the rocks on a natural scale. The California stamp mill for crushing the ore is an improvement in detail and adaptability on the old Cornish mill used in tin stamping, whicn has been in vogue since the seventeenth century. By these stamp mills, which are at present the chief means of crushing, the ore is reduced to a fine state of subdivision, and the battery is flushed with water to act as a carrier of the finely-divided ore or pulp from under the hammers. The pulp is carried over plates coated with mercury, which catches a certain amount of gold, and so saves it in the form of an amalgam of gold and mercury. The general result of this treatment is great loss in float gold, and loss of gold in slimes. A newer method, which is now attracting much attention, but may not be applicable to all kinds of ores, is to crush the ore dry, and this makes the product easier to deal with, when a percolation chemical process is used for dissolving the gold out of the ore, instead of taking it out by amalgamation with mercury.

The lecturer said that it was his aim to show that the chance of men finding much gold in massive nuggets, and becoming suddenly rich, has forever vanished. To continue the necessary supply of gold to carry on the ever-extending commerce of the world,

a vast industry of the first importance, aided by many sciences, is needed to gather out the infinitely small scattered portions of gold as they exist in Nature. The product in gold of the industry which has recently sprung up will afford relief to the straightened currency of the world; and as it can now be produced with industrial and scientific certainty, the result to the world will in the near future be very great. Men cannot now-a-days keep slaves to work their gold mines as of old; but, always provided that they work upon the basis of proper geological surveys, the mining, the mechanical, the electrical engineers, and the metallurgical chemists, with all the far-reaching fingers of their various sciences, can gather out the countless small particles of gold from the rock matrices. Industry must be set off against industry; our future gold, got by well-directed industry, will represent the result of honest men's toil.

Annual Mint Accounting.

The following is from the San Francisco *Chronicle* of the 3rd inst.:

The annual accounting and department settlements at the United States Mint in this city was begun yesterday. This important work, involving millions of dollars, is annually supervised by special agents appointed by the Director of the Mint. The agents designated for this work this year are J. Farley Wilder and H. W. Van Sendem. The former is assayer of the New York assay office, and began the ordinary detail work yesterday. Mr. Van Sendem is the private secretary to Secretary Carlisle, and is expected here in a few days. Superintendent of the Mint Daggett, who has been out of the city since June 8th, reached home from Siskiyou county on Monday in time to meet these special agents.

The year, which ended at midnight on Sunday, was a very active one in the local mint. The total coinage aggregated 8,401,011 pieces, of the value of $24,920,110.25. Of this 1,147,450 pieces were gold, of the value of $21,395,500, and 7,258,561 pieces in silver, of the value of $3,524,610.25. The report just rendered by the coiner would indicate that the popular notion that the coinage of standard silver dollars had been suspended is entirely erroneous. It shows that 1,600,000 of these dollars were coined during the past year. The detailed statement of the work of the coinage department for the fiscal year just closed is as follows:

Compared with past years this shows a considerable increase over the year 1893-94 in both silver and gold, and also over 1892-93. In the latter year only $1,284,000 was coined in silver, as against $3,524,610 for the year just closed. In 1893-94 only 4,739,000 pieces were coined, as against 8,401,000 pieces for the year just closed, indicating double the amount of work. The increase in the coinage of standard dollars is exceptionally large. In 1892-93 but 700,500 were coined; in 1893-94 none whatever, as against 1,600,000 last year. A telegraphic report just sent out from Washington states that, in the month of June, the coinage executed at the several mints was: Gold, $1,750,000; silver, $440,044; minor coins, $71,200; total, $2,261,244. During the month the San Francisco Mint turned out $1,670,000 in gold, or nearly the entire product of the country; and $160,000 in silver, about one-third of the total silver coinage.

The business of the Mint is not conducted on a basis of the face value of the coins produced, but by ounces wholly. The chief coiner receives from the melter and refiner standard ingots, from which coin is to be manufactured in conformity with the standard weight provided by law.

Denomination—	*Pieces.*	*Value.*
Gold.		
Double-eagles	1,083,800	$20,716,000 00
Eagles	24,250	242,500 00
Half-eagles	87,400	437,000 00
Total gold	1,147,450	$21,395,500 00
Silver.		
Dollars	1,660,000	$1,660,000 00
Half-dollars	2,536,880	1,268,440 00
Quarter-dollars	1,936,681	484,170 25
Dimes	1,120,000	112,000 00
Total silver	7,253,561	$3,524,610 25
Total coinage	8,401,011	24,920,110 25

The operations in gold workings apply in the main to those of silver, and in the process of rolling, cutting, milling and cleaning to the base coinage also. The latter includes nickels and pennies, which are not made here. The gold ingots, after they are received, are taken to the rolling room, each melt being kept separate. The first process is that of reducing the ingots to strips or fillets of a proper thickness. Eight drafts are had upon the rolls previous to annealing and three subsequent. The strips are then reduced to a proper thickness for the next operation, which is upon the draw bench. The annealing of the gold fillets is done in copper cannisters, rendered air-tight by potters' clay. When the cannisters have been taken from the furnace they are placed in water to cool. After the fillet is cut and annealed a second time it is pointed with the pointing rolls and is then ready for the draw bench. When the fillets have been scientifically reduced, a few planchets are cut from both ends of a fillet and weighed. These testings are continued until the planchets so produced conform to the working tolerance, which is from standard to one-quarter or three-eighths of a grain heavy. The fillets then pass to the cutters, and when the planchets are cut they are sent in lots of $15,000 to the adjusting room. The planchets are delivered to each adjuster in small tin pans, numbered to correspond with the seat occupied by the female adjusters, each adjuster receiving about 250 planchets at a time. In front of each adjuster stands a delicately adjusted balance, sensitive to the one sixty-fourth of a grain weight. All planchets that deviate beyond the allowance shown in the foregoing table are rejected as "condemned lights," and the remaining are separated into "lights" and "standards," to be united in proper proportions with the "heavies." When again adjusted the planchets are weighed with the filings and the loss carefully noted. Perfect record of all wastage is kept in every department through which the coin passes.

From the adjusting room until the planchets are returned to the weigh room as coin the lights, heavies and standards are kept separate. These are then united by the chief weigher in drafts of $5000 so as to give in delivery a uniform standard of 268.75 ounces troy for each draft of gold. If the further tests prove satisfactory the chief coiner notifies the treasurer that the given amount in a given denomination of gold is ready for delivery. The trial pieces are placed with a memorandum stating date, amount and character of the delivery in a linen envelope with the seal of the assayer. This envelope is placed in a secure box called the pyx, to which there are two keys, one being kept by the treasurer and the other by the assayer. This pyx is kept sealed until the annual assay, when it is opened by the commissioners appointed by the Director of the Mint to examine into the accuracy of the work for the year previous.

This is the work which Messrs. Wilder and Van Sendem are to perform in connection with other duties. Pending the annual accounting all business at the Mint is suspended, sweepings are carefully treated and assayed, and the gold and silver are accounted for within a fraction of a grain. The work is an important one, and usually causes commotion among the Mint employes, entailing on all the hardest labor for the year.

The pieces coined really tells the work done by the mints. It costs almost as much labor to coin a silver ten-cent piece as a twenty-dollar gold piece. The following table gives an idea of the relative labor involved in coinage, all coins being packed in standard, full boxes:

Denomination.	*Pieces to full boxes.*
Gold.	
Double eagles	1,000 pieces
Eagles	2,000 pieces
Half eagles	4,000 pieces
Silver.	
Standard dollars	1,000 pieces
Half dollars	2,250 pieces
Quarter dollars	4,500 pieces
Dimes	11,000 pieces

The following is the standard table now in use in the mints of the country as the weights of a given amount of coin:

Amount.	*Weight, Ounces, Dec.*
GOLD.	
$ 20	1.07½
5,000	268.75
10,000	537.50
20,000	1,075.00
30,000	1,612.50
40,000	2,150.00
50,000	2,687.50
SILVER.	
Silver Dollars.	
$1,000	859.375
10,000	8,593.75
20,000	17,187.50
40,000	34,375.00
50,000	42,968.75
Half-Dollars, Quarters, Dimes.	
$1,000	803.75
5,000	4,018.75
10,000	8,037.50
20,000	16,075.00
30,000	24,112.50
40,000	32,150.00
50,000	40,187.50

It will be noted that there is considerable discrepancy in weight between $1000 in standard silver dollars and $1000 in half-dollars. This is due to the act of 1853, under which subsidiary coin is made. At that time silver was comparatively high, and foreign Governments drained it out of the country. To stop exports the standard was lowered, and has remained there ever since.

Coast Industrial Notes.

—The Pacific Rolling Mills have a contract to supply 30,000 fish bolts for the Valley road.

—A prune crop of 10,000,000 pounds is the estimate for Oregon, Washington and Idaho this season.

—Last week's big fire in this city entailed a loss of $800,000. The insurance aggregates about $300,000.

—The Golden Gate Woolen Mills have a government contract for 6000 blankets, to be sent to Philadelphia.

—H. D. Morris & Co. have placed a 14x22 Rand compressor and drills for the Merced G. M. Co. at Coulterville.

—The Puget Sound Lumber Association advanced the price of cedar lumber $1 to $3 per thousand feet for rail shipments.

—The Joshua Hendy Machine Works are putting in a double steam hoisting engine, boiler 60 in. by 16 ft., at the Standard mine, Oregon City, Butte Co.

—The Juneau *Mining Record* advocates the regulation of salmon fishing, and thinks that if something is not done soon the great Alaskan industry will suffer irretrievable injury.

—The entire output of quicksilver of the United States is mined in California, the total quicksilver product of this State to date amounting to 1,700,000 flasks, valued at $80,000,000. California produces about 40,000 tons of asphaltum, or 90 per cent of the total product of the United States, annually.

—The Pacific Shoe Company adopted the profit-sharing plan. The employes, in addition to the wages they receive, share in the profits of the business. The company employs about thirty persons.

—Two extensive lime works are constantly at work on San Juan island. One runs three kilns and turns out 120 barrels each day on an average. The other runs two kilns at present, and produces about the same amount.

—Since February 1st 5420 carloads of fruit have been marketed by the southern California fruit exchanges; of these 90 per cent have been oranges. It is estimated that the orange crop for this year has brought $1,850,000 to the growers.

—C. N. Beal, Bakersfield, Cal., representing the Power Development Company, asks for segregated bids for the electric plant to which previous detailed reference has been made. The bids are all to be in August 1st; the contract to be let September 15th.

—The Nevada County Electric Power Company have contracted for an electric plant of sufficient capacity to deliver 800 H. P. at Nevada City. Besides furnishing power to 50 or 60 mines, it is intended to build an electric railway between Nevada City and Grass Valley.

—In the suit of the U. S. Government against the Leland Stanford estate for $15,000,000, Judge Ross last Saturday decided that the C. P. stockholders or owners were not individually liable to the Government for the debts of the road, and sustained the demurrer, a defeat for the Government. An appeal will be filed forthwith.

—The cruiser Olympia, built by the Union Iron Works, was inspected during the last ten days by the United States Naval Board and after a rigid test pronounced thoroughly satisfactory, which effectually disposes of the rumors of top-heaviness, etc., which were given in the eastern and some coast papers. The Olympia goes to Mare Island next week to await orders.

—Bishop T. Taylor, of Cedar City, Utah, offers to manufacture all of the steel rails, spikes, fish plates, switches and other appliances necessary for the new railroad lines from Durango (Colorado), Flagstaff, Phœnix and Yuma to San Diego, at the iron works at Cedar City, from iron made from ores taken out of the mines at that place, and with coal mined there; and also to furnish 1,500,000 tons of good coal per annum, delivered on board of the cars at Cedar City, for $1.50 per ton.

—At Harbor View last Sunday, R. T. Rolfson gave exhibition of a test of his new gas engine, which, so far as known, is the first one of the kind built. It is reversible, the crankshaft connected direct with the propeller shaft without any intermediate gearing in marine use. The new engine will be put into the Albert R., now building at Sausalito, and its workings will be of interest to many who have given considerable thought to the idea to which Mr. Rolfson claims to have given successful result.

—It is announced that A. A. Robinson, president of the Mexican Central Railroad, has resumed the presidency of the Atchison, Topeka & Santa Fe, and that he is to receive a salary of $60,000 a year, which is $25,000 more than he has been receiving from the Mexican Central Company. He returns to the Santa Fe with the understanding that he is to have full management of the property, and that all his decisions and acts in regard to all traffic and financial affairs of the property must be final and not interfered with by the board of directors.

—George Ames, of the Union Iron Works (who recently closed a contract with the Anaconda Company to furnish two of the largest hoisting engines ever constructed for use in two of the syndicate mines, of the latest pattern and capable of sinking 6000 feet), has a contract to furnish the refinery at Anaconda with two of the largest engines ever constructed—triple expansion Corliss engines, with a rating of 900-horse power each. The company will also furnish three mammoth steam stamps and several Bruckner furnaces, the whole amounting to about 700 tons of machinery, requiring thirty-five railroad cars for transportation.

—The *Railway Age*, being duly sworn, doth solemnly aver that "out in San Francisco they are laughing at one of the amateur directors of the company of merchants that has resolved to build a competing railway into the San Joaquin valley. The story is that at a meeting of the board to discuss the question of buying material, one director inquired, 'How much will fish plates cost?' Whereupon he was rebuked by a brother director for irrelevancy, because the time had not come to discuss 'the cost of dining car equipment!'" The railway journals published east of the Rockies have pooh-poohed the Valley Road right along, and have pretended to consider it a good joke.

—The $6,000,000 dredging contract between the Seattle South Canal and the Lake Washington Waterway Company and the Bowers Dredging Company, signed last week, is the largest dredging contract ever awarded to one firm in this country. The contract calls for the excavation of 35,000,000 cubic yards of earth, of which 9,000,000 yards are to be dredged from the waterways through the Seattle tide lands and 26,000,000 taken out of the three-mile canal connecting Lake Washington and Puget Sound. The company has five years in which to do the work, and expects to keep the large dredgers busy on it for most of that time. The earth excavated will fill in 2000 acres of tide flats.

—It is expected at the Cascade locks on the Columbia river, Oregon, that boats will pass through by Jan. 1, '96. For many years work on these locks has been dragged along and an immense amount of money has been expended by the engineers who were put in charge by the department. More has been accomplished during the past year than in any similar time before. The freight on wool from Pendleton to the Atlantic coast is now $1.65 per 100. From The Dalles it is 95 cents to the same points. The wool which goes to Boston from The Dalles goes through Pendleton, so that in the same train may be two cars of wool, one from The Dalles at 95 cents per 100, and one from Pendleton at $1.65, and yet The Dalles is more than 100 miles west of Pendleton.

—It is reported on the Sound that the Western Union is making arrangements to take possession of the old abandoned telegraph line now extending through British Columbia and Alaska, started thirty years ago to run to Europe via Behring straits and Siberia. Thirty years ago, before the Atlantic cable was laid, this line was constructed as part of a great world-circling line, which was to pass through Alaska, cross the narrow Behring straits, span the wilderness of Siberia, and connect Europe with America. The success of the cable spoiled this plan, and the line into the Cariboo country was abandoned many years ago. Now it is proposed to repair the old line and extend it north to Forty-mile creek on the Yukon and run branch lines to Sitka and Juneau, thus putting Alaska in touch with the great world from which it is now isolated. Nothing now remains of the several hundreds of miles of line stretched in British Columbia and Alaska but the rotted stumps of poles. The Indians long since took the wires and used them for making salmon nets.

Scientific Progress.

The Greatest of Modern Problems.

The problem of mankind—the economical production of energy—has been attacked on all sides by some of our most eminent scientists. It is openly confessed, says *Machinery*, that some other method than the mere combustion of fuel is necessary in order to obtain a greater percentage of its stored energy. Osmose—hitherto a superficially treated subject—is a rich field for the investigator. The pressure set up by a body when dissolving in a liquid, or a solution when mixing with water, may assume an enormous value. Common sea water acts with a pressure of 300 pounds per square inch in its tendency to mix with pure water. It is the substance in solution that causes this pressure, and it is true for all dissolved substances. The resolution of the theory of the primary cell to such a basis places us on a more substantial footing than ever before. Dr. Ostwald shows the parallel relationship existing between osmotic and electrical pressure. In other words, to obtain great E. M. F. from a cell, we must select two materials as elements with the greatest difference of osmotic pressures.

Now, Dr. Ostwald says that "the zinc and copper of the Daniell cell are two such sources of current of different potential, and the difference of their electrical pressure is based on the difference of osmotic pressure with which the zinc ions and copper ions are respectively endowed." A factor that will affect these conditions is the electrolyte. An electrolyte must be chosen whose reactive effect when charged with zinc ions will be least, while for the other electrode it will be greatest. By this means we are best prepared to make the most efficient combination with the elements at our command. In this introduction to the subject of consumption the inefficiency of a steam plant, the loss of ninety per cent of the energy of the fuel is due to the difference in temperature between the fire and boiler. Upon presenting this fact to our recollection, Dr. Ostwald points out a method for obtaining the chemical energy of the coal without heat. He shows that the application of an acid to the zinc in a zinc and platinum cell is not productive of the greatest E. M. F. The greatest electrical effort is produced by the acid being applied to the passive electrode. From this principle he contemplates the possibility of oxidizing coal—not by the oxygen in direct contact with the coal, but by the interposition of an unconsumable electrolyte. By this unexpected means the entire chemical energy of coal may be utilized, and in a manner so subtile and refined that no visible sign will appear of such an intense action.

Dimensions of the Universe.

While it is interesting to know the distance of some of the stars in miles, when stated in that way the numbers are so large that they convey very indistinct conceptions to the mind. For this reason it is customary to estimate star distances in "light years." A light year is the distance that light moving at the rate of 186,300 miles per second travels in one year. This amounts in round numbers to 5,880,000,000,000 miles. The distance of Alpha Centauri is 4.35 light years; that of Sirius, the Dog Star, is almost exactly twice as great, or 8.6 light years; that is, light requires 8.9 years to come to us from Sirius. And these are among the very nearest of the stars. Some, whose parallaxes have been rather estimated than measured, appear to be situated at a distance which light could not traverse in less than one or two centuries. The great star Arcturus, for instance, has, according to Dr. Elkin, a parallax of only eighteen one-thousands of a second. Its distance must, in that case, be about 181 light years, or more than a thousand million million miles. And if its distance is so great, then since light varies inversely as the square of the distance from its source, it can be shown that Arcturus must actually give forth 5000 or 6000 times as much light as the sun yields. Yet Arcturus is evidently much nearer than the vast majority of the stars are. Not one in a million is known to have a parallax large enough even to be intelligently guessed at. There may be stars whose light requires thousands instead of hundreds of years to cross the space separating them from us.

We thus see that only a few points on the nearer shores of the starry universe lie within reach of our measurements; here and there a jutting headland, while behind stretches the vast expanse over which the hundreds of millions of stars known to exist are scattered.

Origin of Light.

Prof. Dewar says that oxygen is highly phosphorescent; that under certain conditions oxygen will give off a steady light. This is a suggestion as to the origin and nature of light. The proportion of oxygen increases nearer the earth's surface and so does the intensity of light. As we ascend in the atmosphere, light and the proportion of oxygen to other gases decrease in nearly the same ratio. The force which radiates from the sun in straight lines comes in contact with the oxygen of our atmosphere, and it is argued this combined action ignites the carbon gases, producing light. This subject is not yet fully understood, but investigators are pushing their work, and it may yet be demonstrated that light originates in our atmosphere and does not come from the sun; that force comes from the sun, and that force wakes light by burning the gases within our atmosphere.

THE Kiel ship canal opened last week, and is about 61 miles long, 20 feet deep at dead low water and 229 feet wide. In numerous places the canal widens out to 428 feet to allow the largest vessels to pass each other. Work will be continued until vessels of any depth can pass at low water. The embankment is stone lined to a depth of six feet below the water. The locks at the North Sea end of the canal are the largest in the world with the exception of that at Bremerhaven. While no high hills interfered with the work, considerable difficulty was experienced in leading the railroad across the canal. Two of the bridges span the canal at a height of 137 feet above the water, besides which there are six opening bridges and sixteen ferries. The canal cost $39,000,000.

IN an article in the *Century Magazine*, Mr. Maxim says that, before selecting his motive power for his flying machine, he went carefully into the subject of weights of all kinds of motors. He found that the weights per indicated horse power were: Hot air engine, 200 pounds; oil engine, 75 pounds; electric motors, fed by secondary batteries, 130 pounds; Otto system, 50 pounds; marine engines, with condenser pump and everything complete, from 25 to 50 pounds per horse power. He uses a steam engine with boiler, gas generator, pump and 200 pounds of water, which weighs only 5.6 pounds to the indicated horse power.

NOW THAT Chicago's $25,000,000 drainage canal approaches completion, a commission makes the curious statement that the shallowing of the lakes occasioned by the diverted flow will diminish the annual earnings of the lake fleet over $1,700,000.

THE American Association for the Advancement of Science will hold its next session in Springfield, Mass., beginning August 28th and extending to September 7th.

IN the fiords on the Norway coast the clearness of the water is wonderful. Objects the size of a half dollar may be seen at a depth of twenty-five fathoms.

Mechanical Progress.

Water in Steam Pipes.

Prof. Thurston says: I know a case where the steam pipe was not sufficiently drained, and the water collected in the pipe and was carried over into the cylinder of the engine, wrecking it. Large stresses must be produced, and it would be interesting to observe how large these stresses are. No one has yet found a way of ascertaining them accurately. The fact that such accidents do occur, unquestionably due to the impact produced by the rapid condensation of steam on the surface of a pool of cold water, shows that these stresses must be enormously great. What may happen if a rapidly moving, heavy mass of solid water, in full career, strikes an obstruction we all know; but the hammering of steam in pipes produces a local strain probably quite as severe, perhaps even more serious.

This second kind of strain is known to be enormously great, but how much we do not know. He had occasion once to examine a quantity of pipe taken out of a heating system then in operation, but now extinct. He was informed that the pipes were defective, and was asked to examine them for the purpose of obtaining a report to secure from the makers a reduction of their cost and possibly damages. Many of the pipes were split through good welds and had welds, through solid iron even, and the only report he could make was that they were injured by water hammer. A quantity of the pipe was taken to the mill, where it was made, and the pressures they would stand were measured, split and weakened as they were. In order to obtain a fair idea of the actual pressures that the pipes would sustain, a rubber packing was arranged on the inside of each pipe, a strip covering each crack from end to end, drilling a few holes along the crack, so that the strength of the pipe should not be affected, and to insure that sealing these joints should not affect the strength of the pipe. The bolts simply hold that packing up against the crack on the inside, so as to seal it by the slight pressure of a line of small bolts which were put simply to hold the packing in place. Pipes arranged in this way, and tested in the hydraulic apparatus of the mill, carried all the way from 300 to 1000 pounds pressure to the square inch, injured as they were. The conclusion was obvious that the water hammer to which they had been subjected was enormously in excess of these figures, representing the strength of the pipe after the crack had been made.

These facts are more impressive than any possible examination, without actual measurement of these quantities, and reveal the intensities of the strains that occur, and the risks of danger which occur from allowing water to stand anywhere in a pipe. After water had once collected in a pipe, especially in steam pipes leading to engines of larger size, there is no way of removing this danger except by simply shutting the steam off at once, if it is moving in the pipe, or keeping the throttle shut, if it is not moving; then let the steam down and drain the pipe completely before steam is again put on.

Horseless Road Carriages.

For several years inventors and manufacturers have been trying to devise vehicles for common highways which might be propelled by steam, gas, compressed air or electricity for several hours without interruption. There is a growing demand for such carriages, and in time it will be met in a satisfactory manner. In a competitive trial held in France last year, there were twenty-six entries. Tests of speed were made on roads running out of Paris in various directions, and the honors were divided between steam and gasoline engines as propelling agents. However, it should be added that there was only one carriage relying on electricity derived from a storage battery in that contest. So great was the interest developed that a fresh competition was soon arranged for this year; it was held last week. A race in which fifteen carriages took part, and extending over the common highway from Paris to Bordeaux and return, afforded a more thorough, though by no means conclusive, test of the various systems. The distance traveled was 730 miles altogether. The best time both ways was made by a carriage driven by a "petroleum motor," and making an average speed of fifteen miles for forty-nine hours. The next three carriages to arrive were also propelled by the same means. Definite information regarding the mechanism used this year is not at hand, but the "petroleum motors" last year were really gasoline engines, arranged either in front of the dashboard or under the rear seat. The smell of the escaping vapor was unpleasant, and the carriage had a perceptible vibration while stopping on the road, owing to the action of the flywheel. Efficient as the storage battery is in propelling boats, its structure does not at present seem to be proof against the jar of highway travel. However, it is reasonable to believe that it will be perfected in this respect ere long, and it should then surpass all rivals.

Mechanical Notes.

If your pump fails to work look and see if there is any water in the well. If you have a driven well put it up and ascertain if the strainer is free and in good order.

If a flange union leaks steam, do not attempt to tighten the bolts while the pressure is on them. You may twist one of them off, and this may cause the others to fail.

If you have a flange union to pack, which is exposed to the action of oil, it is well to use some kind of packing that the oil will not dissolve, for it frequently happens that the cost of the packing itself is insignificant compared with the cost of labor required to put the packing in place. Put a small piece of the packing to be used in a cup of the oil, and let it stay there for a week, and if the oil has not affected it during that time it shows that it will resist the action of the oil when in use.

Keep water in your ash pit and it will protect your grate from the heat that might be generated by the falling fire.

The evaporative power of wood is, by weight, pound for pound with coal, about four-tenths of the latter; in other words, wood will do less than half the work that coal does.

When your smokestack gets rust-eaten take it down, or the first windstorm that visits your mill will level it, and in doing so it may do damage amounting to more than the cost of a new stack. It might fall on your employes or your engine.

When fitting up a steam plant provision should always be made for more than one boiler feeder. If only one is furnished, and some trivial accident disables that one, the cost entailed by even a short shutdown will more than cover the cost of a reserve pump or injector.

It is a good idea to be as economical as possible in the use of oil, but it does not pay to attempt to run an engine with an insufficient quantity of cylinder oil, for not only will the cylinder be ruined, but you will use extra oil enough to much more than pay for all the cylinder oil needed.

BORING steam engine cylinders while heated by the steam at full boiler pressure is reported. Measurements indicate that alterations take place in the shape of the cylinders under two extremes of temperature; and cylinders bored while cold are not perfectly true when under steam.

THE Cleveland, O., Rolling Mills Co., ship molten metal by rail from their central blast furnaces to their Newburg mills, five miles away, over the Erie road.

Electrical Progress.

The Possibilities of Electrical Pumping Machinery.*

By Chas. A. Hague.

The pumping of water by means of the power derived from the electric current has, as many are aware, already been accomplished upon a limited scale.

The convenience and controllability of electrical power, together with its simplicity of application to the work of pumping, commends it very strongly for use in isolated places, such as high service systems in public water supply, wherein a comparatively small percentage of the total water supplied by the initial plant is needed for dwellings situated upon levels too high to be accommodated by the general pressure; and the question, of course, arises whether we shall put the entire system of the city under the highest pressure required to force a supply to these higher levels, thereby placing a large portion of the mains and fixtures under an unnecessary strain, while operating under wasteful conditions of pumping power; or whether we shall isolate the higher levels and handle the smaller percentage of water by itself.

The application of electrical energy to the pumping of the main supply of a city of considerable size, although presenting many attractive features as far as the actual operation of the pumps is concerned, is not yet within the possibilities on account of the absence of inexpensive methods for producing the necessary current; so that, apparently, in pumping large quantities for some time to come, the compound, the triple and the quadruple steam pumping engines will hold their sway. To-day it is beginning to offset very forcibly the proposition that it does not pay, in the present state of perfection of the steam engine, to go very far out of the way of regular commerce to get the cheap power afforded by a falling stream.

To bring the problem of high-service pumping down to figures and familiar terms, supposing that a city's total supply is 10,000,000 gallons per day, and only 1,000,000 gallons are needed for a district which would make it necessary to deliver its supply under a pressure of 125 pounds per square inch if delivered from the main pumping station, while the remaining 9,000,000 only needed a pressure of 75 pounds for distribution. Then the difference in power would be as follows: The entire 10,000,000 gallons under the 125 pounds pressure represents 500 H. P., while the 9,000,000 gallons under 75 pounds pressure represents only 270 H. P., and the 1,000,000 gallons under the high-service pressure of 125 pounds represents only 20 H. P. The economy of power then would be 500−(270+20) =210 H. P. saved by dividing the service.

How convenient it would be to generate an electric current at the main pumping station, with the boiler plant used for pumping the main water supply, then run the wires up to a point adapted to the high-service pumpage and operate an electrically driven pump. Of course, a high-service steam pumping plant could be installed at the proper point, but that would mean expensive attendance, hauling of coal, ashes and supplies, and last, although by no means least, large quantities of smoke and dust dispensed broadcast over what is generally a residence district. There are cities wherein pumping plants are supplied with anthracite coal at double the cost of bituminous coal, to quiet the complaints of dwellers and the owners of lawns and trees.

Glance for a moment at the saving in fuel shown by dividing the service as set forth above. The case supposed is extreme, but extremes illustrate forcibly, and there are probably cases in actual practice the full equal of the one supposed. Allowing that an economic duty of 1,000,000,000 gallons is obtained at the pumping station, or, say, two pounds of coal per H. P. hour, then the 210 H. P. saved represents $5475 per annum, which would pay five per cent interest upon $109,500.

Even if it should not be desirable to install an electric generating plant at the main pumping station, power could often be obtained from street railways, or lighting plants already in existence in many cities. When we consider the inconvenience and cost of sometimes providing mains for different districts, simply to convey the water supply from a central high-service pumping station, the possibility of a small electrical station for each district begins to hint at the economy in first cost and maintenance of such an electrical system.

The method of switching on and off the electric current by means of the water-level or pressure is one of the details that will occur to the hydro-electrical engineer. In using the term hydro-electrical engineer, I simply follow the tendency to specialize which has taken strong hold upon modern science and practice. At the start the hydraulic engineer thought that there was nothing to do but harness up the electric dynamo and motor to a pump, and the task was accomplished of pumping by electricity. The electric engineer imagined that there was nothing to do but harness up a pump to his motor, and behold! the result was obtained. But after a few attempts it was discovered that the pump handling such a stubborn and inelastic element as water was subject to inertia, shock, and variable power within short limits, quite at variance with the steady, uniform operation desirable for the best electrical results. The pump man turned his attention to securing a steadier flow of water, while the electrical man was, apparently, inclined to adopt the convenient but wasteful methods involved in the process of wasting power instead of controlling it. Hence the hydro-electric engineer, whose office is to reconcile the extremes of the case into the most benefit to all concerned, precisely in effect as the modern steam pumping engine designer has evolved a machine which, operated by a highly elastic fluid at one end, smoothly delivers an obstinate unyielding fluid at the other.

If the steam pumping engine taking steam from the boiler at a pressure of 150 pounds and sending this steam to the condenser at a pressure eight pounds below the atmosphere, can deliver, without shock and with a fairly close approach to theoretical economy, a steady stream of water, there is every reason to believe that the hydro-electrical engineer will eventually be able to bring the items of short-circuiting, resistances, amperes and volts into a reasonably close approximation to the results demanded.

* Abstract of a paper read before the Atlanta meeting of the American Water Works Association, May 28-30, 1895.

Figures on Mine Working.

In answer to two Plumas county inquiries from mining men, San Francisco firms sent the following figures:

We estimate for you on a plant of sufficient capacity for 200-horse power, delivered as follows:

Two 100-K. W. 3000-volt alternating current three-phase generators, with pulleys and sliding rails; speed, 900 revolutions per minute.

Two 4½-K. W. direct current exciters.

Two panel switch-boards, containing standard regulating and operating instruments.

All f. o. b. cars, Oroville, Cal., and including the cost of erection after the apparatus is delivered from Oroville to Quincy, $5850.

In the matter of wire would say that the size of the wire, consequently the cost, varies with the amount of power to be transmitted and the distance of transmission. Assuming, however, the size of a wire necessary to transmit 200-horse power five miles, which would be of such a size that you could transmit any intermediate distance a branch off from it as you desired, the cost per mile, including wire, pins, insulators and cost of erection, would be $475. This would not include poles, which we presume you could get locally.

Of course, these estimates do not include any step-down transformers or motors. The price of these will vary with the sizes, and little of value could be estimated on these until you had an idea of what size units you would wish to have them operate in. The motors would in all cases be owned by the users of the power. Transformers would be presumably your property and would cost in the neighborhood of $3000, depending on the sizes and kinds.

Two Great Enterprises.

This week the two greatest electrical achievements of the time have been successfully inaugurated—the transmission of electric power from Folsom to the State capital, 22½ miles, and from Niagara Falls to Buffalo, New York. The California enterprise essays the transmission of electric power over a greater distance than any heretofore attempted. The Niagara enterprise, by reason of its great cost, and in the face of $1.50 coal, attracts equal interest. To both projects the scientific and commercial world gives equal attention. San Francisco capital is behind the Folsom-Sacramento project: New York City money has been the mainspring in the Niagara-Buffalo proposition.

A special "Niagara Power Number" of *Cassier's Magazine*, speaking of the station there, says:

The great power installation at Niagara Falls, by which, for the present, about 50,000 horse power is to be utilized, comprises a surface canal, 250 feet in width at its mouth, on the margin of the Niagara river, a mile and a quarter above the falls, extending inwardly 1700 feet, with an average depth of about twelve feet, serving water sufficient for the development of about 100,000 horse power. The solid masonry walls of this canal are pierced at intervals with ten inlets, guarded by gates which permit the delivery of water to the wheel pit in the power-house at the side of the canal. This wheel pit is 178 feet in depth, and is connected by a lateral tunnel with the main tunnel, serving the purpose of a tailrace, 7000 feet in length, with an average hydraulic slope of six feet in 1000, the tunnel having a maximum height of 21 feet and width of 18 feet 10 inches, its net section being 386 square feet. Its slope is such that a chip, thrown into water at the wheel pit, will pass out of the portal in three and one-half minutes, showing the water to have a velocity of 26½ feet per second, or a little less than 20 miles an hour when running at its maximum capacity. Over 1000 men were engaged continuously for more than three years in the construction of this tunnel, which called for the removal of more than 300,000 tons of rock, and the use of more than 16,000,000 bricks for lining. The construction of the canal, and especially of the wheel pit, 178 feet in length, with its surmounting power-house, were works of corresponding difficulty and importance.

Wheels, calculated to yield 5000 horse power each, occupy a position in the wheel pit, 140 feet below the surface, to which water is conducted by a tube, or penstock, leading from the service canal, and discharging between the twin wheel, from which the water falls away into the side tunnel, conducting it to the main tunnel and thus to the lower river. The power, of course, is developed through the drop in the wheel pit, the tunnel serving the purpose only of a tailrace. Three of these wheels have been built, and are now in place. They are about five feet in diameter. The penstock, seven and one-half feet in diameter, is made of steel, and the constant pressure of its column of water, discharging between the twin turbine wheels, serves to support the entire weight of all the revolving parts, namely, the weight of the wheels, the vertical shaft and the revolving parts of the electric generator driven by the wheel.

The mechanical problem to be solved in this case, viz.: How to get 5000 horse power from the point of development at the wheels to the surface, 140 feet above? was considered to be much less difficult than that presented in the case of an Atlantic steamer, where the motive power of the 5000-horse power engine is delivered by a horizontal shaft to the screw at the stern of the vessel, more than 140 feet away, the water wheels at Niagara being our engine, the generator at the surface, our screw and the connecting shaft (adopted in preference to belting or ropes), 140 feet in length, being vertical instead of horizontal. This shaft is of steel, three-fourths of an inch thick, carefully rolled into tube thirty-eight inches in diameter, without any riveted vertical seams; but at several intervals, where journals are needed to steady this vertical shaft on fixed collar bearings, it is solid, and at those points measures eleven inches in diameter.

Each of the water wheels drives a mammoth electric generator of 5000 horse power, and of a form devised by Prof. George Forbes of Loudon, resembling a mushroom or umbrella, in which the stalk or handle is the shaft of the turbine, and the cap is the revolving part of the generator, serving the purpose also of a fly wheel for the turbine. This special advantage resulted from Prof. Forbes' happy idea of a dynamo in which the field magnets should revolve instead of the armature.

A Powerful Projectile.

At Indian Head proving grounds on the Potomac, the Ordance Bureau of the Navy Department is making the first complete test of the most powerful projectile yet contrived for modern naval warfare—the Wheeler-Sterling semi-armor piercing projectile; each of these shells weighs 1000 pounds. The projectiles are thirteen inches in diameter, two feet long, and have a conical head of chrome steel. They are supposed to pierce the toughest nickeled steel armor to a depth of seven inches and then explode. There is no end to the havoc they will cause. One of them successfully shot is supposed to tear the biggest battle ship to pieces. The projectiles carry sixty pounds of highly explosive powder in their heads. The Ordnance Bureau has ordered 400 of these projectiles and two selected at random from each hundred are put to the test. In order to make the shells conform to the requirements of the navy these eight shells must perform successfully the work claimed for them. A charge of 650 pounds of powder is required for each shot. The gun from which they are fired is thirteen inches in inside diameter — the largest bore used on modern battle ships. The test arranged is to be conducted under all the conditions as nearly as possible as they would exist in naval engagements. A ship's side in facsimile of the battle ship Iowa has been built at the navy yard at Norfolk and sheathed with the armor plate to be used on this great battle ship. This has been brought to Indian Head and the eight 1000-pound projectiles will be fired into it from a distance of 2000 yards.

Millions of acres of land are to be added to the great areas of the West. The last Congress enacted a law providing that the general government shall donate to each State in which there are arid lands one million acres of such lands, on condition that the reclamation is done by the States. Already Idaho and Wyoming have complied with all the formalities of the law, and have taken steps towards securing the million acres of land within their borders. California has not yet acted in this important matter.

The iron foundry at Birmingham, England, in which James Watt worked out his idea of the steam engine, has been closed after an existence of 133 years. It at one time employed 4000 men, but only one-tenth as many were on the roll when the doors were closed.

Mining Summary.

CALIFORNIA.

Mariposa.

AROUND COULTERVILLE.—*Gazette:* Water is drying up rapidly but still for many miles around Coulterville prospecting parties and pocket miners are at work. Though the country is a difficult one for a stranger to find his way in, those who know their way about can usually locate a good spring of cold water within a mile or two of any given point.

AT REDBANK.—At Redbank, eight miles up the river from the Horsesboe, large operations are opening up. Ten miners are at work driving two tunnels, and the same number of men are employed above ground. The Redbank owners propose to spend between $300,000 and $400,000 on the development of their property, and are entirely satisfied with their prospects.

Nevada.

THE ROSE HILL.—*Tidings:* The Rose Hill mine's new gasoline engine only costs $3.20 per day for crushing 12 tons of ore. Since starting up they have crushed 150 tons of ore, which gave good results. The cost of the mill screens, plates, buildings, foundations, machinery, including freight, has been less than $2200. Thus, at a profit of only $6 per ton, less than 400 tons will pay for the entire establishment.

SOLD AT SHERIFF'S SALE.—*Transcript:* The sheriff has sold the real property of the Gold Flat Mining Co. to satisfy a judgment for $475.11 in favor of J. Kitts.

THE BELLEFOUNTAIN.—An assay has been made of some of the rock taken out of the Bellefountain mine at Willow Valley, which gave a result of $338.50 per ton.

CANADA HILL.—*Transcript:* At the Mayflower mine, on Canada Hill, the buildings for the new hoisting works and for the new twenty-stamp mill which the company intend putting up are being built. It is expected that the new works will be ready by Sept. 1.

Placer.

THE PIONEER MINE.—The Colfax *Sentinel* reports the probable sale of the Pioneer mine to an Eastern company, recently capitalized at $1,000,000, one-fourth of which was subscribed.

Plumas.

GREEN MOUNTAIN MINE.—*National-Bulletin:* Work at the Green Mountain mine is progressing very favorably. About 35 men are employed in and about the property. Taylor D. McLeod is organizing a very effective force of men. Four headings are now being run and good progress made.

THE TABER DRIFT MINE.—It is expected that Horace Taber will soon reach gravel in his mine in Gibsonville ridge. If he does says the *National-Bulletin*, it will cause the old mining town to boom as in early days, when both people and dollars were plentiful. Not only would the striking of gravel in this mine result in its development on a large scale, but it would cause capital to embark in other big drift-mining enterprises. The Thistle Shaft is working a large force of men and taking out lots of gold. The Taber mine is on the same channel and next above the Thistle Shaft property. Its development into an extensive and rich mine therefore appears to be among the certainties.

San Bernardino.

THE DESERT BONANZA.—*Record:* Boone and Souter returned Thursday from a five weeks' trip to the desert. They visited the McHaney properties, seventy-five miles northeast of Banning, and from what they say the reports regarding these prospects have not been misrepresented in the least. The McHaneys are stockmen and almost stumbled on their properties, they having been passed over for years by experienced prospectors. There are four claims in the group and each shows up gold ore in immense quantities, some of it having the appearance of having been shot in. On one of the claims a tunnel has been run in thirty feet on the ledge. At this point the ledge takes a sudden dip and runs nearly perpendicular. The ledge varies in width from thirty inches to six feet, and through it runs a ten-inch pay streak. From this rich ore has been taken. A five-stamp mill is now being put up six miles from the mine by the Messrs. McHaney, and a number of teams are steadily employed hauling ore. Much of the ore that will be worked has come from the croppings along the ledge, and it is very rich. The McHaneys have already received $10,000 from ore that has been worked at custom mills. Messrs. Boone and Souter say they believe this section of country is destined to become a prominent mining camp, as there is no doubt that fine ledges and immense deposits of ore exist there. The one drawback is water, but wells are now being sunk and it is believed that with depth water will be obtained.

Shasta.

MINES AND CAPITALISTS.—*Democrat:* Mines near Redding are working actively and the times promise activity in Shasta county mines. The new process of reducing rebellious ores of the Eureka Tellurium Mining Company, at their mine on Salt creek, is successful. The company is now running its works every day. This process will revolutionize mining in Shasta county. There are a number of rich ledges that are extensive, but heretofore considered of little value because there was no process in the county by which the gold could be separated from the gangue. This difficulty is now overcome, and these mines are now as valuable as free-milling propositions.

Lane & Hayward have a bond on the Brunswick mine, in the French Gulch district, for $80,000. This property has lain idle for nearly twenty years, but proper development opens a large body of rich ore, and a mill test showed $35 ore and plenty of it. There are a number of other mines in the neighborhood that, with proper development and judicious management, would show equally favorable results. The *Democrat* believes this is the first Shasta county mine purchased by a California company. All of the desirable mines are falling into the hands of either Eastern or European syndicates.

Not long ago a representative of one of the largest California mining companies remarked to the writer that it was a shame that the people of Shasta county allowed a foreign company to get hold of such a fine piece of property as Iron Mountain. The *Democrat* deems it is a shame and a disgrace not only to the people of Shasta county but to the mining capitalists of San Francisco and other mining counties of the State. The Iron Mountain property has been known in the San Francisco market for over ten years, and local capitalists paid no attention to it and asserted with brazen indifference that it was a great big base property without merit. But when thorough mining men from London once visited the mine they saw that it was not only a good investment at $300,000, but that it was one of the largest and most extensive mining properties in the world and they did not hesitate to pay over a quarter of a million for it. To-day Iron Mountain cannot be bought for three million.

The *Democrat* continues: "Capitalists of San Francisco and other localities generally set up a howl about foreigners gobbling up all the best properties in the State. Such is a fact. The Uncle Sam is owned by a London syndicate: the Quartz Hill is owned by a Polish syndicate; the Iron Mountain is owned by a London syndicate; the Washington and Gladstone are owned by Eastern syndicates, and all the desirable mines on Mule mountain and Salt creek are owned by Eastern capitalists. All the valuable gravel mines in northwestern Shasta and in Trinity county are being gobbled up by French companies. Whose fault is it? Our own capitalists. California capitalists will have to learn that mines in Shasta county have a value, and if they wish to own the mines they will have to pay something near what the mines are worth. If they don't do this, there are hundreds of men of unlimited capital in the Eastern States and Europe who will be glad to pay fair prices for Shasta county mines."

THE NEW BRUNSWICK.—*Free Press:* The New Brunswick mine, located near the old Tom Green mine, near French Gulch, has been bonded by Captain C. N. Tozier, C. D. Lane and D. B. Hunt for the sum of $40,000. They will develop the property. Cochran & Rossi, the owners, will be allowed to work out their present level, while the bond holders will run lower levels to determine the depth of the ledge. The owners have made considerable money and will yet have a chance to make $1400 or $1500 out of their surface workings.

BONDED THE PROPERTY.—Thomas James of Virginia City and Joseph and Edwin Carpenter of Sacramento have bonded the mining property of Mr. Bughee, near Iron mountain, including the Little Nellie mine. Joseph Carpenter departed for San Francisco Tuesday to make arrangements for the erection of a chlorination plant on the Little Nellie.

Sierra.

Messenger: C. J. York partially cleaned up last Saturday, after a run of twenty-three days with an arrastra, on ore from his mine situated in Sing canyon, less than a mile from Downieville. The output was $625 from forty-six tons of rock; and as he estimates $75 left in the arrastra, the quartz pays over $15 per ton. This ledge was discovered about two months ago, and bids fair to become a valuable property. A drift fifty feet in length has been run on the ledge, which averages four and one-half feet wide. Cuts have been run along the line of the ledge for a distance of 150 feet, and wherever uncovered, the quartz prospects well. This body of ore lies between walls of serpentine and porphyry. If some of the mine owners in this vicinity, who have been "holding on" to valuable ledges for years without endeavoring to develop the same, would emulate Mr. York in his enterprising efforts to open up his property, this part of the county would enter upon a new era of prosperity. Mines would be sold, mills erected, and capital would seek investment in our gold fields.

Siskiyou.

AROUND YREKA.—*Journal:* The gold realized from the crushing of Williams & Wildman's quartz at Lamb's mill in Yreka, hauled from Greenhorn, brought $18.21 per ounce. Thirty-four tons crushed averaged $33 to the ton. A large quantity of tailings and sulphurets are saved, to be worked later, when concentrators are procured to save the fine gold.

Work is progressing at the Espey Hunter & Co. mines. The pumping machinery is not yet ready. The flume from the top of the hill above the electric light works at Shasta river is completed to the claims, but work cannot be commenced until it is supplied with water from the river by the pumping machinery.

NEVADA.

STOREY COUNTY.

THE BRUNSWICK LODE.—The Brunswick lode is traceable on the surface for a distance of 14,000 to 15,000 feet, the surface indications comparing favorably with those that were found in the croppings of the Comstock lode. At several points the Occidental, St. John and Monte Cristo mines have yielded well. On account of water no mining at depth has been done except at the Occidental, and owing to the amount of water encountered at the Monte Cristo vertical explorations have not been extended below 150 feet.

On the Comstock lode the majority of the bonanzas were encountered between the 1300 level and the surface, and it is at the depth of 1300 feet that the great Comstock tunnel taps the Brunswick vein.

On the St. John mine the vertical depth of the Sutro tunnel below the surface is 1344 feet; it cuts the vein at a depth of 1900 feet (on the slope of 45 degrees) below the croppings. In the nearly 2000 feet of vein lying above the level of the tunnel there is valuable ground to prospect by upraises from the tunnel south along the foot wall.

That paying ore does not appear in the vein at a certain point on the level is no indication that there is not paying ore some place above. There is a beginning and an end—a top and bottom—to all things, and under and above the best bonanzas ever discovered is found to be barren ground. The lode where passed through by the tunnel was 113 feet wide; where cut through by the crosscut made from the Zadig tunnel southerly toward the Occidental tunnel is 130 feet in width.

The vein is composed of the same materials as the Comstock—quartz, clay and porphyry—is well defined and carries the Comstock characteristic clay on the footwall.

ON THE COMSTOCK.—The Chollar mine last week extracted and sent to the Nevada mill 15 tons of ore, the average battery sample of which was $33.56 per ton, and shipped 152 pounds of bullion, the par value of which was $3579.74. They have started a south drift from the raise above west crosscut No. 2, 450 level, which is out 16 feet in quartz, assaying from $25 to $30 per ton.

In the Con. Cal. & Va., along the west wall of the eighth floor, continue to find some timbers of old workings, in which are fillings of ore, which it will pay to save. From the second floor up to the eighth floor of this level have extracted 86 tons of ore, the average assay value of which per minecar sample was $36.46 per ton. The Morgan mill will commence running again about the 5th of July.

ESMERALDA COUNTY.

In the Silver Star district a few of the leasers are taking out ore, but most of them are waiting to see what the new company intends to do. The owners of the Gem and Lone Pine are taking out rich ore and developing their mines. The Oneida and Juniper are yielding the usual amount of rich ore. They are making an upraise in the Bounce to get air, when the drift on the ledge will be run ahead to tap the ore body at the bottom of the west winze. These mines are all outside of the ones lately sold, and are all improving as work goes on. Work at Silver Peak is being pushed, and the mill will start next week.

OREGON.

JOSEPHINE COUNTY.

GENERAL NOTES.—Mining is the only business that brings in any money at Grants Pass. Prospectors are numerous. Several small strikes in pockets are reported.

The Griffin ledge, on summit of Siskiyou mountain, which crosses the State line into California at head of Althouse, is being developed by G. C. Weston.

Simmons & Co., at Waldo, are pushing work with their three giants night and day. Their race is over two miles long, very flat, and requires the whole of the east fork of Illinois river waters to wash with. This claim is free from boulders, being a surface shedding from the hill, and is a deposit of fine clay. Their bedrock is a boulder formation, caused by the washing of these hillsides of the Pacific ocean for ages past. This formation is packed so solid that it makes a fine bottom for a mine race and holds quicksilver to catch the fine gold, as all the gold in this mine is very fine.

BAKER COUNTY.

THE BAISLEY-ELKHORN.—The Baisley-Elkhorn mine was sold at auction last week in Baker City to R. S. Cates, agent for R. O. Deming of Kansas City, for $31,000. He gave the sheriff a draft for the amount and entered at once into possession of the property. Some $8000 in claims still stand against the mine for labor and materials.

WASHINGTON.

METHOW DISTRICT.

Messrs. Saheau and Kinney, who have been in the Methow mining district for several months, say a condition of affairs prevails in that district which the new mining laws will regulate to a considerable degree. Poor prospectors who happened in early in the season located twenty-five or thirty claims promiscuously, wherever there was even an indication of metal, and in that manner the greater portion of Okanogan county is located. No work has been done on most of them. The evil lies in the fact that new-comers are always steered up against these worthless claims with a view of making a sale and in that way the visitor gets a bad impression of the country and mines, and also from the fact that everything in sight is located and no development work done of any consequence. One man was mentioned in particular who had located over forty claims since spring and was at present cutting cordwood for the steamboat at $1 a day, trying to raise a grubstake. It is also asserted that mere prospects, with scarcely any development whatever, are held for such high figures that it is almost impossible to get capital to take chances on such a large sum on a prospect, and thus development is held back.

BRITISH COLUMBIA.

GOOD CLAIMS AND WILDCATS.—Frank J. Parker, of Walla Walla, has been inspecting the Trail creek mines. His view of the mines is that of all other experienced miners—that there are good properties there. Hundreds of claims have been recorded, in his opinion far too many.

"The whole country," he says, "is literally seamed with iron ore, and as this was the cropping on the War Eagle, Le Roi, Josie and other ore shipping mines, the general idea is that underneath every seam of iron ore is an equally valuable mine. But the owners in the great majority of cases fear to do any work whatever upon these iron seams and ask thousands of dollars for their interest without having performed more work than an old ben could scratch out in five minutes. Yet every such claim is supposed to be a mine, and there are twenty grafters after each one to unload upon some credulous man with more money than brains. Men owning such claims by the score are walking around with their hands uncalloused waiting for a victim. All the shipping mines so far are situated in one section, on Red mountain, except the North Star, which commenced shipping this week, and the owners are anxiously awaiting returns.

"The whole country is staked out, as the iron seams mean 'mineral in place,' and are so recorded. The mining laws are excellent, the only weak point being that they do not require the boundaries of claims to be properly defined. Many claims are recorded which have no place on the map, so I would advise all who think of investing to go very slow until they are assured the title is perfect. It was on this account I did not bond a prospect I thought likely to be good, for there is no great satisfaction after paying for a claim and spending a thousand dollars or so on it to find it belongs to some one else."

AT QUESNELLE FORKS.—The company in charge of J. B. Hobson, formerly of Placer county, is finishing the canal on which 550 men are at work, 300 Chinamen and 250 white men. The latter receive $2.50 a day and pay $1 a day board; the Chinese get $1.75 and board themselves. It is estimated that the canal will carry 5000 miners inches of water and will be finished by Sept. 1.

A BIG TUNNEL.—The War Eagle Company has ordered a 20-drill compressor, and as soon as the plant is on the ground the longest and largest tunnel ever driven in Kootenay will be started. It will be begun on Center Star creek, and will traverse nearly the whole length of the Iron Mask ground. Thirteen hundred feet will have to be driven before the War Eagle ore chute is struck. This will be the main working tunnel of the War Eagle mine. It will give a depth of 450 feet, and from that down the mine will have to be worked by sinking.

IDAHO.

THE FRISCO MINE.—Wallace *Miner:* There are about 100 men at work on the Frisco and seventy of these have been discharged, leaving thirty men, or thereabouts, at work. Of these only ten men are employed in the mines in addition to a few shovelers. The remainder are working on the surface getting ready for the new hoist and air compressor. All the work at present in progress in the mine is drifting on the lower level and raising from the same. They are grading and otherwise preparing for the large air compressor plant, which has been ordered, but is not expected here about two months yet. Manager McDonald states that it is very indefinite when they will resume full operations again.

THE POORMAN.—*Avalanche:* At the Poorman a new mill is being built.

THE TRADE DOLLAR.—A contract to extend the Caroline tunnel 100 feet has recently been awarded.

THE FLINT.—The Flint Company has resumed operation at their mines after an idleness of several years.

A DESERTED VILLAGE.—Coeur d'Alene *Miner:* Nothing could be more desolate or disconsolate than Mullan now appears. It is safe to say that three-fourths of the buildings are empty. Many of these buildings cost their owners thousands of dollars, and in the majority of cases twenty per cent could not be realized on the investments. The reason for this is well known to all residents of the Coeur d'Alenes. It is almost needless to say that the people of Mullan, the few who are left, are very weary of this condition. They know that their prettily located little town is surrounded by mines capable of supporting a large population in comfort, if permitted to operate.

MONTANA.

THE BENTON GROUP.—The Neihart *Herald* says that seventeen men are employed at the Benton group of mines in that county, and that some good ore is being taken out. The owners of this property have worked it steadily for more than four years, generally employing forty to fifty men. They have expended in that time about $240,000 in development work, which the mine has paid in shipments of its ore. The fact of its continuous run during the hard times is remarkable for a silver property, but the owners have not yet realized anything from their investment.

THE KATIE MINE.—The men at the Katie mine, Basin, have received their pay in full for the time which they were behind. Over $130,000 has been paid out, and all the miners are now paid up to May 1st. A contract has been let and the first consignment of machinery received to double the capacity of the mine.

A WILD KITTEN.—Phillipsburg *Mail:* The issue of the Tacoma *News* of the 21st ult. contains an immense advertisement descriptive of a mammoth gold mine said to be located twelve miles northeast from Phillipsburg, on the line of the Phillipsburg branch of the Northern Pacific. The vein is said to be 16 to 20 feet between walls traceable the full length of the property—4500 feet. The advertisement gives assurance that extensive buildings and machinery will be put on the ground very soon for handling 40 tons of ore each day at a gross profit of $12,000 a month. Continuing, the advertiser states that in order to mine and place on the dump several thousand tons of ore ready to be milled, a limited amount of stock will be sold at ten cents per share. The price is subject to advance without notice, as each week's work pay ore adds value to the mine and price of stock will advance accordingly. For particulars the reader is requested to address L. A. Loomis, 215 Washington building. The exist-

ence in Granite county of such a mine as the Gold Coin Co. describes will be news to its residents. It would seem that a property with such riches right here at home would be known among the mining men of this county, but we fail to find a single individual who ever heard tell of it before. It would appear that the Gold Coin Company ought to establish their identity at the home of their mine before a stampede from Tacoma to the rich discoveries takes place. Such mining enterprises as the above are the greatest drawback to the legitimate industry, and the *Mail* would advise the good people of Tacoma to thoroughly investigate the reliability of the company before making investments with them.

NEW COMPANIES.—The following are new Montana incorporations:

The Bell Group Consolidated Mining Company to work a property near Townsend.

British-American Mining Company, Butte and Trail Creek, B. C.; capital stock, $500,000; to carry on general mining and townsite business, West Kootenai mining district, B. C., to continue for forty years.

Oriental Gold Mining Company, Butte and Basin; $500,000.

High Ore Development Company, Basin; $250,000.

Sixteen to One Mining and Milling Company, Bozeman; $1,000,000.

Castle Mining Company, Great Falls, $200,000.

Montana Antimony Mining and Smelting Company, Thompson Falls; $200,000.

UTAH.

NEAR MILFORD.—*Herald:* The Montreal Mining and Smelting Company operating in the neighborhood of Milford will let a contract for 300 feet tunnel work. It is thought that the Montreal people have a second Annconda in the possession of their southern properties. The copper is running up as the development progresses, until now 38 per cent is a common assay.

GENERAL NOTES.—Captain De Lamar is pushing operations on the Golden Gate group, recently purchased by him, in the Camp Floyd district. A new steam hoist has just been completed.

The Ibex smelter, at Leamington, now in the hands of a receiver, was blown in last week, and the plant will be operated to pay off the claims against the company.

Two gold bars were sent in by the Mercur Company during the week. Their value was $15,518, making the production for the month over $50,000. The Mercur Company has added to its cyanide plant a converter by which the cyanides are reduced to bullion.

After an idleness of several weeks the Commercial mill at Bingham has resumed operations, the claims against the company having been settled and the attachments released.

During June the Ontario and Daly mines, operated by the same management, have produced 114,000 ounces of silver.

WYOMING.

A REPORTED DISCOVERY.—Gold is reported discovered twelve miles from Douglas. Over 100 claims are staked out to-day.

COLORADO.

DIFFERENT MILLS AND PROCESSES.—*Review:* The following is a fairly complete list of the different mills and processes in operation in Cripple Creek district.

Crawford mill, electro-cyanide process.

Gold & Globe mill, amalgamation and chlorination.

Brodie mill, cyanide.

Gold Geyser mill, Anaconda, amalgamation.

Hartzell mill, Anaconda, amalgamation.

Lawrence mill, Wilson Creek, chlorination.

Beaver Park mill, Beaver Park, amalgamation.

Colorado Springs mill, Beaver Park, amalgamation.

Denver mill, Beaver Park, amalgamation.

Summit mill, Beaver Park, amalgamation.

Gillette mill, chlorination.

United States Economic Reduction company, bromination.

Florence mill, cyanide.

TWO PROPERTIES CLOSED.—The West End mill and Black Wonder mine, a dual concern operated by the Black Wonder Gold and Silver Mining Company of Boston, have closed down. The properties are situated at Sherman, Hinsdale county, near Lake City, and Sherman now presents a spectacle not uncommon in the West—that of a thriving mining town which has been completely deserted.

The stated cause is that the mine could not produce enough ore to keep the mill running, but the most generally accepted theory is that the Boston syndicate backing both refused longer to advance money, over $100,000 having been sunk in the properties. H. Stearns, one of the Boston directors, was in Lake City last week, and it was after an examination by him that the order to close was given. The indebtedness of $13,000 is said to have been paid.

WHOLESALE THIEVERY.—Discovery of the thefts of rich ore from the Golden Fleece mine has led to the belief that ore worth millions of dollars has been stolen from the mines of Colorado in the last ten years by an organized hand. The robberies have not been committed by the miners, who are generally honest men. So far there is no clue to the leaders, but it is believed that with detective work and the spending of much money the thieves may be caught. The loss sustained by the Fleece is placed at $70,000, or more than the actual dividends of the mine. The Fleece has paid the June dividend, but ordered a suspension of all work on the mine until responsibility for the stealing is placed. At a meeting of miners at Lake City considerable feeling was developed over the statements of the directors that the employes were responsible for the loss. The union adopted resolutions deprecating the action of the company in branding as thieves former employes. The meeting adjourned until such time as Manager W. A. Aikers could be present, when efforts will be made by the conservative element to heal the breach that has been opened by the company. One dwelling was searched, on suspicion that the occupants were implicated. No evidence was found. It will be impossible for the victims to recover anything from the stolen ore, which is supposed to have been forwarded to an Eastern smelter for reduction. Among other mines that are said to have suffered from the smugglers are the Della S., Mollie Gibson and Argentum Juniata of Aspen, the Victor and Pike's Peak of Cripple Creek. The method of stealing is simple: From blocks of ore corners are knocked off and carried away in the pocket. Hereafter those mines will be handled more after the manner of the diamond mines. The leading mine owners have organized for protection, which may be obtained through the smelters and ore buyers, who can detect the stolen ores when offered for sale. The stolen ore has not been marketed in Colorado. This indicates that the thieves are possessed of money and are capable of getting their ores out of the camps by some underground road, so as to avoid the possibility of detection by the railroad detectives, who are constantly on the alert for such cases. The Victor mine has discovered that its richest ore was being stolen by some means that defied all attempts to trace. Returns on the surface did not agree with the reports from the underground works, and the investigation showed that lots of the rich ore was not coming to the surface on account of the company. Search failed to reveal the ore in the shafts and tunnels, and the inference was that it had been taken out in a surreptitious manner during the night, or at hours when darkness would allow the thieves to remove the ore in small lots without attracting attention. There was but one remedy for the evil, and that was adopted by the manager. Every employe of the Victor was discharged, and the new crew placed under surveillance.

AN INTERESTING EXPERIMENT.—Georgetown *Courier:* Prof. Richard Pearce of the Boston and Colorado smelting works, recounts the following interesting experiment at Argo. He took a crushed sample of rich ore from Cripple Creek, which carries 1100 ounces of gold per ton, and digested it in a very weak solution of sodium chloride and sulphate of iron, making the solution correspond as near as practicable to the waters found in nature. The ore was kept in a place having a temperature little less than boiling water for six weeks, when all the gold except one ounce per ton was found to have gone into solution. A few small crystals of pyrite was then placed in the bottle of solution and the gold began to immediately precipitate on them. It was noticeable, however, that the pyrite crystals which were not free from zinc, galena and other extraneous matter, received no gold precipitate. Those which had no such foreign associations were beautifully covered with fine gold crystals.

TWO NEW COMPANIES.—The Big Johnny Gold Mining Company and the Keystone Belt Mining Company have incorporated in Denver to operate in the Western pass near Leadville, both for 1,000,000 shares. The organizers are old prospectors and have spent several years exploring the country in and around the Western pass. Considerable development has been done on the Big Johnny property. The Keystone property will also be opened up and pushed to the contact.

THE FLORENCE CYANIDE WORKS.—The Metallic Extraction Company (the Moffat-Smith Cyanide Works) has shipped 750 ounces of gold, the result of a two-weeks' run on Cripple Creek low-grade ores. The works are running twenty-four hours a day every day in the week. Foundations are being constructed for two additional crushers. The owners of the plant are reported so well pleased that they will shortly begin work on another plant equally as large as the present one.

BUSY PROSPECTORS.—There are probably 1000 prospectors now in Green Mountain district, and new finds are daily being made.

A FLOODED GOLD MINE.—A Leadville dispatch says the Rex mine was drowned out last Monday and there is now over 250 feet of water in the shaft. All the workmen made their escape. The ore, believed to be very rich in gold, was just being entered when the mine was flooded. It is likely that a mammoth pumping plant will be put in and the shaft drained at once.

SILVER AT HAHN'S PEAK.— Steamboat Springs, Colo., reports considerable interest in the neighborhood of Hahn's Peak over the discovery of a blowout of silver-bearing rock, said to come from the blanket vein. The ore is said to run several hundred ounces of silver to the ton. There are already 400 or 500 men on the ground and hundreds of claims have been staked.

INDIAN TERRITORY.

The many sensational stories of a wild gold excitement in the territory are all untrue. The gold field at present consists of a large area of country covered with claim stakes and there are a few poor farmers washing sand in home-made sluices. There is probably gold in the sand underlying Boggy creek country, but it will take several assays to determine whether it is worth taking out. It will take experienced prospectors to determine where the sand is and lots of money to collect the gold from the sand. The country may develop a gold field in time, but at present there is nothing to get excited over.

Assays of several samples of sand taken out at various points show gold possibly in paying quantities, but if it is there in sufficient quantities money will be required to put in machinery and condensers. The only way to work the sand will be on tables like quartz tailings are worked. The stories of thousands of people being in the diggings are pure fabrications. But comparatively few men are there, and several so-called camps, and many of them are so poor that they barely exist. The stories of Oklahoma towns being depopulated and thousands rushing to the diggings have been originated by men interested in drawing outsiders with money into the territory. The Boggy creek country is a good one to stay away from, but experienced mining men with money may find something there to interest them.

NEW MEXICO.

GENERAL NOTES.—Silver City *Enterprise:* At the Van smelter copper matte is being produced at the rate of two tons per day. The company have an assurance of an abundant supply. Bell & Stephens are shipping eight tons of ore per day and seven tons of concentrates. The ore will run about two ounces per ton in gold and carries a good percentage of copper. The concentrates made from the tailings of the Bell & Stephens mill will run nearly as high as the raw ore which is shipped.

The Texas mine has been shut down temporarily, to adjust differences between owners.

The Ivanhoe smelter is compelled to suspend operations on account of scarcity of water. Every indication points to an early rainy season, a few showers have fallen already.

Galloway & Alexander shipped a four-ton sample of ore to the Davis mill at Gold Hill for reduction. The ore is said to have run $38 per ton in gold, on the plates, and the tailings to have assayed $17.00 per ton.

FOUND AGAIN.—The Adams Diggings have been found again, but this time they are located at the head of the Animas in Sierra county. The discoverer is said to have taken $10,000 in gold to Las Cruces. He then went crazy and died.

ARIZONA.

GLOBE ON THE VERGE OF A BOOM.—H. D. Underwood tells the Arizona *Silver Belt* that Globe is on the edge of a great mining boom. The big Buffalo mines under the management of Dr. E. H. Cook are being put in readiness and work with a large force of men will be shortly begun.

The Old Dominion in the hands of its new proprietors is also shaping itself for action.

In the belief of Mr. Underwood 700 men will be at work within the next sixty days.

The Bowie and Globe railroad has been completed as far as Fort Thomas and as soon as it has been definitely settled when work in the Globe mines will be resumed the railroad will be pushed.

GENERAL NOTES. — *Journal-Miner:* The Crowned King mill is running day and night. Fifty men are at work.

The Rapid Transit, near Crowned King, owned by Henkle & Mitchell, is being worked; fifteen miners employed. The ore samples $50 in gold and 50 ounces in silver.

There are fifty men placer mining within a distance of fifteen miles on the Upper Hassayampa, some working new ground, many handling ground that has been worked before, and a part at least are making big wages from their work.

The Nellie mine, near Crook Canyon, has been sold to E. E. Kenedy of Denver, the price paid being $2000. It is a free-gold property worked years ago.

Mark Murphy, superintendent of the Peck, is preparing to place a pumping plant on that property to drain the mine. The old workings are being drilled into near the surface. Mr. Murphy says the footwalls in the upper level were never reached in the early workings, and the result is thousands of dollars in horn silver ore has been found.

Placer mining is going on everywhere around this section. Where water is not to be had the dry machine is substituted, and in some dry gulches the gold-pan miner handles the dirt in such a manner that excites admiration over the novel method men have of working when necessity pushes them to it. "Dry panning" is adopted in but few instances, and some miners have become quite expert in such work.

Unauthenticated reports say that rich ore has been run onto in the old Senator mine, the strike taking place in the deepest workings. As to the extent of the vein or its value nothing is known other than that samples of ore indicate at least $300 per ton, being of a sulphate character.

DOS CABEZAS.—*Prospector:* The mines at Dos Cabezas continue to produce steadily, and the shipments of bullion from that camp are made occasionally. There has been a good deal of development work done in camp within the past few months, and it is expected that the list of productive mines will be increased considerably before the end of the year.

IN THE HUACHUCAS.—The rich strike recently made at the Copper Glance mine in the Huachucas attracts attention. Some of the ore that is being taken out is rich enough to ship without concentration. The ore is a well-defined streak of black color thirty inches wide.

MEXICO.

GOVERNMENTAL MINT CONTROL RESUMED.—Under the new law which went into effect last Monday the Government of Mexico resumes control of the mints, and will levy a uniform tax of five per cent on all gold and silver contained in the ore mined in the country, without regard to where it is smelted. For several years the mints have been leased to private individuals, who, while they have charged a mintage tax, have put it on a somewhat different basis from that proposed by the Government. The charge for minting gold and silver has been almost 4½ per cent, while the Government has collected in addition .61 of 1 per cent, making a tax of over 5 per cent to be paid by all Mexican mine owners having their ores coined into money in Mexico, while those who sent their product to smelters either in the United States or Mexico escaped this tax. It was this condition of affairs that induced the Government to assume control of the mints and to tax all ore, irrespective of where it is treated.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 25, 1895.

541,536.—HOSE COUPLING—W. Curlett, S. F.

541,725.—BRICK MACHINE—W. E. Damon, Pomona, Cal.

541,559.—STEAM GENERATOR—A. Heberer, Alameda Cal.

541,624.—TUNING PIN—H. Muller, S. F.

541,486.—CAR COUPLING—J. C. Parrott, Pullman, Wash.

541,780.—ELEVATOR—S. M. Philbrick, Portland, Ogn.

541,500.—ELECTRIC CONTROLLER—O. H. & A. F. Pieper, San Jose, Cal.

541,681.—SUSPENDERS—H. Pulz, S. F.

541,792.—SAFETY PIN—J. Schary, S. F.

541,540.—ROLL PAPER PRINTER—Sullivan & Mathews, Seattle, Wash.

24,432.—BADGE DESIGN—W. N. Brunt, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONDUIT ELECTRIC RAILWAY SYSTEM.—Charles M. Allen, S. F. No. 540,569. Dated June 4, 1895. This invention relates to a novel means for transmitting the current from the main conductor to the moving car by means of a series of successive contacts which are made as the car passes, and are broken immediately after. In carrying this out, an underground conduit is employed having a slot made in the side of the upper part, a contact bar extends downwardly from the car through this slot having conductors passing through arms from the contact bar to connect with the motor machinery of the car, contact boxes fixed at intervals within the upper part of the tube or tunnel and near the line of travel of the contact bar of the car, interior insulated boxes with stationary plates, clamps extending from the main conductor through one side of each of the boxes connected with stationary contact plates so that the latter are connected directly with the main conductor, and movable contact plates, the shanks of which extend outwardly through another side of the box with rollers upon their outer ends with which the contact bar of the car impinges as it passes so as to force the interior plates into contact with each other. These plates are separated by a spring as soon as the bar has passed.

FINGER-RING TWINE CUTTER.—James Wallace, Oakland, Cal. No. 540,930. Dated June 11, 1895. This invention relates to a device for cutting twine. It consists of a ring adapted to fit the finger, having its rear side extended to form a broad bearing; an arched blade extending approximately parallel with the ring axis, provided with projections by which it is secured so that the point projects slightly over the front edge of the ring, and the inner edge of this knife is sharpened so that any thread or twine to be cut can be easily passed beneath the point and drawn across the cutting edge. This device is very suitable for salesmen, as it can be worn upon the finger and in such position as to be in readiness to cut twine after packages have been done up.

FAUCET.—A. H. & T. A. Schleuter, Oakland, Cal. No. 540,844. Dated June 11, 1895. The object of this invention is to provide a faucet which is especially applicable to oil cans, so that by the use of the faucet a lamp or other receptacle may be filled directly from the faucet, and will not overflow while filling, the structure of the faucet being of such a nature that after the filling, the faucet closed and the lamp removed, there will be no leak or drip from the faucet. It consists of a closed chamber having a flat seat with segmental openings upon opposite sides, one of which connects through a passage with the interior of the vessel to which the faucet is attached, the other one connecting with the discharge spout. A valve is adapted to close both of said openings simultaneously by turning the screw stem thereof, and in conjunction with this is an air channel, formed in the side of the screw stem, which admits air into the valve chamber when the valve is closed and which is cut off therefrom when the valve is opened. Another air passage extends from the interior of the valve chamber alongside the discharge spout to near its lower end. A second spout extends from the opposite side of the valve chamber into the can and thence to the top projecting above the surface of the liquid. A lug projects from the bottom of the valve face corresponding with the inlet opening in the seat, and this lug enters the opening when the valve is closed and is withdrawn therefrom when the discharge opening has been fully exposed to the rising of the valve.

ADJUSTABLE BUTTER MOLD.—Herbert S. Malthy, Clarksville, Cal. No. 540,839. Dated June 11, 1895. This invention relates to that class of butter molds in which provision is made by the use of a filling strip between the meeting edges of the mold sections for following the capacity of the mold to compensate for changes in temperature and shrinkage, thus adapting the mold for the production of molds or squares of given weight under any circumstances. The invention consists in a butter mold, between the meeting edges of both the back and front of which are seated filling strips, and also in a mold having in addition to said filling strips the back edges of its sections adjustably connected by its hinges, whereby the mold may be additionally varied in capacity and inaccuracies attendant upon such increased capacity corrected.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law, Mining Patents and matters before the Land Department a Specialty. Crocker Building, Rooms 201, 202 and 203, San Francisco.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor. Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco. Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.
Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

EDWARD S. COBB,
Mechanical Engineer and Expert.
Tests and Estimates for the Improvement of Pumping, Power and Hydraulic Plants.
Will supervise the Construction, Shipment or Erection of Machinery. Will make Drawings, Estimates or Specifications.
Prices obtained for machinery of every description. Twenty year's experience.
109 California St., Rms 30 & 31, S. F., Cal.

GILES OTIS PEARCE,
Mineralogist and Metallurgist.
708 Colorado Avenue, Colorado City, Colo.
Will examine Mines, Ore Bodies, Mineral Belts or Zones, and make written Mineralist Reports, fees for which made known upon application for services. I make my own assays and select my own samples when examing mines. Eighteen years' experience. Analysis of water and soils.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Solls, Waters, Industrial Products, Foods, Medicines, etc., etc. Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

Almarin B. Paul, M. E.,
Mining Operator,
ROOM 58, CROCKER BUILDING,
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the Investment of CAPITAL in RELIABLE Mining Enterprises, also will give attention to the sale of, and reporting on RELIABLE Mining Properties, or the procuring of suitable Machinery for Interest in Developed Mines.

Nevada Metallurgical Works,
No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.
C. A. Luckhardt & Co.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.
Dr. Willis E. Everette,
1141 R. R. Ave.
Tacoma, State of Washington, U. S. A.

WADE & WADE,
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold, erection and regulating of Frue vanners. Address, 132 Market St., Room 15, San Francisco, Cal.

GOLD. SILVER.
Chas. F. Blackburn, E. M.,
—AND—
PRACTICAL MINING GEOLOGIST,
Weaverville, Trinity Co., Cal.
GOLD MINES OF ANY DESCRIPTION.
Specialty—Free milling quartz gold todes and large bodies of hydraulic placer gold deposits. Prices low and easy terms. Big profits sure, as I handle none but dividend-payers and am careful in the selection of good properties only. Will examine and report on mines in this region or elsewhere. More than 20 years' mining and geological experience. Terms low.
METAL. MINERAL.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.
Gold and Silver Refinery
—AND—
Assay Office.
HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.
Manufaoturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
Also Manufacturers of
STANDARD SHOT-GUN CARTRIDGES,
Under Chamberlin Patent.

ALBERT MALTMAN, Practical Metallurgist and Engineer.
SAMUEL C. THOMPSON, A. B. Yale University. E. M. Columbia University.
Maltman & Thompson,
MINING ENGINEERS AND METALLURGISTS,
Owners of Nevada County Reduction Works,
Address: Grass Valley, Nevada County, California.
Inspect and report upon Mineral Properties, Treat Refractory Gold Ores and Concentrates by Chlorination. Furnish Plans for and Superintend Erection of Chlorination Plants, General Analyses of Ores.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XXX.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894, by Henry G. Hanks, F. G. S.

Thousands of individuals may enjoy the comfort, convenience and cheapness of natural gas in California for domestic purposes.

The water flowing with the gas from these wells, having an unpleasant saline taste, is not used except for bathing purposes, for which it is admirably suited. The temperature, as it flows from the wells, is quite uniformly 89° Fahr. It is really a mineral water, and sometimes may be found valuable as such. The flowing water leaves a yellow sediment of sesqui-oxide of iron and a trace of petroleum on its surface. My analysis of the water from the "Citizens' well" gave the following result: Specific gravity, 1.003; total solid grains in gallon 319.28; equivalent to parts in 100,000, 547.50.

The taste was saline; reaction slightly alkaline. On standing, a sediment fell which consisted of sesqui-oxide of iron and a little very fine sand. When evaporated to dryness common salt crystallized out, and the chlorine present was equivalent to 292.8 grains of salt in one U. S. wine gallon, but there was no proof that all the chlorine was so combined. The bases found were iron, lime, magnesia, silica sodium and a little organic matter. The acids were sulphuric, phosphoric, carbonic and chlorine

In one of the bathing establishments of the city the water is changed once in twenty-four hours. When the tank is refilled an iridescent scum floats on the surface. This is removed by drawing a floating scantling from one end of the tank to the other. An examination of this scum shows it to be composed of sesqui-oxide of iron and petroleum. The quantity is small. No gas well in Stockton ever produced more than traces of petroleum.

It is a question in my mind if the water is the active agent which, rising on the theoretical artesian principle brings up the gas mechanically to the surface; or if, on the contrary, the expansive force of the gas increased by pressure is not sufficient to lift the water. I am inclined to the latter opinion. That all the Stockton wells overflow and do not spout, and that no gas comes from any well that does not overflow, confirms me in this opinion.

As it is generally admitted that the Pennsylvania and Baku eruptive petroleum wells owe their energy to gas pressure, it is fair to assume that the same agent performs a similar labor in a less energetic manner in California—less energetic only because the quantity and pressure are less.

The drilling of the gas wells in Stockton is exactly similar to drilling for petroleum and artesian water. Boring is an operation quite different. One variety is called "hydraulic well sinking." Instead of solid iron stems for the tools, wrought iron pipes 2 to 3 inches in diameter are substituted. These are screwed together in lengths joined by sockets, as common gas or water pipes are joined. These sectional pipes connect with a bitt or cutter, driven by machinery making 40 revolutions per minute. A stream of water is forced by powerful steam pumps down through the tubes to the bottom of the well, which rising in the bore hole brings up most of the debris made by the tool. After a time it becomes necessary to remove the tools and use the sand pump in the usual manner, thus clearing the bore hole of coarser fragments which the force of water was not powerful enough to eject. This operation is continued until the required depth is attained.

I have been informed that some years before gas was discovered in Stockton, a well was sunk on Union Island 15 miles below that city, which at a depth of 1500 feet, began to flow mineral water, accompanied by inflammable gas, but the object being good water, no attention was paid to the gas.

That natural gas rises with artesian water in the city of Stockton is no new discovery, for as early as 1858 a well was drilled near the court house which delivered water foaming with gas. This excited but little interest at the time, but was mentioned in the papers as a curiosity, and was occasionally referred to as such until 1883, when a well sunk one mile south of the city by J. D. McDonald produced the same mechanical mixture of gas and water. When the well had reached a depth of 975 feet it was proved by experiment that 15,000 cubic feet of gas came up daily with the water. This quantity of gas would fill a cubic space with sides 25 feet square. Mr. McDonald has continued to use natural gas in his family ever since. This was the first use of gas in Stockton, if not in the State.

About the same date (1883) the Stockton Water Company, seeking water in the eastern part of the city, found gas, which was immediately set to work giving light and heat. These successful ventures gave confidence to capitalists, and other wells were undertaken.

(To be continued.)

Pacific Coast Diamonds, Etc.

Dr. David T. Day, chief of the mining statistics division of the Geological Survey, has completed his annual report, in which he says:

W. P. Carpenter of Placerville, Cal., who has from time to time reported the finding of diamonds in auriferous gravel, under the usual conditions of their occurrence, on the Pacific coast, has lately obtained two crystals—one weighing over seven grains troy and the other six, of rounded form and rough surface, each nearly one-fourth of an inch in diameter, and faintly tinted, the larger with a greenish shade and the smaller with a pale yellow. As many as forty or fifty small diamonds have been taken from the gravel at this place from time to time in the past; but since the stamp mills have been employed, little is found but the crushed fragments encountered in panning up. Mr. Carpenter proposes to work his section of the channel by other means and avoid the possible loss of diamonds of more value than the gold. The occurrence is similar to that of other California diamonds, in the hard, compacted, gold-bearing gravel occupying ancient river channels now filled and overlain by rocks. The rumor of the discovery of brilliant diamonds at Mount Edgecombe, near Sitka, Alaska, is without foundation, being denied by John G. Brady of Sitka, who says that the report arose from his remarking that diamonds might possibly be found on Mount Edgecombe, where, he thought, the geological formation presented resemblances to the South African diamond fields. In the chapter by George F. Becker, on a reconnaissance of the gold fields of the southern Apalachians, he states: The direct association of gold and diamond anywhere in the world is known only in one instance, and this has never before been described in print. Professor Arzruni showed me the specimen, exhibiting it some years ago, and now gives me permission to make it known. In 1887 the Royal Polytechnic High School at Aachen acquired from Ernst Winter, a diamond dealer in Hamburg, Eimsbuttel, a gray, opaque, flawed Kimberly diamond, which shows at two points inclusions of native gold in grains. It seems that this native gold must be considered as a constituent of the basic eruptive rock in which the Kimberly diamonds occur.

DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

For the half year ending June 30, 1895, a dividend has been declared at the rate of four and eight-tenths (4 8-10) per cent per annum on Term Deposits, and four (4) per cent per annum on Ordinary Deposits, free of taxes, payable on and after MONDAY, July 1st, 1895.

GEO. TOURNY, Secretary.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

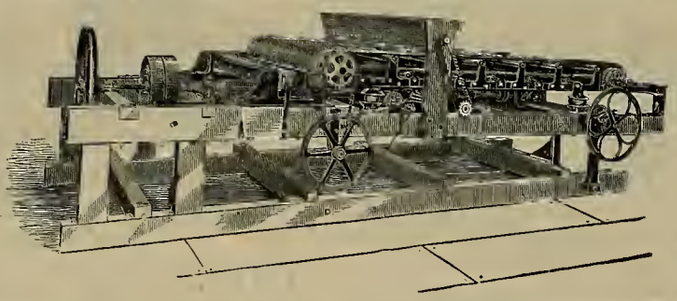
This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



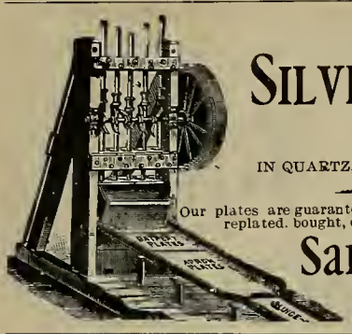
NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE ..... $350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY.—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent., from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Market Reports.

The Markets.

SAN FRANCISCO, July 3, 1895.

The markets have been practically unchanged since the last report, a good demand keeping metals throughout about at last week's figures.

By the fourth article of the Shimonoseki treaty the war indemnity to be paid by China is two hundred million taikwan talls, or 288,800,000 silver Mexican dollars. The taikwan is the imperial treasury tael.

That the price of wheat has for many years run on a line with that of silver is shown by the following return of the price of silver per ounce and the average price of English wheat since 1873. In that year the average price of silver was 59¼d per ounce; the average price of wheat 58s 8d per quarter. In 1874 silver was 58 5-16d, wheat 55s 8d; 1875, silver 56⅞d, wheat 45s 2d; 1876, silver 52¾d, wheat 46s 2d; 1877, silver 54 13-16d, wheat 56s 9d; 1878, silver 52 9-16d, wheat 56s 5d; 1879, silver 51¼d, wheat 43s 10d; 1880, silver 52¼d, wheat 44s 4d; 1881, silver 51 11-16d, wheat 45s 4d; 1882, silver 51½d, wheat 45s 1d; 1883, silver 50 9-16d, wheat 41s 7d; 1884, silver 50⅝d, wheat 35s 9d; 1885, silver 48⅝d, wheat 32s 10d; 1886, silver 45¾d, wheat 31s 2d; 1887, silver 44⅝d, wheat 32s 6d; 1888, silver 42¾d, wheat 31s 10d; 1889, silver 42 11-16d, wheat 29s 9d; 1890, silver 47 11-16d, wheat 31s 9d; 1891, silver 45 1-16d, wheat 37s; 1892, silver 39 13-16d, wheat 30s 4d; 1893, silver 35¾d, wheat 26s 4d; 1894, silver 28 15-16d, wheat 23s. That the present advance in wheat is in excess of present appreciation in the price of silver is accounted for by the fact that there is an enormous shortage in the wheat crop, the aggregate wheat yield being the least since '88, while the number of consumers has increased, an unusual factor in the great equation of supply and demand.

Mining Share Market.

SAN FRANCISCO, July 3, 1895.

Practically nothing was done this week, the exchanges adjourning last Tuesday till the 8th inst. The Comstocks advanced a little. Interest in the dilatory Hale & Norcross decision is unahated. It is thought that the decision will he favorable to the shareholders. They have been waiting with diminishing patience since the 22nd of last January, the stock meanwhile fluctuating from $5 to 75 cents. At present it is quoted at $1.10

The usual monthly financial statements are as follows:

Bodie Mines — Bodie, $16,187.75, Bulwer, $297.38; Mono, $2,238.34; Standard, $29,070.03.

Comstock Mines—Alpha, $5463.46; Alta, $5597.69; Andes, $14,534.07; Belcher, $925.80; Bullion, $2126.36; Best & Belcher, $195.35; Caledonia, $2723.98; Challenge, $294.19; Chollar, $23,837.12; Confidence, $5024.18; Con. Cal. & Virginia, $50,133.76; Con. Imperial, $331.98; Con. New York, $1674.76; Crown Point, $12,525.97; Exchequer, $1720.88; Gould & Curry, $3662.63; Hale & Norcross, $7279.50; Justice, $7092.66; Lady Washington, $1345.18; Mexican, $21,639.32; Occidental, $50.78; Ophir, $5923.98; Overman, $10,169.19; Potosi, $4331.05; Savage, $7753.56; Seg. Belcher, $3233.96; Sierra Nevada, $7278.64; Union, $3383.37; Utah, $270.13.

Indebtedness—Belle Isle, $2501; Navajo, $1305; North Belle Isle, $520; Silver King, $2947.

P. Kervin, superintendent of the Gould & Curry, Best & Belcher and Oshiston mines, has been appointed superintendent of the operations on the Brunswick lode, and work hegan thereon last Monday, a joint incline on that part owned by the Chollar and Hale & Norcross.

The following illustrates the changes of the week:

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Assessment Notices.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of June, 1895, an assessment, No. 2, of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the corporation, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on SATURDAY, the 27th day of July, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eleventh day of June, 1895, an assessment (No. 19) of Five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the sixteenth day of July, 1895 will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the sixth day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the twelfth day of June, 1895, an assessment (No. 45) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth day of July, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on TUESDAY, the seventh day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine St., San Francisco, Cal.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOULD AND CURRY SILVER MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the second (2d) day of July, 1895, an assessment (No. 76) of Fifteen (15c) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixth (6th) day of August, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the Twenty-eighth (28th) day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O.
Jan. 25, 1894.
The American Mining & Milling Machinery Co., Cleveland, O.:
GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,
CLEVELAND IRON ORE PAINT CO.

GREASE CUPS

Why is it that everybody calls for LUNKENHEIMER'S "Ideal" Automatic Grease Cup? Because it is a perfect Cup, simple and practical in operation, ornamental, low-priced. We also make other styles for various purposes: "Tiger," "Marine," "Jewel," "Ohio." All first class and warranted. "LUNKENHEIMER" on brass goods means the best. A trial will prove their superior merits. Our Catalogue will interest you. Gratis upon request.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

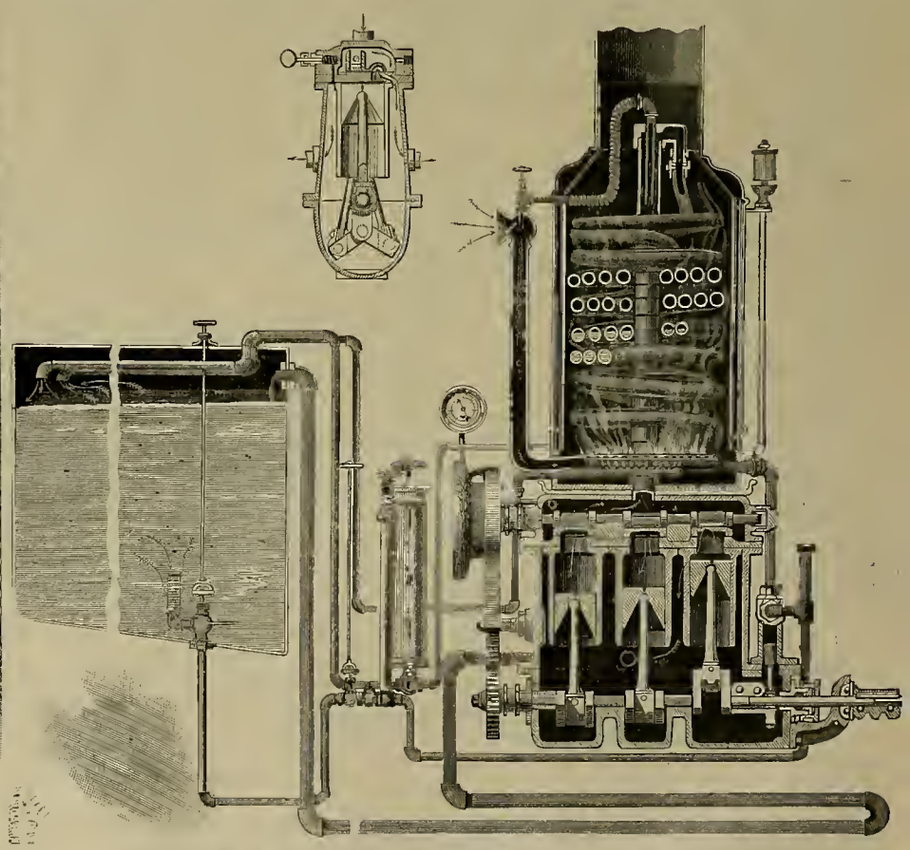
VOLUME LXXI. Number 2. SAN FRANCISCO, SATURDAY, JULY 13, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Naphtha Launch.



Among other forms of generating and utilizing power for marine purposes the naphtha launch attracts cousiderable present attention. Herewith is presented illustrations of an engine and hoiler of the American. The accompanying description is compiled from the *American Shipbuilder*, the *Scientific Machinist* and circulars published by the manufacturers—Amory, Harmon and Mayo, Morris Heights, near New York City:

THE NAPHTHA LAUNCH.

The engine is a three-cylinder, single-acting machine, especially constructed for naphtha, although it will work with steam or compressed air. It is surmounted by a douhle asbestos-lined jacket. Within the jacket is a coil of pipe, immediately helow which is a burner for naphtha gas, or vapor. A tank for holding the naphtha is placed in the extreme bow of the boat. From the tank a pipe connects with a small pump at the hase of the engine, hy which naphtha is pumped into the coil of pipe. Into the top of the coil boiler a pipe is tapped that supplies naphtha to the burner. In operation the coil is first made hot. This is done by hand-pumping naphtha vapor mixed with air into the burner, where it is lighted. When the coil is hot, naphtha is pumped into it. This is at once vaporized and develops pressure. The pressure is turned on the engine, which in a few minutes starts to rotate. An injector cock supplies the hurner with naphtha, drawing air in also, and the engine thercafter takes care of itself.

At each stroke naphtha is pumped iuto the coil hy the eugine. This develops in ordinary practice a pressure of sixty-five pounds in the heated coil. From the top of the coil the naphtha vapor, hefore it reaches the hurner, is drawn off and mixed with air after the fashion of the Bunsen burner. It hurns below the coil with a clear, hlue flame. Near the injector is a damper hy which the supply of air is regulated so as to produce this character of flame. After the naphtha vapor has acted upon the pistons and goes off through the exhaust it is condensed. A regular outhoard condenser is employed, the pipes running along outside the garhoard of the boat. The naphtha thus condensed is forced hack into the tank to be used over and over agaiu. The delivery of naphtha from the tank can he cut off by a special valve, which, however, in practice never need he closed.

SECTIONAL VIEW OF ENGINES AND BOILERS.

The eugraving shows its three cylinders with the piston rods bearing against hard steel cups beneath the pistons. Each piston is surmounted by its own slide valve, which slide valves are operated by a triple crank shaft. The burner and naphtha coils and the construction of the injector valve, nozzle and air damper are also made clear. Leading out to the right is seen the shaft, whose thrust is taken hy a hall hearing, which is seen in sections immediately forward of the after sleeve coupling. In starting it air is pumped into the naphtha tank, escaping therefrom highly carhurcted, so as to provide what is practically a gas for starting the fire. The whistle is blown by a hand pump, or in some of the boats an air tank is established forward, which is kept charged with compressed air hy the engine, and the whistle is blown by this air. The air tank is located immediately aft of the naphtha tank. The working parts of the engine are completely encased, so that all leakage of naphtha goes direct to the exhaust chamber. Another point of safety is that the fire is taken direct from the boiler, so that if the feed pump should fail to work, shutting off the naphtha supply at the hoiler, the fire would at once go out, and the engine would stop.

THE Fillmore-street line in this city has from Broadway northward for several hlocks a 25 per cent grade. Ordinarily this would be too steep; an auxiliary device is employed in the shape of a cahle and two sheave wheels, one at the top, the other at the bottom of the hill. Around these the cable turns; a stationary grip at the top is attached to the drawhead of the descending car; the grip at the bottom is similarly fastened to the ascending car. This is helieved to be the steepest grade on any electric railway in the country and could only he operated in the manner outlined herein.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Naphtha Launch; Sectional View of Engines and Boilers, 21.

EDITORIALS.—The Naphtha Launch, 21. Daily Receipts of Gold in This City; Mining Bureau Assistants; New System of Working Sulphurets; The Manufacturers' and Producers' Association; Fraud, Etc., Charged; Coal Deposits of Kachemak Bay, Alaska, 22.

CORRESPONDENCE.—Buying and Selling Mines; An Accomplished Woman Miner; Lake Superior Mining Machinery, 24.

MECHANICAL PROGRESS.—The Inertia Governor; American Inventors, 27.

SCIENTIFIC PROGRESS.—Improvement of Projectiles; Modern High Explosives; Waterproofing Brick and Sandstone; Testing Lubricating Oils to Detect Gum; Changes in Engineering Practice, 27.

ELECTRICAL PROGRESS.—Transmission of Energy Over a Single Conductor; The Gutta Percha Supply; Electricity by Cloud Formation; Studying the Arc Lamp's Light; Telephone Rates; Daily Consumption of Incandescent Lamps, 28.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 30-31.

PRACTICAL INFORMATION.—California Prehistoric Remains; Blew Itself Out; "Convergence of Ancestry;" An Important Decision; Private Electric Motors; An Inch of Rain, 32

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 34.

MISCELLANEOUS.—Concentrates, 23. War Against the Word Scientist; Telegraphing to the Most Distant Telescopic Stars; Calcium Carbide; Suing a Smelter; The Right of a Man to Defend Himself, 23. Statistics of the Railways of the United States for the Year Ending June 30th; Working Hard Materials with Diamonds Set in Metal; Tests with a 100-ton Testing Machine; Red Phosphorus, 25. Fluming Ore in Alaska; Colorado's Mine Commission; Coast Industrial Notes; Books Received; Lead Ore Importations; Reservoirs for Compressed Air, 26. Notices of Recent Patents, 35.

SOMETIME ago it was estimated that a million dollars per mouth was being received in this city from the gold mines of this State. It is believed that the present receipts will average ahout $50,000 daily. There is a constant stream from quartz, drift and placer mines, and more prospecting and development work is going on than has heen known for years before.

THE State Mining Bureau assistants in the field, detailed by State Mineralogist Crawford, have begun work. During the next ninety days W. H. Storms will work in Amador, Calaveras, Tuolumne, Mariposa and Madera counties; E B. Preston will operate in Butte, Plumas, Sierra, Lassen and Tehama counties; F. H. Mathyas iu Humboldt, Mendociuo, Del Norte and Siskiyou counties. W. L. Watts will continue his investigation of the southern California oil fields, his operations heing largely in Ventura, Los Angeles and Sauta Barbara counties; and J. H. Means will operate in Monterey, San Luis Ohispo, Kern and Kings counties. As a matter of puhlic interest and general value it is in order for any and all owners of mines, or any form of mineral interests, to co-operate with this State institution in furnishing information whenever desired.

IT is a pleasure to uote the practical efforts of the Manufacturers' and Producers' Association, which is doiug effective work in securing a fair opportunity for California's home industries. The State has everything that makes a great commonwealth, a great deal more than many other States in the Uniou, and coucert of effort is chiefly needed to make the matter of developmeut not so much one of silent precept as of active duty. The province and purpose of the Manufacturers' and Producers' Associatiou is not one of selfishness or exclusiveuess, as has been intimated. It is practical philanthropy, directing public attention to the fact forgotten or overlooked by so many that it is business to patronize home industries; that it is progress to pay the money that must be paid anyhow, for things of equal merit produced here, and that California goods made by men who employ Californians will have the preference where equal in price and quality. Two propositions are now before the Association—to put a distinctive lahel on goods of California manufacture and to incorporate the organization itself. The incorporation idea is feasible. The hadge of locality can best be determined by superiority of quality and increased attention attracted to the fact.

Coal Deposits of Kachemak Bay, Alaska.

The arrival at this port of the American hark Theohald with a cargo of coal from Alaska renews interest in Kachemak hay, Cook's Inlet, in the northernmost part of that territory. This coal indicates its prohable importance. Like all coals on this coast it has a considerable percentage of water, which, while against if for coking, is in its favor for other purposes. Tests, some of which were extended over a period of several months, of the coal have demonstrated that it burns clean, is remarkably free from soot and smoke and has good heating qualities, and while with a strong draft it will buru rapidly, yet with a light draft it will make a strong and hot fire lasting for a considerable time. From all information ohtaiuable it seems not unlikely that this coal may aid in solving the prohlem of cheap fuel supply for use in manufactures, steam vessels and some domestic purposes.

These coal deposits embrace a territory of 300 square miles. They underlie that portion of the peninsula hetween Kachemak hay and Cook's Inlet. How much of this is practically availahle has not as yet been determined, but surveys and examination have shown the existence of large quantities. Eighteen veins have heen examined, which vary in thickness from a few inches to five and six feet. The coal in these veins differs in quality, some heing of sufficient thickness aud character to warrant profitable working. As the entire geological formation of the coal deposits belong to the Miocene period, they are of a lignitic character, some being very frail, decomposing or crumbling on exposure to the atmosphere, while others are strong and highly carhonated and will stand shipment as well as any coast coal. Owing to their peculiar local conformation (dipping into the mountain at a decline of not more than two feet to the mile), they can be mined at a comparatively small cost, no shaft work or heavy pumping being required, ohviating the need of an expensive plant to he maintained.

Mr. George R. Tuttle, who has spent many years in coal and gold mining, made a personal visit to these coal deposits in Alaska. He says this coal is desirahle for grate and all kinds of domestic use, for which it takes rank alongside of Scotch Splint, while for manufacturing and general economic purposes these coals will he found among the hest varieties hrought to this market. Very little of the "Alaska Splint" coal has heen hrought to San Francisco, and that was taken from the outcropping of the vein, where it had become air-slacked and devitalized by exposure to the elements. It is thought that when the present company—the North Pacific Mining and Transportation Co.—shall have extended its mining operations farther into the formation, the quality of the coal produced will he still more desirable. While the distance to the coal fields is relatively much farther in miles than to our present hase of supplies in Washington and also iu British Columhia, yet the lesser expenses for mining, putting on vessels, and the ahsence of river tolls, harhor dues, towing, piloting, etc., will enahle the coal to be hrought from Alaska at sufficiently low cost to warrant entering into competition for the demand of this city and coast, and will yield to the owners a fair net profit.

The annual report of the Geological Survey is to hand; speaking of the production of coal in California during the past year the report says:

"The total product in 1894 was 67,247 short tons of a spot value of $155,620. The decreasing tendency of coal production in California noted in a preceding volume of the mineral resources continued in 1894. The largest product in any one year was ohtained in 1889, when it reached 121,820 short tons. In only one other year did it exceed 100,000 tons. This was in 1890.

"California coals are of inferior quality, mostly lignite and high in moisture or ash, or hoth. They can, however, and do, to some extent, act as a balancing wheel in keeping prices for other coal at a reasonable figure. Consumers are willing to pay higher prices for hetter coal, hut there is a limit beyond which it is found impolitic to go, and California lignites would be found cheaper fuel, notwithstanding their inferiority."

This fact should he horne in mind hy consumers in San Francisco, and encouragement should be giveu to the development of such mines as the State has. As it is, prices for coal in San Francisco have materially declined in the past few years. In 1890 English coal was selling at from $10 to $13 per ton. At the close of 1894 it was much cheaper. Such cheapening of fuel is of great henefit to manufacturers. It is true that the decline in value was originally due to heavy importations, chiefly in 1891, when the total receipts exceeded those of the previous years by nearly half a million tons and resulted in a glutted market, but unless there should he other resources for consumers to fall hack upon, the present low rate will not be apt to continue. The statistics for 1894 are as follows: Contra Costa county, total production, 39,200 short tons; Amador, Fresno and San Diego, 28,047 short tons, making a total for the State of 67,247 tons, valued at $155,620. In 1893 the total production was 72,603 tons and the total value $167,555.

FREQUENTLY California's annual gold yield is "going to he" exceeded hy that of other localities, hut so far statistics put it first iu the gold-producing localities of the continent. It is now asserted that the $15,000,000 gold which this State yearly produces will he exceeded hy the output of the Appalachian range, by reason of a new system of working sulphurets devised hy T. A. Edison. Mineralogists say that the free gold represents hut five per cent of the gold in Virginia and North Carolina; the other 95 per cent is sulphurets. Mr. Edison is represented as saying that he has an ore concentrator that will make profitahle the working of ore that goes $1 to the ton, and has hought a mine with "a great vein of pyritous gold ore" therein. He is also credited with having an "ore finder," which "operates on the principle of the compass," whereby "the needle is attracted, and not only the presence hut the character and extent of the ore helow the surface are indicated." The possession of all this should result in large increase in the gold output and augmentation of Mr. Edison's iudividual fortune, hut it is possible some of the newspaper statements may be slightly exaggerated, and very probahle that Mr. Edison is incorrectly quoted.

Electricity, the liveliest of all our electrical contemporaries, has for several months charged fraud, corruption, suhterfuge and general wrong doing among many most prominent in the electric husiness world, and of late claims that some of its contemporaries in that field are participants therein. In the current issue *Electricity* charges sundry electrical journals in New York and Chicago with dishonest methods and swindling intent. It goes on to assert that either the lines upon which the electrical husiness of the country has been conducted are fundamentally wrong, or else the electrical industry is a buhhle, the apparatus and devices sold not commercially practical, and the entire husiness of electric lighting and power transmission unstahle, short-lived and destined to give way to its competitors. It says that the past fifteen years have heen a period of dishonor and disgrace due to the lack of nerve and courage on the part of its contemporaries. This journal does not accept all these statements of *Electricity*. There is disappointment and jealousy and competition in the electrical world as anywhere else, and it is not likely that all the honesty, courage and good intent have found lodgment in the office of our virile contemporary. Yet it is evident that in more than one prominent instance the methods that alone insure permanent success have been ignored and practices permitted and perpetuated that are indefensihle. *Electricity* prohably says more than it means and aims higher than it desires to strike. Where not grossly ahused, the exercise of such criticism as that indulged in is usually provocative of good results, the danger being that exaggeration of statement and intemperance of language destroy all influence. One will heed a friendly warning or a sharp, deserved criticism, but continual scolding or constant vituperation rarely convert the sinner, electrical or otherwise.

Concentrates.

SANTA BARBARA is talking of an assaying and refining plant there.

FORTY-FIVE MEN are now at work at the Plumas-Eureka quartz mine at Johnsville.

A GOLD NUGGET weighing 146 ounces was recently found at Marble Bar, West Australia.

THE Morning Star gravel mine, at Iowa Hill, has declared another dividend of $3.50 per share.

THE Con. Cal. & Virginia carries over $33,525.56 into July with all the expenses for June paid.

THE Jackson Mining Company has been incorporated at Portland, Or.; capital stock, $16,000.

THE Eastern Washington Mining Company has incorporated at Spokane, Wash., capital stock, $50,000.

AT the Gwynfynydd and Clogan mines in Wales, 46,795 tons of gold ore stack '87 have yielded $442,830.

T. H. LEGGETT, F. Hollman and Jas. Meban sail from New York on the 21st inst. for Johannesburg, South Africa.

PERMITS have been issued by the Debris Commission to the Plumas Imperial and the Grizzly Bear mines, Plumas Co.

THE Pacific Bank mortgage of $22,000 against the Amador Queen mine was compromised for $15,000 last week.

THE "half-ton nugget of horn silver worth $80,000," recently found near Peach Springs, Arizona, turns out to be meteoric iron.

SINCE July 1 the charges for securing incorporation articles of a new company in Montana is $200; previously the cost was only $18.

A CHICAGO "mining paper" has an illustration of "a dry placer gold mining machine," with two streams of water running into it.

A POST OFFICE has been established at the Altoona quicksilver mine, known as Cinnabar. The Altoona is now producing 100 flasks a week.

HENRY GREENE, a pioneer miner of '49 and one of the original owners of the Gould and Curry, died last Sunday in this city in the 68th year of his age.

THE customs receipts at Rossland, B. C., for June amounted in round numbers to $7000. The mining receipts, with provincial taxes, reached a total of $3500.

THE Osceola Placer Company has resumed operations at Osceola, Nev. The two canals which supply the hydraulics are in use, and 100 men are employed.

THE *Record* says the Government will make preliminary survey of the mining regions of New Mexico and Arizona. A register of all the mines is to be made.

BRITISH COLUMBIA proposes a bonus of $30,000 a year for five years for aid to silver-lead smelting in that province at the rate of 15 cents per ton on the ore smelted.

J. B. HARRIS has bonded the Brunswick mine, Trinity Co., for $40,000, formerly owned by Weaverville parties, for sixteen months, with the privilege of prospecting.

MR. PRANGE, owner of the Sunset mine, Harqua Hala, Arizona, reports finding rich gold ore, which, in his opinion, justifies increasing his mill from ten stamps to sixty.

THE Golden Chariot Mining Co., in Ogilby district, San Diego Co., sixteen miles from Yuma, which recently added 60 stamps to their 20-stamp mill, are about to add 40 more.

THE Centennial-Eureka (Utah) mine last week declared an extra dividend of $1 per share, numbers 77 and 78, making the total amount of dividends paid by the property, $1,170,000.

THE gold output of the Witwatersrandt, S. A., district for May was 196,531 ounces, about 820 fine. Local journals estimate the year's output will be nearly 2,000,000 fine ounces.

A LONDON company is being formed to buy the Canyon Creek mines, Cœur d'Alene, Idaho; capital, $2,800,000. Nearly half a million has been spent in improvements and development.

THE Old Glory mine, Oro Blanco, Arizona, is now in the hands of a receiver, G. W. Cheyney. Suits have been brought for $14,000 by mining machinery men for money long since overdue.

PROFESSOR DALL and Dr. Becker of the Government Mineral Commission, now in Alaska, are reported to have discovered valuable nickel ore ledges at the head of Indian river, at Silver Bay.

THE Debris Commission have ordered the American House mine, in Plumas county, and the Cleveland mine, in Sierra county, to close down, on account of failure to comply with its directions.

IT is reported from Townsend, Montana, that the Diamond Hill mill and mine has been sold to a New York man for $1,500,000. J. S. Miller has been the manager and principal owner.

IT is reported that the turquoise mine near Tombstone, Arizona, is being worked at a profit. A recent shipment of fifty pounds of turquois was made to New York. Twenty men are working at the mine.

THE Ontario nickel mines, Leavenworth, Wash., have been bonded by Everett parties for $100,000. Sup't. Weber has charge of the work. The Ontario Mining Company has been organized; capital stock $500,000.

AT the Cananea (Mexico) mine last week the miners all struck for higher wages—$2 per day—an advance from $1.50. The raise was refused, and after a day in idleness the men returned to work at the old rate.

THE Butte & Boston Mining Company has begun a suit for $400,000 damages against the Lexington Mining Company for ore extracted from one of the plaintiff's mining claims by underground workings during 1894.

THE Troy Mining and Development Company has incorporated in this city, capital stock $100,000, of which $60,000 has been subscribed. Directors—M. Gruenberg, W. F. Mills, E. Hirshfeld, E. Stelzner and O. Ryst.

THE bullion statement of the Chollar mine for June is as follows: Worked at the Nevada mill, 420 tons of ore; gross proceeds in bullion, $11,468.74; cost of reducing, $2520; net proceeds in bullion, $8948.24; assay value per ton, $33.24; gross average per ton, $27.36; net average per ton, $21.36. Mill work up to 82.3 per cent.

MR. MCGRATH, of Los Angeles, has completed his roaster and chlorination plant at Hornitos, Mariposa Co., for treating the ore of the Quartz Mountain mine, lately bonded by himself and associates from the Brooks estate.

THE Cripple Creek district in Colorado is now credited with a gold yield aggregating $500,000 per month, a very handsome total, representing about the monthly output popularly credited to the Utica mine at Angels in this State.

DURING the thirty-one days of last March the sixty-stamp mill of the Alaska-Mexican Co. only stopped one and a half hours. The stamps weigh 1020 pounds and crushed 6677 tons of very hard quartz through a forty-mesh screen.

TWO REPORTS come from the Silver Star, Esmeralda, Nev., mine sale; one that Senator Wolcott and associates have paid the first $100,000, the other that they backed out and paid nothing. The first mentioned is probably the fact.

FRENCH MINING MEN who have been investigating the matter of deep level mining at the Witwatersrandt, South Africa, give it as their opinion that "the exploitation of Deep Levels will be as profitable as that of upper strata."

COLORADO SPRINGS reports machinery at work there pumping water, evaporating 108,000 gallons every 24 hours, and netting $63 gold therefrom. The report says "the water is lifted through a shaft from bedrock," which is probably correct.

THE Santa Rita Copper and Iron Company's mill at Santa Rita, east of Silver City, N. M., was burned last Saturday night. The machinery was the finest in the Territory, but had been out of use for a number of years. The loss will exceed $100,000.

MESSRS. CHARLTON AND BORNIO, of New Orleans, are about to resume operations at their silver mines, Planchas del Plata, twenty-five miles southeast of Nogales, Arizona. They have perfected title to five large claims and propose beginning with a ten-stamp mill now there to work the ore in sight.

THREE Americans, L. Demond, J. Crismore and H. Jeffrey, have fitted out an expedition at Escalon, Mexico, for the Sierra Madre mountains in search of a famous lost mine, La Fuente, which, according to tradition, contains a vast amount of ore of fabulous richness. The mine was abandoned by the Spaniards over a century ago.

RECENT Colorado mining incorporations are: The Invincible Gold Mining Company, Cripple Creek; capital stock, $500,000; the company owns four claims. The Blackstone Gold Mining Company; capital stock, $1,000,000. The Golden Link Mining, Leasing and Bonding Company; capital stock, $1,000,000; office, Colorado Springs.

AT the old Prietas mill at Minas Prietas (or La Colorado), Sonora, Mexico, two roasting furnaces of sixty tons each daily capacity are being put up, and the building erected on a scale which will admit the location of two more of the same capacity when needed. Those now in course of erection will treat daily 120 tons of Creston ore.

AT a recent meeting of the cabinet of Venezuela, the English concession for a vast tract of the Orinoco country, including the Bahia gold mines and part of the territory claimed by Great Britain, was revoked and a new concession granted to an American company. The latter immediately sent its men to take possession of the concession.

ABOUT sixty acres of beach sand, half way between Cape Flattery and the Ozett river, Wash., have been filed on as mining claims. Messrs. Flint, Downs and Pugh, of Spokane, have patented an invention to separate the gold from the black sand. The water is carried down from streams up the mountain in a flume for a distance of 1170 feet.

THE American Developing and Mining Company has filed its reincorporation papers in Jefferson county, Montana; the incorporation was originally made in February, 1892. Capital stock, $500,000. The trustees are J. H. Henley, A. Burrell, E. L. Whitmore, F. W. Bacorn and J. W. Astley, of Marysville; B. MacDonald, of Helena; and H. Burrell, of Sand Coulee.

THE Blossom mine, in the Cargo Muchacho district, has resumed work. The property belongs to San Francisco and Los Angeles men, and has been equipped with a ten-stamp mill and other necessary machinery, but has been idle for a long time on account of disagreement between its owners. The trouble is now reported settled and the mine will again be started up.

AN asbestos "boom" is reported from Quebec; the mines at Coleraine and Thetford, which have been mostly closed up, are resuming activity. The Bell Company is putting in three new machines for crushing the ore and separating the fiber from the rock, and the Jeffrey mine has been bought for $150,000 by a company which is building a factory for making asbestos tissue, and weaving it into cloth.

THE Oak Island Treasure Co. is among the romances of mining. It was formed to dig up the treasure supposed to have been concealed in Oak Island, Mahone Bay, N. S., by Captain Kidd. About $10,000 was spent last year in excavating at a point where the mysterious tunnel exists, the mouth of which is closed at all times, except during low tides. The company is getting a 30-H. P. engine ready to renew work.

A DEAL is reported on hand between the La Grange Hydraulic Mining Company and Mosten and Gallisen for 1800 acres of placer ground, or gravel, located between the Trinity river and the south fork of Trinity, heretofore undeveloped for want of capital. The price asked is $100,000, and the purchasers will have to build a 20-mile ditch at a cost of $75,000. The La Grange Company has sent two experts to report.

THE Anaconda Mining Company has recorded at Butte a certificate of diminution of its capital stock from $25,000,000 to $1,000,000, in accordance with a decision arrived at by the trustees at their recent meeting. The certificate states that the entire capital stock of the company, 1,000,000 shares, was represented at the meeting and all voted in favor of the proposition to diminish the stock to $1,000,000 and 40,000 shares.

SOME months ago it was noted in this column that the tailings at the Northern Belle, Candelaria, Nev., had been bought by a company who proposed to work them by a new method. Numerous inquiries have been received asking for a description of the method. So far the PRESS has been unable to procure a description of the process. The company has recently secured the tailings of the Eureka and Morgan mills, near Virginia, Nev. No plant has as yet been erected for reduction; our Nevada correspondents write that "the process is not known and is covered by nearly 100 patents."

AT Cripple Creek, Colorado, last Tuesday, in the miners' rock-drilling contests, the principal event was a double match, in which nearly twenty teams were entered and for which $1000 in purses were offered. The first prize, $500, was won by T. O'Neil and H. McMullen of Cripple Creek, who drilled 33⅞ inches in ten minutes. Davy and Fallow of Butte, Mont., took second prize, $250, drilling 33¼ inches.

FRANKLIN LEONARD, president of the Comstock Tunnel Company, has returned to New York and will recommend to the directors that the Comstock Tunnel Company pay half the expense of exploring the Brunswick lode upward from the 1300-foot level, and that branch tunnels be run to tap the American Flat and Sierra City districts from points reached by the south lateral branch of the main tunnel.

DR. MOHN of Los Angeles recently had J. Culley arrested, alleging embezzlement. Mohn engaged Culley to examine some mines in Sonora, Mexico, giving him $150 for expenses. On his return he reported the mines were not as represented. Mohn wanted the $150 back, but Culley claimed that was for his expenses, and refused to refund. When the case came up for trial he proved his claim and was promptly discharged.

THE assayer of the Boise, Idaho, assay office reports for the fiscal year ending June 30th the total receipts of the office were $1,225,101. The receipts for the previous fiscal year amounted to $801,138.33, showing an increase in favor of the past year of $424,962.67. The receipts for the year just closed were the largest in the history of the office. A bar of bullion was received from the Virtue mine, at Baker City, July 3, valued at $25,592.07. The bullion is worth $19.46 per ounce.

THE Lum Gray group of mines near Ehrenberg, Arizona, have been bonded to A. M. Wells. The new owners will construct a railway from the Colorado river to the mines, a distance of twenty-three miles in an air-line. The cost of construction will be $1200 per mile. The mill will be constructed some fifteen miles above Ehrenberg, on the river, and wood and water (the latter in tanks) for use at the mines will be transported by rail. Four tramways will be constructed.

AT the Brown Bear mine, Deadwood, Trinity Co., Sup't. Dobler pays 40 men $2.50 per day; they pay $20 per month for board. The others employed are lessees who work on halves. In the fifteen-stamp mill ten run continually for the company and five for the lessees. Lambert and Grayson, the former owners, took out nearly $600,000 and then sold the mine for $11,000. It still pays very well. Considerable prospecting is being done, there being over ten miles of tunnels in the mountain.

ELECTRICIAN E. M. TALBOT of the Anaconda Electric Light and Power Company was instantly killed last Sunday at the power-house, two miles from Anaconda, Montana. A pulley on a shaft burst, and a fragment struck Talbot on the head, fracturing his skull. He had been at the operating lever, and left it for a moment, and while he was away, the machinery got away and was whirling at a terrific rate when he entered the door. Talbot ran to the lever; but as he reached it, the pulley burst, the iron struck him and he fell dead. The remains will be shipped to Pomona, Cal., for interment.

D. GOLDBAUM of Ensenada has sold his half interest in the San Fernando copper mine, Lower California, to E. C. Humphreys, representative of the Woods Investment Company of Victor, Col. A stock company has been organized to develop the San Fernando and other properties in Lower California, to be known as the San Fernando Mining and Smelting Company. The other mines owned by the company are the Altar, Delfino, Zahara and San Mateo, situated in the San Isidro and San Antonio districts, about fifty miles south of Ensenada. The San Fernando mine, which is below San Quintin, is a copper producer.

JANUARY 18, 1837, standard silver coin of the United States was made legal tender for any amount. February 21, 1853, half-dollars were made legal tender for only $5. February 23, 1873, trade dollars were made legal tender, but on the 22d of July, 1877, they ceased to be such. February 28, 1878, silver dollars of the weight of 412½ grains were made legal tender for all debts. June 2, 1879, an act was passed declaring that silver coins of less value than one dollar should be legal tender to the extent of $10 only. These two acts are still in force. Five, three and one cent pieces are legal tender to the amount of 25 cents.

THERE will be no mining exposition in Denver in '96, nor early in '97, so far as any present arrangements are concerned. The managers claimed subscriptions amounting to about $300,000, but when they published the list last week it was but $75,000. Of this amount D. H. Moffat, the largest stockholder in the water company, and president of the First National Bank, had subscribed $50,000, which he withdrew. As this left but $25,000, there was no hopes of raising the $500,000 necessary to start the show, and about $2,000,000 to carry it through, so it has been abandoned.

SUPERINTENDENT KERVIN of the Gould & Curry and Best & Belcher mines has taken charge of the new prospecting operations on the Brunswick lode. Two inclines will be run in the ground recently purchased by the combination of Comstock companies. These inclines will be put down in chimneys that show fair low-grade ore at the surface. It has been thought better to start in ore and follow it down—thus keeping track of it—than to make an upraise from the Sutro tunnel level, nearly 2000 feet below. It will probably be more satisfactory to all concerned to follow the ore down than to work by guess from below. When a bonanza is found it will be an easy matter to tap it from below.

THE Croydon Quartz Crushing Company, of Queensland, reports the erection of the "largest cyanide plant in the Australian colonies," at a cost of close upon £6500. "Up to date," the report states, "16,182 tons of tailings have been treated, the bullion from which was valued at £13,244 18s 10d, clear of bank charges. From this a dividend equal to 10 per cent has been declared, and regular monthly dividends are anticipated for the present. The total cost of extraction, including the 10 per cent depreciation written off, amounted to 7s 6d per ton of tailings treated. The value realized was 16s 6d, on which 1s 4d per ton was paid as royalty, thus leaving a profit of 7s 8d per ton; which would be raised to 9s a ton if the royalty could be got rid of." The amount paid as royalty to the Australian Gold Recovery Company for the use of the cyanide patents is £1066 18s 11d.

Buying and Selling Mines.

TO THE EDITOR:—I observe in your issue of June 29th a rejoinder by "Miner Too" to my communication of the previous week, on the subject of "Buying and Selling Mines." He takes exception to my statement that parties to whom mines are offered by men or syndicates with ample capital to buy them themselves, ask why they should be allowed to go abroad for a market, if so good. "Miner Too" thinks the standing and responsibility of such a syndicate should inspire confidence, and the proposed investor would rely upon such as a guarantee of the merit of the mines offered. My experience does not bear out that theory, and I have had as much as almost any one who has undertaken the sale of mines abroad, and in our own country, and I have found that more business could be done individually, under direct authority of the owner of the property, than through a syndicate or capitalists, as the very fact of its being in such hands implied a heavy commission, which is of course added to the price of the property, and that the purchaser well knows. As a proof of the fact of the soundness of my opinion that no syndicate can, or ever has, succeeded as a business in selling mining property, I ask "Miner Too" to name a single instance where any one of dozens of similar associations of capitalists and "respectable gentlemen" have ever sold any important properties here, or elsewhere. It will be found that all sales have been made by an individual representing the owner, or under a bond from the owner. If, however, this proposed syndicate of highly respectable gentlemen *can* inspire that confidence necessary to bring out investors in our mines, I say for one, for Heaven's sake let us see them sail in, and bring us "shekels" galore. I shall be only too glad to be proven wrong and "don't know a —— thing about it." We will wait and see how the thing pans out, and if I am wrong, will acknowledge it like a man.

"Miner Too" resents the proposition of the advance of capital to develop dormant properties, build mills, do all the work, that the owner never will and never can, and calls a fair share of the result "robbery." It is a harsh term for setting a miner on his feet, and giving value to his property, which he never could realize a red cent from otherwise, and grows old and gray waiting for some green man to come along and buy, what? a hole in the ground that shows nothing.

Which is better, a realization of a positive value on the result of the development, even if but half, or letting the claim lie dormant, from which by the owner's own efforts there never will be a day's work done? On the principle that half a loaf is better than none, is it not better to give away half that is not worth a dollar, to make the other half worth, may be, thousands? It does not require much profound thinking to come to a conclusion on that proposition. In conclusion, I want to remind "Miner Too" not to forget to call my attention to any of the heavy sales that are to follow the organization of this syndicate, for I shall be greatly pleased to hear of such, and will "whooray" louder than any man in the State, and with a "bully for you" as a tiger. MINER.

July 10, '95.

An Accomplished Woman Miner.

TO THE EDITOR:—I have spent the month of June in the Humboldt mountains, looking over good gold prospects. The main claim is called the "Lost mine." It was opened thirty-one years ago, prior to the advent of the railroad. A shaft was sunk on the vein about twenty-five feet, it averaging about $75 per ton gold. At that time it would not pay, owing to the excessive cost of mining material and labor. During the past four years persistent searches were made for the mine, but each time were abandoned, until this spring when a cultured woman of the new age appeared in the person of Mrs. Ida M. Strohridge, in company with a young man lately employed on her father's ranch near Humboldt. She is a most remarkably bright woman, and will climb a precipitous cliff where the average man would not dare to venture. In addition to mining she looks after the business of her father's cattle ranch, and is quite a sportswoman and would probably carry off the first prize in a shooting tournament, as she brings down her game every time. She wears a handsome brown denim costume, which she dons in climbing the very steep and rugged cliffs of the Humboldt mountains. She has located five claims on the lode, laid out a new camp and named it after her father, "Meacham," and reorganized the district anew as the "Humboldt;" she has four men to work and is superintending operations herself. She has also located the water and springs flowing over the claims, which are nine miles east of the Central Pacific Railroad, at the Humboldt House. Such is the New Woman.

The Lost mine can be traced a distance of 2200 feet along the vein, from twelve to eighteen inches wide and crops out from six to twenty-four feet in height. It is a white and rose-colored quartz, which, when broken, shows the free gold quite plainly, and assays range from $6.50 to $340 per ton; the average is about $85 per ton gold. Mrs. Strohridge is now engaged running a tunnel under the shaft where the vein is showing up finely, and if the present appearance is maintained the New Woman will in due time be reckoned as a millionairess, and all by her indomitable will and perseverance. She is now sacking ores for shipment. TRAVELER.

Carson, Nevada, July 3, '95.

Lake Superior Mining Machinery.

TO THE EDITOR:—The wonderful deep mining of the Lake Superior native copper mines requires very powerful machinery for the safe and successful hoisting of the skips and cages laden with the miners and the heavy copper-bearing rock.

The construction of this machinery deeply interests those who work in the mines and the capitalist who is financially interested, therefore it is not to be wondered at that any innovation or deviation from an accepted standard is criticized by the mechanical mining man and is a source of anxiety to the miner who risks his life the moment he steps into the cage to descend or ascend the shafts at a speed nearly that of a first-class passenger train on surface.

The report that the Tamarack Mining Co.'s new hoisting engine and drum at the No. 3 shaft did not work satisfactory affected the shares of that mine in the stock market. That there was apparent cause for such a report was substantiated by the necessity of the presence of Mining Engineer E. F. Neukom, the designer for the contractors E. P. Allis & Co. of Milwaukee, before the machinery, which cost over $100,000, was recommended for acceptance to headquarters by Supt. W. E. Parnall.

Mining Engineer Neukom was clothed with authority to make a rigid and fair test of the engines without being hampered in any way by the mine officials. His three days' test resulted in the machinery performing all that was required of it as near as any engine can do with 90 pounds of steam pressure, whereas the contract specifies 100 pounds pressure.

For three days the maximum load was raised and lowered without a balance weight attached. The engine started easily and free at any point in the shaft; it made no difference if the load was in the bottom or near the surface. The engine, in performing its regular work, will never be called on to do as much work as was performed during the three days' test, which was made under the very worst conditions.

The capacity of the engines is nearly 2000 horse power. The double cone drum is the new feature. The drum carries 7000 feet of inch and three-eighth steel cable on each side, or 14,000 feet total. The machinery will ultimately be required to hoist three tons, besides the weight of cable, from a depth of 7000 feet at a speed of from 2500 to 3000 feet per minute. The drum is the largest in the world, being 36 feet 6 inches in diameter, weight 340,000 pounds, diameter of shaft 28 feet 6 inches, length 33 feet 6 inches. The shaft crank and center hub weigh 62 tons.

The engines began their routine work this week, and the engineers who are in charge, as well as the mine officials, are elated over the efficiency and smoothness of the running of the engines that are now hoisting from the deepest mine in the world.

Houghton, Mich., July 2, 1895. A. F. ISLER.

WAR is being waged in England against the use of the word scientist. The Duke of Argyll, Sir John Lubbock, Lord Rayleigh, Lord Kelvin and Professor Huxley unreservedly condemn the word; Sir John Lubbock proposes philosopher instead; Lords Rayleigh and Kelvin prefer naturalist. Professor Huxley thinks that scientist must be about as pleasing as electrocution to any one who respects the English language. Grant Allen, while disapproving of the word, thinks it is pedantry to object to a new word when it is used by a majority of the persons; after the camels of altruism and sociology, scientist is comparatively a gnat. Alfred Wallace alone is not disturbed by the word; he describes it as useful, and argues that, since we have biologist, geologist, chemist, physicist and specialist, we might as well use scientist, and he further asks, "What is there to use instead?" *Science Gossip* says the word was first invented and used by Whewell in his "Philosophy of the Inductive Sciences."

SIR ROBERT BAU says that, going at the rate of the electric telegraph—that is, 186,000 miles a second—it would take seventy-eight years to telegraph a message to the most distant telescopic stars, but the camera has revealed stars far more distant than these, some of which, if a message had been sent in the year A. D. 1—that is to say, 1894 years ago—the message would only just have reached some of them, and would be still on the way to others, going at the rate of 186,000 miles a second.

Calcium Carbide.

At the last meeting of the California Academy of Sciences, a reading and exhibition of acetylene gas derived from calcium carbide was given by E. C. Jones, assistant engineer of the Pacific Gas and Improvement Company. He said the secret of combining calcium and carbon was divulged by the high temperature of the electric arc and was purely accidental.

In 1893 L. T. Willson of Spray, North Carolina, devised a process for reclaiming metallic aluminum by means of an electric furnace, but was debarred from carrying on his work by an injunction obtained by another company having similar patents. He then turned his attention to the utilization of his furnace for the purpose of obtaining the metal calcium by reducing lime with finely divided charcoal. He found that at the temperature of the electric arc an inter-action took place, which resulted in the evolution of carbon monoxide and light behind a fused mass which solidified to a very hard semi-crystalline body. This mass was thrown into water to cool it, as it was apparently useless material, but an instant evolution of large quantities of gas attracted attention. It was found to be calcium carbide, which is composed of forty parts by weight of calcium combined with twenty-four parts of weight of carbon. On adding water to the carbide a double decomposition takes place. The oxygen of the water combines with the calcium, forming lime again, while the hydrogen unites with the carbon of the carbide to form acetylene gas. Mr. Willson gave an estimate of the cost of making carbide, from which the gas is manufactured, based on his experience, at about $15 per ton. It appears, however, that Mr. Willson had underestimated the cost of the carbide, or else the dealers are realizing excessive profits, for an aluminum company in Neuhausen, Switzerland, is manufacturing calcium carbide and offering it for sale at about $110 per ton.

The cheap production of acetylene opens a new and fascinating field for the student of chemistry, for acetylene is regarded as one of the most important intermediate bodies in the synthesis of organic compounds from these elements. By heating it in a sealed tube, it is converted into benzine and styroline and alcohol, and all of the cyanides may be synthesized from it—in fact, the scope for research opened by this discovery is so great that the effect on organic chemistry will be revolutionary.

Suing a Smelter.

A mining suit involving $450,000 has been begun in the District Court by A. M. Hendry against the Pueblo Smelting and Refining Company for the value of ore claimed to have been taken by the smelting company from a mine belonging to Hendry, and converted to its own use.

Five years ago Hendry went to the New Placer mining district, Santa Fe county, N. M., purchased the Anaconda mining claim, paying therefor $25,000, and sunk a shaft. Adjoining the Anaconda is the Lincoln Lucky mine. The ore, which is a sulphide, lies in a pipe and runs from the Lincoln Lucky into the Anaconda. Hendry claims that the Lincoln Lucky people followed the vein beyond their lines into the Anaconda territory and extracted 4500 tons of ore, which he estimates worth $100 per ton. The smelter returns show that over 4000 tons were shipped to the smelter. The purchasing agent of the smelting company, who is also interested in the Lincoln Lucky, and one or more of the latter company, it is said, had full notice that the ore was claimed by Hendry at the time it was shipped to the smelter, and on that ground it is claimed that the smelting company is liable, as they must have known they were buying ore from the Anaconda. Hendry also notified them formally, it is said, of his ownership of the mine.

Hendry has been in litigation over his mine ever since the purchase, and it is now in the Santa Fe courts. The Lincoln Lucky owners claimed that the location had been made on a Spanish grant and was therefore void, but this grant was set aside by the United States Government, leaving Hendry's title, he claims, intact. In the litigation which has just commenced the smelting company will probably dispute Hendry's ownership of the mine and set up apex rights and surface locations.

THE right of a man to defend himself on his own premises has been vindicated by the United States Supreme Court in an Arkansas case. A man with two others came on the premises of his brother-in-law to seize a cow. He drew a revolver to intimidate the owner of the animal, and was thereupon struck and killed. The court at the trial held that this killing was not justifiable, as the man must retreat inside his dwelling-house before he had a right to fire in self-defense. The Supreme Court overrules this decision. It holds that a man on his own premises is where he has a right to be. If he did not provoke an assault, and believed his life in danger, he was not obliged to retreat, and was justified in meeting force with force. This is common-sense doctrine, and it is gratifying to know that the highest court has affirmed it to be good law.

Statistics of the Railways of the United States for the Year Ending June 30th.

The seventh statistical report of the Interstate Commerce Commission is received, of which the following isan abstract. In the introduction of the report especial attention is called to the peculiar conditions affecting the operation of railways during the year covered by the report. First, the report covers the last four months of the Columbian Exposition, during which time there was an increased passenger traffic. Second, it covers a period of widespread and unprecedented business depression. Third, on June 30, 1894, 192 roads, operating upwards of 42,000 miles of line, and representing about one-fourth of the total railway capitalization, were in the hands of receivers. The effect of these conditions is apparent in nearly all of the figures presented.

Mileage.—The total railway mileage in the United States on June 30, 1894, was 178,708.55, an increase during the year of 2,247.48 miles. The increase during the previous year was 4,897.55 miles. The percentage of increase in 1894 was less than for any preceding year for which reports have been made to the Commission, and it is not probable that the year ending June 30, 1895, will show much improvement. The State of Pennsylvania shows an increase of 300.20 miles; Florida 234.82, North Dakota 195.54, Ohio 184.02, Georgia 162.71, Maine 125.60, Missouri 120.51, West Virginia 117.56, and Minnesota 116.49. The States of Kansas, Maryland, Massachusetts, Nevada, New Hampshire, North Carolina, Vermont, Virginia, and the Territory of Arizona, show slight decreases in mileage, due to remeasurements and abandonment of lines, aggregating 153.72 miles. The number of roads abandoned was 16. The total mileage of all tracks was 233,533.67 miles, which includes 10,499.30 miles of second track, 953.16 miles of third track, 710.99 miles of fourth track and 42,661.67 miles of yard track and sidings.

Classification of Railways.—The total number of railway corporations on June 30, 1894, was 1924, an increase during the year of twenty-two. Of this number 745 were independent operating companies and 945 maintained separate operating accounts. The number of companies maintaining financial accounts only was 804, of which 334 were operated under lease for a fixed money rental, and 190 for a contingent money reutal; 243 were controlled through the ownership of stock by the operating company; the remaining 37 returned no information as to the form of control. The number of roads not in operation was 77, of which 60 were independent roads; ten were subsidiary roads, parts of systems, and seven were private roads. In addition to the roads already referred to there were 98 private roads operated in connection with logging, milling and mining industries. The movement of consolidation during the year on the basis of mileage involved has been greater than for the year previous; fifteen roads, representing 1734.64 miles, have been merged; twenty-two roads, representing 2351.99 miles, have been reorganized, and fourteen roads, representing 1590.34 miles, have been consolidated. A classification of railways on the basis of operated mileage shows that 44 roads, each with a mileage of over 1000 miles, operate 100,547.29 miles of line, or 56.30 per cent of the total mileage of the country; twenty-three roads, each with a mileage of over 600 and less than 1000 miles, operate 17,918.35 miles of line, or 10.3 per cent of the total mileage; twenty-three roads, each with a mileage of 400 and less than 600 miles, operate 11,724 miles of line, or 6.57 per cent of the total mileage; forty-two roads, with a mileage of over 250 and less than 400 miles, operate 13,508.82 miles of line, or 7.56 per cent of the total mileage; and 907 roads, each with a mileage of less than 250 miles, operate the remainder of the mileage, 34,910.26 miles, or 19.54 per cent of the total mileage. From this it will be seen that 90 roads, representing the first three classes, operate 72.90 per cent of the entire mileage of the country.

Equipment.—On June 30, 1894, the total number of locomotives was 35,492, an increase during the year of 704. Of these, 9893 were passenger locomotives; 20,000 were freight locomotives; 5089 were switching locomotives; and 513 were unclassified. The total number of cars reported was 1,278,078. Of these, 33,018 were in passenger service; 1,205,169 were in freight service; and 39,891 were caboose, derrick, gravel, officers, pay, and other cars in the company's service. These figures do not include cars owned by shippers or private individuals. The increase in the number of cars during the year was 4132, as against an increase of 58,854 during the previous year. This falling off in the ratio of increase is due to the fact that the railways have during the year destroyed a large number of old, wornout cars. The number of passengers carried per passenger locomotive was 62,639, and the passenger miles per passenger locomotive were 1,444,400. The number of tons carried per freight locomotive was 31,909, and the ton miles per freight locomotive were 4,016,755. With the exception of the item of passengers carried, these figures show a decrease in the efficiency of locomotives. The number of passenger cars per 1,000,000 passengers was 53, and the number of freight cars per 1,000,000 tons of freight was 1888. During the year 1579 locomotives and 30,386 cars were fitted with train breaks, and 1197 locomotives and 34,186 cars were fitted with automatic couplers. While the gain in the use of both these safety appliances is largely in excess of the increase of equipment during that year, it cannot be considered as showing a marked tendency toward compliance with the law, as 74.80 per cent of the total equipment is still without train brakes and 72.77 per cent without automatic couplers. The law requires that all equipment shall be supplied with these safety appliances before January, 1898, while it requires that all cars shall be provided with grab irons or hand holds and drawbars of a standard height by July 1, 1895.

Employees.—The total number of railway employees on June 30, 1894, was 779,608, a decrease, as compared with the number on June 30, 1893, of 93,994, or 10.76 per cent. This is a smaller number employed than in any year since 1890. This decrease is, of course, due to the heavy falling off in traffic and the endeavor of the railways to economize. On the basis of four persons being dependent on each wage earner, it shows that over one-third of a million of people have been deprived of their regular means of support. The class of employees showing the greatest decrease are trackmen, the decrease of this class being 29,443, or 16.34 per cent; the next largest decrease is 19,890, or 18.91 per cent, for laborers and other unclassified employees. The decrease in employees assigned to general administration was 3635, or 10.27 per cent; in employees assigned to maintenance of way and structures 40,841, or 15.94 per cent; in employees assigned to maintenance of equipment 23,490, or 13.38 per cent, and in employees assigned to conducting transportation 32,023, or 8.05 per cent. Localized, the largest decrease is in Group VI, 26,168, or 15.36 per cent, and Group III comes second with a decrease of 20,680, or 14.99 per cent. A new feature in this report is a table giving a comparative statement of the average daily compensation of the various classes of railway employees for 1892, 1893 and 1894. For 1894 the average daily compensation was for general officers $9.71, other officers $5.75, general office clerks $2.34, station agents $1.75, other station men $1.63, enginemen $3.61, firemen $2.03, conductors $3.04, other trainmen $1.89; machinists $2.21, carpenters $2.02, other shopmen $1.69, section foremen $1.71, other trackmen $1.18, switchmen, flagmen and watchmen $1.75, telegraph operators and dispatchers $1.93, and employees of floatiug equipment $1.97.

Capitalization and Valuation of Railway Property.—The total amount of reported railway capital on June 30, 1894, was $10,796,473,813, or $62,951 per mile of line. This is an increase in the amount outstanding during the year of $290,238,403. The amount of capital stock was $4,834,075,659, of which $4,103,584,166 was common stock and $730,491,493 was preferred stock. The funded debt was $5,356,583,019, classified as follows: Bonds, $4,593,931,754; miscellaneous obligations, $456,277,380; income bonds, $242,403,681, and equipment trust obligations, $63,970,204. The amount of current liabilities was $605,815,135. The amount of railway securities held by the railways as an investment was $1,544,058,670, a decrease during the year of $18,963,563.

The amount of stock paying no dividend was $3,066,150,094, or 63.43 per cent of the total amount. Of the stock paying dividends, 4.31 per cent of the total stock paid from 4 to 5 per cent; 10.12 per cent paid from 5 to 6 per cent; 5.12 per cent paid from 6 to 7 per cent; and 5.42 per cent paid from 7 to 8 per cent. The total amount of dividends was $95,575,976, or an average rate on the dividend-paying stock of 5.41 per cent. The amount of bonds paying no interest was $650,573,789, or 14.17 per cent. The amount of miscellaneous obligations paying no interest was $53,426,264, or 11.71 per cent, and the amount of income bonds paying no interest was $210,757,554, or 86.94 per cent.

Public Service.—The number of passengers carried was 619,688,199—an increase over the previous year of 26,127,587. This increase is almost wholly in Groups III and VI, and was occasioned by the World's Fair travel. The passenger mileage was 14,289,445,893. The average number of passengers in a train was 44, and the average distance traveled by each passenger was 23.06 miles. The passenger mileage per mile of line, which indicates the density of passenger traffic, was 81,333—a slight decrease as compared with the previous report. There was a large decrease in freight traffic, the number of tons carried being 638,186,553, as against 745,119,482 in 1893—a decrease of 106,932,929 tons. The ton mileage was 80,335,104,702—a decrease of 13,253,007,131 from the previous year—and the ton miles per mile of line decreased from 551,232 in 1893 to 457,252 in 1894—a decrease in density of traffic of 93,980 ton miles. The average number of tons in a train was 179.80—a decrease of 4.17 tons, showing a decrease of economy in the use of freight equipment. The average haul of one ton was 125.88 miles.

Earnings and Expenses.—The gross earnings of the railways for the year ending June 30, 1894, were $1,073,361,797, a decrease as compared with the previous year of $147,390,077, or 12.07 per cent. Passenger revenue decreased $16,142,258, or 5.35 per cent, and the revenue from freight traffic decreased $129,562,948, or 15.63 per cent. The amount of operating expenses was $731,414,322, a decrease of $96,506,977, or 11.66 per cent. The largest per cent of decrease was in the operating expenses assigned to maintenance of way and structures and to maintenance of equipment, which show, respectively, a decrease of 15.12 and 17.52 per cent. The net earnings were $341,947,475, a decrease of $50,883,100 as compared with the previous year. The income derived from sources outside of operations was $142,816,805. The amount of fixed charges and other deductions from income was $429,008,310, leaving a net income of $55,755,970 available for dividends, a decrease as compared with the previous year of nearly 50 per cent. The amount of dividends paid was $95,575,976, a decrease of only $5,353,909 from the amount paid the previous year. The fact that nearly the normal amount of dividends was paid notwithstanding the great decrease in income available for them, and that the payment of the amount stated entailed a deficit from the operations of the year of $45,912,044, is suggestive. The revenue derived from the carrying of passengers was $285,349,558, or 26.58 per cent of gross earnings, and the revenue derived from freight traffic was $699,490,913, or 65.16 per cent of gross earnings.

Accidents.—During the year 1823 railway employes were killed and 23,422 were injured, as compared with 2727 killed and 31,729 injured in 1893. This marked decrease in casuality is in part due to the decrease in the uumber of men employed, and the decrease in the volume of business handled. The increased use of automatic appliances on railway equipmeut also may have rendered railway employment less dangerous and it may be that the grade of efficiency of employes has been raised.

The number of passengers killed was 324, an increase of 25, and the number injured was 3304, a decrease of 195. Of the total number of fatal casualties to railway employes, 251 were due to coupling and uncoupling cars, 439 to falling from trains and engines, 50 to overhead obstructions, 145 to collisions, 108 to derailments, aud the balance to various other causes not easily classified. To show the ratio of casualty, it may be stated that one employe was killed out of every 428 in service, and one injured out of every 33 employed. The trainmen perform the most dangerous service, one out of every 156 employed having been killed and one out of every 12 having been injured.

The ratio of casualty to passengers is in striking contrast to that of railway employes, one passenger having been killed out of each 1,912,628 carried, or for each 44,103,228 miles traveled, and one injured out of each 204,248 carried, or for each 4,709,771 miles traveled. A distribution of accidents to the territorial groups exhibits the diversity in the relative safety of railway employment and of railway travel in the different sections of the country.

Conclusion.—In concluding the report the statistician renews the recommendatious made in previous reports in regard to the desirability of requiring annual reports from express companies, corporations, companies and persons owning rolling stock used in interstate commerce; corporations, compauies and persons owning depot property, stock yards, and elevators used by interstate carriers, and from carriers by water that compete with railways for traffic. Refereuce is also made to the question of requiring railways to report freight earnings by commodities. On account of the present depressed financial condition of railways, it has been decided to let this matter rest another year, although there is no question as to the desirability of such reports.

In working hard materials with diamouds set in metal there has always been a difficulty in preventing the stone from being ripped out by the strain. An effective method of doing this has been devised. A little block of steel, suitably notched to receive the diamond, is brought to a red heat, the diamond is inserted, and the block is passed through a small roll. The diamond is thus firmly imbedded in the block, though projecting slightly beyond its surface, and defies the strain of the most exacting work.

While conducting a series of tests with a 100-ton testing machine at the Yorkshire College in England, which included the testing of a steel wire rope, Prof. Goodman stated that such ropes were not a modern invention, and that he had recently seen a bronze wire rope one-half inch in diameter and from twenty to thirty feet long, which had been buried in the ruins of Pompeii and which must have been at least 1900 years old.

Red phosphorus combines with chlorate of potash to make an explosion of great violence. The London *Lancet* thiuks that if this fact of chemistry had been more generally known it might have saved the disagreeable consequences which recently followed when a man who had not studied chemistry put his safety matches into the same pocket with his throat lozenges.

A man standing at the equator is sweeping through space at the velocity of 509 yards per second.

Fluming Ore in Alaska.

To THE EDITOR:—Perhaps a word from this distant part of our common country might not be uninteresting to your readers, and possibly the matter upon which I wish to write may be new to some of them.

We have put into operation here a method of ore transportatiou which, where conditions are favorable, might be employed elsewhere to very great advantage and economy. These conditions are plenty of water at mine and a fall of not less than one-half inch to the foot to the point to which ore is to be conveyed.

Our mine is situated one mile from mill; elevation above mill over 600 feet. The proposition that confronted us was how to convey the ore to mill at least cost, both as to construction and operation of means employed. All the usual methods were out of our reach either because of excessive first cost or subsequent operation. We had abundance of water, and the scheme of trausportation by water being suggested, we experimented, and decided to put in an ordinary box flume for the purpose. I may say here that our experiments first made were with V boxes. These were found not to work well. The size of flume decided upon was six inches wide by eight inches high, inside measurements, made of two-inch rough lumber, the bottom of boxes being ten inches wide and nailed upon the edges of sides eight inches wide. The fall given our boxes is not less than twelve inches to twelve feet.

Our work since completion and operation has shown that a much smaller box would have been ample for a quantity much in excess of our present requirement, say twenty tons per day. With one inch or one and a quarter inches of water in depth in our boxes we send down to mill thirty tons in ten hours, and I am satisfied that we could, with a little more water, convey twenty tons or more per hour. The boxes are laid end to end and short turns avoided. The lumber was not even planed, and in a week's time no one could have told whether they had ever been surfaced or not. It is too soon after beginning work to say just how much the wear will be, but so far, where the fall is not over one inch to the foot, the wear is not much, but it increases rapidly as the boxes become steeper. I do not think the wear will make the transportation of ore cost us to exceed five cents per ton. There is absolutely no expense except the wear of boxes. I believe that by putting sheet iron on bottoms of boxes and using plenty of water the same results could be obtained with a fall of one-half inch to the foot.

Of course our rock-breaker is located at the mine—where all rock-breakers ought to be—run by water power, the same water afterward carrying the ore to mill. We have a Gates' breaker, so that our ore is broken into small pieces and as nearly cubical as possible. The entire cost of this flume has not exceeded $1200.

As complementary to this method of ore transportation, which I may say is as feasible for long as for short distances, I will briefly indicate how the ore is handled at the mill. We have two water-tight ore bins, with chutes leading into hoppers of self-feeders, these chutes being fitted with plain wooden caps over ends, made water-tight with rubber gasket, etc. After one bin is filled and drained off we begin on that ore, and before that is exhausted our other bin can be filled.

During the process of filling the water runs off through an overflow box, and by this overflow all the debris, such as chips, fuse, candle droppings, etc., besides much valueless slum—with us principally graphite—are carried off. Thus we have a much cleaner ore to run through our batteries and over our concentrators, and can do more and better work in both as a consequence.

If any of your readers will describe a better or more economical scheme I should be pleased to have them do so. Any questions from mining men will be cheerfully answered. N. S. TROWBRIDGE,

Sup't Bald Eagle M. Co.

Sandford Cove, Alaska, June 24, '95.

Colorado's Mine Commission.

The State Commission of Mines has got fairly into harness, says the Denver *Republican*, and the defects in the Newman act creating the office are becoming apparent. Owing to the courtesy of mine owners, the department is being enabled to collect statistics, but only through courtesy. Where an obstinate section is run up against and facts are withheld from the deputy inspectors, down goes a blank and a complete report is rendered entirely impossible. Under the old act there was a Metalliferous Mines Inspector, and the new act contains precisely the same provision. This end of the act is working all right, and the commissioner already has done a lot of good work. He has closed down several dangerous mines, caused a number of others to timber, ventilate and otherwise improve their properties, and made over 200 suggestions to mine operators, which will be enforced. Apart from this, the bill is proving to be the humbug that it was at first declared it would be. The collection of specimens which it was promised the State would be able to get together is slow in materializing. Commissioner Lee has secured some, but they are commonplace. There are eighty-seven professional collectors in this State, every one of whom is willing to pay a high price for valuable specimens. The idea that there would be a procession of express wagons going to the capitol every day loaded with rich specimens has gone glimmering. "It takes hard money to get such specimens as I would like," Commissioner Lee says, and related an instauce.

"I ran across one that I knew would be of value to the State and tried to buy it. I offered the miner $9 a pound for it, which would have come to about $13. He said he would go and get it weighed, and while he was weighing it a collector offered him $25. He then decided he had a good thing and put it in a window for offers. The next was $75 flat, and the last I heard of it was he had been offered $200 and refused to take it."

The commissioner is sure he will be able to get many specimens from personal friends, but the predictions that the collection would not be an important one will unquestionably be borne out for just such reasons as the commissioner has stated,

When a workman is killed in a coal mine, it is the duty of the inspector, under the law, to at once visit the mine, note the cause of the accident, make a report and declare the man dead. Beyond this the inspector has uo authority whatever. The consequence of this is that it costs Colorado from $5 to $70 to declare dead every workman killed in a mine in the State, depending on how many miles at ten cents a mile the inspector has to travel. This condition of things led to a good deal of discussion in the last Legislature, but there is in the new Metalliferous Mines bill an exactly similar clause, commanding the inspectors to at once go to the scene of each fatal accident, which occasions a loss of time, expense and results in no good whatever that could not be accomplished in the ordinary method of investigating violent deaths, particularly where men are killed from such apparent causes as falling down a shaft.

Coast Industrial Notes.

—Seven ostrich farmers in southern California have sold $90,000 worth of feathers during the last year.

—The Crescent City Lumher Co. has a contract for 100,000 railroad ties for the Alameda and San Joaquin road.

—The Clatsop mill at Astoria, Or., has over 100 men employed. Ninety thousand feet of lumber per day is being sawed.

—On her next trip from San Francisco to Cook's Inlet, Alaska, the hark Theobald will carry a complete coal mining outfit and twenty miners.

—The steamer Washtenaw arrived in San Francisco last Sunday with a cargo of rails from New York for the San Francisco and San Joaquin Valley Railroad.

—The Columbia river salmon pack is reported in the usual state of collapse; still, at the close of the season, the aggregate will prohahly he ahout as in former years.

—The Harhor Commissioners last Thursday gave the contract for supplying the tugs, dredgers and pile-drivers with coal to the Black Diamond Coal Company at $5.30 a long ton.

—The receipts of coal at this port for the first six months of '95 were 658,400 tons; for the corresponding period of '94, 621,000 tons. Coal was never cheaper in California than at present.

—In the city limits of Los Angeles, T. B. Flint has put a well down through the deepest sand that oil has heretofore heen found in, and down to the next sand, ahout 200 feet below, where he found oil of 38° gravity.

—The Waters-Pierce Oil Co. has been operating in Mexico nine years. In the district comprising the west coast of Mexico they sold twenty-four carloads of oil the first year. Last year their sales in the same district aggregated 175 cars.

—In addition to recent extensive improvements, the Government has decided to make additional improvements at the Presidio. Besides erecting thirty-five brick and stone structures, new roads will he laid out. The work will involve an expenditure of over $500,000.

—The Nevada County Electric Power Company will have access to 6000 inches of water. Ahout 1000 M. feet of lumher is now being used in huilding flumes, etc. The two 400-horse power dynamos will be shipped on the 15th. The company expects to have everything in successful operation by the middle of September.

—The Sonoma, Mendocino and Humholdt Ry. Co. has incorporated; capital stock $6,250,000, of which $250,000 is subscribed. The proposition is to build from Healdsburg to Eureka, with a branch from Fort Bragg to the Round Valley coal fields. Chicago and New York men are said to he interested, and surveyors are in the field.

—The deal for the transfer of the Northern Pacific railroad to the Great Northern has been definitely declared off. The remarkable improvement in the net earnings of the Northern Pacific made it practically impossihle to carry out the plan to turn the road over to the Hill interests. An official of the Northern Pacific says the road has earned $6,000,000, and there was good promise for $7,000,000 for the ensuing year.

—A very large deposit of marhle has heen found in Pima county, Arizona, ahout ten miles from the Southern Pacific Railroad and thirty miles from Tucson, on George Stone's ranch, near the old Blue Jay mine. Cliffs of pure marhle stand hundreds of feet high and thousands of feet long, and apparently without a hreak. This marhle is white, hlack and variegated, is of fine grain and susceptible of a high polish.

—The oldest olive tree in the United States is at the Mission of San Juan Capistrano in San Diego county. The seed of this tree was hrought from Barcelona, Spain, 126 years ago. The purpose of the Franciscan friars in planting olive trees in southern California was to provide food for the priests who came from the olive-growing districts of Europe. This veteran olive tree is fifty feet high, with a trunk five feet in diameter. Since the first planting of olive trees in California the industry has extended so that it to-day embraces 700,000 trees, of which 400,000 were planted in 1893. Six years ago there were only 700 acres of olive groves in California. To-day there are 21,000 acres, 5000 of which are in bearing.

—In ahout a month one of the largest hlasts ever fired in California will be exploded at the Otay dam, where a granite cliff over 100 feet high and several hundred feet long will he removed hy five tons of giant powder. Workmen are sinking a shaft eighty feet deep 100 feet hack from the face of the cliff. At the hottom of the shaft tunnels will be run the required length, the powder planted and fired hy electricity.

—From a source deemed reliahle it is learned that the Cuyamaca and Eastern railroad in San Diego Co. has been secured hy the Southern Pacific. The plans, so far as ascertained, are that the Cuyamaca will he made the terminus of the Southern Pacific in San Diego city, the road traversing the most fertile portions of the county. The point of connection with the Southern Pacific system is not yet known, whether the line will extend southward from Tustin or from Riverside.

—The importance of the China and Japan trade, and the immense amount of money it annually hrings into the country, is shown by the value of the cargo of the last Northern Pacific steamer, the Tacoma. The value of the dutiahle merchandise which passed through Tacoma to its various destinations was $290,084, while the goods consigned to parties in that city, upon which duty will he paid, was $129,875.84. The total value of the cargo upon which duty is collectahle was $419,-959.84.

—A big $30,000 dredger is being finished at Hay & Wrights yard, in Alameda, for use on the San Joaquin levees. The hucket weighs five and a half tons; the flexihle steel cables have each a tensile strength of sixty tons; the hoom on which the bucket swings is 20 inches square, 130 feet long, and was hewn out of one piece of timher. It has a 400-foot swing and will work in 60 feet of water. The dredger is 110 feet over all, 50 feet heam, 10 feet deep. Its capacity is calculated at 4000 yards per day.

—A scow, designed for saving gold from river-bottom sand, left her moorings at the foot of Folsom street on the afternoon of the 11th inst. for work on the American river. The scow is 60 feet in length, 14 feet heam and is fitted with a 20-H. P. stationary engine, one of the Krogh Manufacturing Co.'s No. 2¼ centrifugal dredging pumps, two Gold King amalgamators, manufactured by the Midas Gold Saving Machinery Co., two screens and shakers, pipe, shafting, pulleys, etc. The idea is to pump the sand from the river hottom, run it over the shakers and screens, getting rid of the coarse gravel, and then passing it through the amalgamators. The plant is to he operated hy two men and can handle about 100 tons of material in a shift of 12 hours. The enterprise is in the hands of the Mendota Gravel Mining Co.

—The Tehuantepec railroad is an important factor in isthmusian transportation. Transportation from San Francisco hy fast freight line to New York via Southern Pacific to New Orleans, and thence by water to New York, covering a distance of about 4600 miles, is accomplished in fourteen days. It takes 140 days to cover by sail the distance of 15,420 miles around Cape Horn, 60 days hy steam along a route of 13,000 miles via the Straits of Magellan, 25 days via transcontinental line, fast freight, over a distance of 3300 miles, and only 20 days via the Tehuantepec railroad, a distance of 4280 miles. A comparison in respect to time and distance of all-rail routes with the half rail and half ocean routes via New Orleans at once demonstrates the importance of this new Tehuantepec route as a competitor for a large class of traffic, and suggests why the Southern Pacific and Morgan line via New Orleans have heen ahle to obtain from 75 to 90 per cent of the entire transcontinental traffic and dictate their own terms to competing lines.

—When the Folsom electrical transmission scheme is an assured fact, the American River Land and Lumher Co., of which A. J. Ralston is president, will huild a lumher mill at Folsom, to have a capacity of 20,000 M. feet annually, and be run hy electricity. The logs are to he cut on the upper Georgetown divide, fourteen miles northeast of Placerville. They are to he carried thence hy a logging railroad ten miles long to the south fork of the American river, where they will he rolled off the cars into a log chute 3000 feet long, with a fall of 1100 feet, down to the river. This chute is large enough to take logs seven feet in diameter. Thence they drop into a log basin, the back water from the dam, forty feet high, hacking the water for a mile to the depth of thirty feet, from whence the logs are driven down the river forty miles to the hoom in the slack water just ahove the Folsom dam. The company has finished the first log drive of 5000 logs, which are now in the boom, whence they are floated down the canal of the Folsom Water Power Company to the mill in Folsom. The logs in the basin are mostly sugar pine and yellow pine, ranging in diameter from twenty-four inches to six and a half feet. This logging plant is the only one in the interior of the State that hrings the timber line close to tide water.

Books Received.

"*Prospecting for Gold and Silver*," hy Arthur Lakes, Golden City, Colorado, is a book of 207 pages, intended for the prospector and miner. Though largely made up of the writer's Colorado experience and observation there is a great deal of practical value to the prospector anywhere and much that is ahsolutely necessary for the unseasoned prospector to know. The hest thing ahout the book is the way it is written; the author is not trying to show how much he knows, hut uses little words and a homely style, making its contents interesting and of practical value. No matter how old or experienced a prospector may he he can get a good many pointers from this hook, and the heginner will find it exceedingly useful. It has ninety-eight illustrations and will be mailed to any part of the world by the puhlishers, the Colliery Engineer Co., Scranton, Pennsylvania, on receipt of the price, $1.

Lead Ore Importations.

Lead ores were imported during the fiscal year just closed at the following ports, as annexed:

Customs Districts.	*Pounds Lead.*
Arizona (Nogales)	1,211,079
Corpus Christi, Texas	1,872,599
Montana and Idaho	336,305
North and South Dakota	20,494
Paso del Norte	41,325,012
Puget Sound, Washington	3,347,017
Saluria, Texas	1,348,672
San Francisco	1,514,406

AT the Mansfield copper mines in Germany, reservoirs for compressed air are cut out of the rock, near the machinery to be operated thereby, and lined with cement. There are eight of these receivers, from 1235 to 3950 cubic feet capacity. A rock chamber of 2200 cubic feet capacity costs, it is stated, only one-third as much as an iron receiver of equal size.—Denver Mining Review.

Mechanical Progress.

The Inertia Governor.*

By Prof. John E. Sweet.

I sball show you that the first of these engines built with a shaft governor embraced the idea of the inertia principle, which has become a fashionable hobby, and I think, if you will give me your careful attention, I can show by tbe simple use of the English language and your reasoning powers there is no possibility of the inertia element being applied to a shaft governor beneficially except as a dash-pot, and to call the thing by its right name is to call it an inertia dasb-pot ratber than an inertia governor.

First allow me to direct your attention particularly to the fact you all well know—that tbe fly-wbeel of an engine receives its impulse intermittently, receiving nonc at tbe commencement of the stroke, a maximum at about the middle of the stroke, and none at the completion of the stroke. The mean in work of tbe successive impulses is (aside from friction) that given off by tbe belt, which is ordinarily pretty nearly uniform, and probably from 60 to 75 per cent of tbc maximum impulse. Now please bold tbis idea firm in your mind, that the power tending to disturb the uniform motion of the fly-wheel is about tbe greatest possible at each half revolution.

The claim made for tbe inertia governor is this: If tbe load is instantly removed from the engine, the surging ahead of the fly-wheel will, as it exceeds tbe uniform motion of the inertia weight, sbift the cccentric and cause an instantaneous, complete or partial cut-off to take place; or, if an excessive load is thrown on the engine, that tbe retarding of the wbeel will prolong the cut-off. From this reasoning it will be seen that the disturbing element tending to vary the cut-off is only from mean load to light load, or usually not one-half tbe disturbing element that obtains at every balf revolution of the engine from tbe piston; or, in the other case, if a full load be thrown on, it is only from mean to maximum, again not half the disturbing element that obtains from tbe piston at eacb half turn of the engine.

Further, let us assume that the fly-wheel is so light, and the acceleration or retardatiou be so much that it will over-run or under-run the inertia weigbt, tben the surging abead of the fly-wbeel will be so great at eacb balf turn as to render tbe engine unacceptahle.

Again, let it be claimed tbat the inertia governor is not expected to act instantaneously, but only to act by such acceleration or retardation as may take placc in two, three or four revolutions. I can only reply to that by saying that two, tbree or four revolutions is not half as quick as the centrifugal governor will act. Nothing is said by the champions of the inertia governor about variation in steam pressure. Of course, it is hardly necessary for me to call your attention to the fact that the inertia element in a governor has no influence wbatever towards correcting variations in speeds due to variation in steam pressure; and to meet this difficulty, which may be as troublesome as variation in load, the cngine must have an additional governor of some sort to meet this condition. When such a governor is supplied, it may be as able to meet variation in load as steam pressure.

Where there is friction on the valve or on the rod, tbe force to overcome this recoils on the governor (unless friction or a wedge is interposed to prevent it), and this tends to tbrow the ball in and out. Here the inertia dash-pot may become useful.

I hope to be able to show you copies of cards taken from an engine running under full load, and the load instantly removed, the indicator pencil being held on both before and after the change, to show what can be done by a centrifugal governor.

When one once realizes that, in the engine from wbich tbese cards are taken (the valve of whicb bas a maximum travel of four inches), the throw of tbe eccentric only has to change five-sixteenths of an inch to make the difference from cutting off at balf stroke to no load, and that tbe governor ball only has to change from a circular patb of about 14 inches radius to one of 14⅛ inches, it at once places the matter in wbat will no doubt appear to you a new light, and, *what is a fact*, will be readily perccived tbat witb a frictionless governor *the ball is just as ready to find its new path as the fly-wheel is its new velocity.*

In the first sbaft governor employed, not only with this enginc, but in nearly all of the early experimental governors of this class, Woodbury's and Wilson's among others, tbe notion prevailed that if the governor balls were located and pivoted so that, as the fly-wbeel surged abead, it would tend to swing tbe ball out, or, if slowed down, the momentum of the ball would naturally swing in, the governor would bc all the more prompt to act. In tbis case it was so hung that the distance tbrough space tbe ball would have to travel, from its inner patb to half cut-off in one revolution, was tbe same as if it continued in its upper positiou; or if in its outer position, or at balf stroke cut-off, it would have practically tbe same travel througb space whether it continued on in its outer path or shifted in in one revolution, and tbis was, I fancy, about as good an arrangement to make a worthless governor as one could devise. By turning tbe governor the otber end to, and making the path, tbe governor ball has to travel in one revolution about one per cent greater than the normal path in eitber case, the governor weight is given a degree of stability which tbe cards show is all that can be desired hoth in sensitiveness and stability, where friction in valve and governor mecbanism is reduced to a minimum.

*An address before the students of mechanical engineering at the University of Wisconsin.

American Inventors.

The French Society for the Encouragement of National Industry has published a list of prizes and prize subjects for the year 1896 that may be of interest to American inventors. Tbe grand prize of 12,000 francs, or, say, $2400, will he given tbis year to the author of tbe discovery most useful to French industry. The list for 1896 is very comprebensive, and covers almost every branch of industry. Tbere are sections, each offering a large number of prizes in electrical and mechanical arts, chemical arts, economic arts, and agriculture. In the mechanical arts section there are prizes for tbe best motor fed with some commercial oil; for an engine of from 25 to 100-horse power, using as a maximum when working 7½ kilogrammes of steam per bour, and per indicated horse power; to the manufacturer who first produces, mechanically, linen threads, of wbicb at least 100,000 meters go to one kilogramme, or, in the case of bemp, 15,000 meters per kilogramme; for a method of reducing leakage in marine boilers; for the best memoir on the cost price of the motive power of steam; for a small motor suitable for a home workshop, and whicb will work by the use of some simple power available in the bouse, or hy energy transmitted from a certain station; for improvements in the processes of retting linen and hemp in industrial use. In the chemical art section tbe prizes cover the utilization of waste products; a work or memoir of use to chemical or metallurgical industry; an experimental study of the physical and mechanical properties of one or more metals or alloys in current use; improvement in the production of sulphuric anhydride, chlorine and of cast steel and iron; also, the discovery of a new alloy useful to the arts; of comhustion in furnaces used for the production of ceremic clays and coverings; the substitution of sulphuric acid in dyeing, and especially in silk dyeing, by another compound which will give to the fibers tbe desired stiffness, without exercising any destructive action; and processes capable of yielding, hy certain chemical changes, useful organic products, such as quinine, cane sugar, etc. In the section of economic arts prizes will be given for the invention of a highly efficient petrolcum for lighting, for the discovery of metbods to diminisb the number of chimney fires and their resultant damage, and for an incandescent electric lamp of one-tenth candlepower when a current of .05 ampere is passing through it at a potential of 100 volts. In the agricultural section some of tbe subjects inviting competition are the best varieties of barley for brewing, the re-establishment of vineyards on chalk soil, a new forage plant, study of the culture of wine, and a work on tbc influence of various processes on vinification on the quality of wine.

Scientific Progress.

Improvement of Projectiles.

In an interesting communication to the London *Times*, apropos of tbe approachiug meeting of the Institution of Naval Architects in Paris, a correspondent draws attention to tbe progress which has recently been made in the manufacture of armor plates and guns, and hints that more attention might now be paid to tbe manufacture of projectiles. The improvement in the resisting power of armor which has been brought about during the last seven years is stated to be nearly 50 per cent. At an earlier period, when wrougbt iron was in use, 22-inch armor could have been perforated by the modern 12-inch projectiles, and 19-inch armor by 9.2-inch projectiles. To-day, in plates of average tbicknesses (6 inches to 12 inches), the best projectiles require a diameter nearly equal to the thickness of the plates they are required to perforate. Six-incb plates will resist perforation from a 6-inch projectile fired at 1960 feet velocity per second. A plate 10½ inches tbick has resisted well a 9.2-inch projectile with 1800 feet velocity. Tbis plate has already received five rounds of 6-incb projectiles with velocities of about 2000 feet per second. None of these latter made more than a splash upon the plate. Tbe projectiles go to pieces against tbese new plates. But the newest guns, with modern powder, are quite capable of doubling the energy of the projectile, and it is important to consider whether the projectiles hitberto produced would be capable of using up this energy. No doubt increased velocities migbt secure perforation, althougb tbe punch may go to pieces. It has been found, for example, that projectiles whicb, with 2000 feet velocity, did no serious damage to tbe plate, could be forced through the plate in places when the velocity was raised to 2400 feet per second. "May it not be," he asks, "that, as against the hardened plates, shots whicb will pulverize are less suitable for high velocities than shots made of a more ductile material, which will submit to a moderate flow of tbe steel during the instant tbat perforation is being effected?" It appears to he useless to double the energy upon a punch which goes to pieces with the energy already commonly employed. We need to be reminded that the modern increase in the size of ships of war is largely dependent upon this relative advantage of the armor over the gun. So long as armor is believed to be capahle of resisting perforation, attempts will be made to cover larger portions of the sbips with it, and the larger the ship the more easy it is to cover her sides with armor impenetrable to the average gun. Witb armor in the ascendant, ships will grow in size; with guns in the ascendant, numbers of ships, rather than large ships, will come into favor.

Modern high explosives are again bringing the principle of the old gunpowder engine into prominence. Col. Barker, superintendent of the British Royal Small Arms Factory, at Sparkbrook, in receutly speaking of the subject, made the point that while one pound of gunpowder was capable of developing over 170,000 foot pounds of energy, the new smokeless powders were capable of still more, and, at the same time, left no solid residue as ordinary gunpowder did on combustion. The latter developed in combustion about 280 volumes of permanent gases; the new powders gave off nearly 1000 volumes.

Waterproofing Brick and Sandstone.

At a recent meeting of the Australian Association for the Advancement of Science, Prof. Liversidge read a paper on the "Waterproofing of Brick and Sandstone with Oils." Experiments were made with tbe view of ascertaining the length of time that brick and sandstone are rendered waterproof or protected by oil. The oils used were the three commonest and most readily obtainable for such purposes, viz., linseed oil, boiled linsced, and the crude mineral oil known as "blue oil," used for preserving timber. The weatherings were made upon a flat portion of the laboratory roof fairly exposed to the sun and weather. Good, sound, machine-made bricks were experimented on. The amount of oil and water taken up by the sandstone was very much less than that absorbed by the brick, altbough the area of the saudstone cubes was mucb greater tban that exposed by the bricks. Equal amounts of raw and boiled oil were absorbed; the blue oil, however, was taken up in much greater quantity by botb brick and sandstone, but by the end of twelve months the whole of the 13½ ounces of blue oil had apparently evaporated away and the brick had returned to its original weight. The bricks treated with raw and boiled oils remain unchauged. After the second oiling in November, 1890, and exposure for nearly four years and two months, they had practically retained all their oil, inasmuch as tbey had not lost weight, and were also nearly impervious to water. It was noticeable that the sandstone cuhes treated with raw and boiled oils returned to their origiual weigbts, but do not appear to have lost the beneficial effects of tbe oils, being also practically waterproof.

Testing Lubricating Oils to Detect Gum.

A simple process for this purpose is credited to Nasmyth, aud consists of an iron plate six feet long with grooves planed on the surface and fixed in an inclined position, about one inch in six feet. Into the grooves at the upper end an equal quantity of each oil to be tested is placed, eacb kind in a single groove. The oils start on a race down the incline and if tbe right quantity has been used, about the fourtb or fifth day the gummy oils begin to coagulate and come to a stand, wbile the good oils go on, and at the end of eight or nine days no doubt is left as to which is the best.

A good oil that is known to be satisfactory can he used in one of the grooves as a standard of comparison.

Tbis method of testing has been used at the Stevens Institute of Technology, only in place of the iron plates and grooves a plate of thick glass was used. Tbe plate should be kept covered to exclude dust during the test.—Bell Crank in Machinery.

One of the important changes that is taking placc in engiueering practice is the winding of steam pipes over eight iuches in diamcter with $\frac{3}{16}$-inch copper wire, thus nearly doubling the bursting pressure. That the thickuess of sheet copper forming the pipe may be reduced to the minimum, and at the same time ensuring the full advantage of wire winding, an improved system of manufacturing steam pipes has been devised, which consists in using copper of the thinnest practical gauge to form the interior or core of the pipe, whilc the body proper is composed of steel wire wound closely around the core, the interstices being filled in solid with copper by electro deposition. The increased strength secured by wire winding is fully attested by the results of the wire-wound gun.

Electrical Progress.

Transmission of Energy Over a Single Conductor.

Says Tesla in the *Century:* "In connection with the resonance effects and the problem of transmission of energy over a single conductor, I would say a few words on a subject which constantly fills my thoughts and which concerns the welfare of all. I mean the transmission of intelligible signals, or perhaps, even power, to any distance without the use of wires. I am becoming daily more convinced of the practicability of the scheme; and though I know full well that the majority of scientific men will not believe that such results can be practically and immediately realized, yet I think that all consider the developments of recent years by a number of workers to have been such as to encourage thought and experiment in this direction. My conviction has grown so strong that I no longer look upon this plan of energy or intelligent transmission as a mere theoretical impossibility, but as a serious problem in electrical engineering which must be carried out some day. The idea of transmitting intelligence without wire is the natural outcome of the most recent results in electrical investigations. Some enthusiasts have expressed their belief that telephony to any distance by induction through the air is possible. I cannot stretch my imagination so far; but I do firmly believe that it is practicable to disturb by means of powerful machines the electrostatic condition of the earth, and thus transmit intelligible signals and perhaps power. In fact, what is there against the carrying out of such a scheme? We now know that electric vibration may be transmitted through a single conductor. Why, then, not try to avail ourselves of the earth for this purpose? We need not be frightened by the idea of distance. To the weary wanderer counting the mile posts the earth may appear very large; but to that happiest of all men, the astronomer, who gazes at the heavens, and by their standard judges the magnitude of our globe, it appears very small. And so I think it must seem to the electrician; for when he considers the speed with which an electric disturbance is propelled through the earth, all his ideas of distance must completely vanish. A point of general importance would be first to know what is the capacity of the earth, and what charge does it contain of electricity?"

The Gutta Percha Supply.

Whatever electricity may eventually prove to be, it has some qualities about which there is little doubt. One of these is its readiness to take a short cut, and run to ground at the slightest opportunity, instead of continuing along the conducting wire and finishing the work intended for it. The greatest care has, therefore, to be taken in insulating wire—that is, covering it with some material which is a bad conductor of electricity, and will prevent its escape. As water is sometimes used under very high pressure, so electricity is now employed, especially for transmission over long distances, and with the consequent heavy strain comes the need for insulating material of the highest efficiency. Gutta percha has been one of the insulating mainstays of the electric engineer, but disquieting rumors have been for some time prevalent as to the coming failure of the supply. Mons. Hourant, a French cutch merchant of Sarawak, has discovered that gutta percha can be extracted from the dried leaves of the gutta tree. The old native plan, which threatened to ruin the industry, was to cut down a tree to get the sap. A tree of thirty years of age would give only one catty of pure dry gutta; the same quantity is now obtained from two pluckings of the leaves. These pluckings are said not to injure the tree, which goes on seeding and reproducing its species. The millions of trees already cut down, and apparently destroyed by the native gutta hunters, will now come into service, as their stumps have sprouted out, much as an osier does, and although the shoots are too small to produce gutta, their leaves are as good for the purpose as those of an adult tree.

Electricity by Cloud Formation.

The belief that the formation of cloud is often accompanied by electrical effects is confirmed by Professor Schuster, who describes an experience in Switzerland. As he was descending from Dent Blanche after sunset, he found himself in a wide valley at a height of about 12,000 feet. A current of air was apparently blowing up the valley, and below him he observed the formation of a cloud at a height a little below the snow line. As night came on, and the descent over the glacier and down the valley was continued, a series of electric discharges were seen between the cloud, which was lying in a deep-cut valley, the sides of the mountain, and the blue sky overhead. The moist air was evidently flowing through the cloud, depositing its moisture in the form of drops, and leaving the cloud in an electrified state. Wherever water rubs against air, positive electricity is generated. Every wave that breaks into spray under the action of a strong wind leaves the water negatively electrified, the air carrying away the positive charge. Professor Schuster suggests that it would be of great interest to possess observations on atmospheric electricity on board ship while waves are breaking in the neighborhood. So far we have to guide us only the observations of Exner, who found on the Ceylon coast that the spray from breaking waves showed by the electrometer that it was positively electrified.

Studying the Arc Lamp's Light.

Lecturing recently on the arc lamp, Professor Sylvanus P. Thompson, F. R. S., said that most of the total light of an arc lamp is given off from the crater, less than ten per cent coming from the peak. The crater may be regarded as a flat, self-luminous area. If it could be seen in such a way that the peak never came between it and the eye it would give the greatest light when looked at perpendicularly and the least when the line of vision was horizontal with its surface. But the shadow of the peak has to be reckoned with, and it is found that the light given off is directly proportional to the area of crater actually exposed to view, being greatest at an angle of 40 degrees or 50 degrees. In the middle of the crater there may sometimes be discovered with the unaided eye a nebulous patch rather whiter than the rest, which seems to be in motion. By the use of appropriate artificial means this patch may be seen as a comma-shaped object which rotates round the crater at varying speeds, and not always in the same direction. It is a question whether this is a true physical rotation of the flame or only an optical effect.

DETROIT, MICH., is giving a franchise to the Harrison Telephone Company, fixing the rates a $25 a year for private residences, $40 for professional men, and $50 for business houses.

A CONSERVATIVE ESTIMATE places the daily consumption of incandescent lamps in the United States at 35,000.

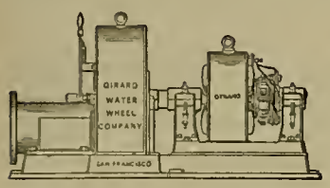
The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.



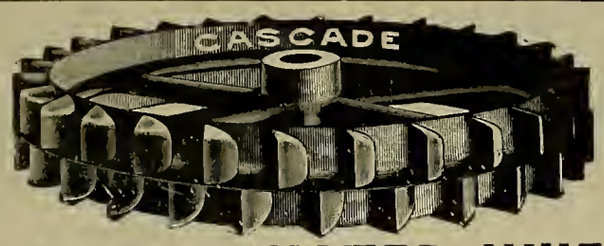
PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon applicatinn. Address

THE PELTON WATER WHEEL CO.,

121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Girard Water Wheel Co.,

34 MAIN STREET, - - SAN FRANCISCO, CAL., U. S. A.

WATER

WHEEL

CASCADE WATER WHEEL

Adapted to all heads, from **30 FEET TO 2000 FEET.** Our experience of **33 YEARS** in the water wheel business enables us to suit every requirement of water power plants. Send for illustrated pamphlet. This new wheel has given an unequaled Economy in Water.

JAMES LEFFEL & CO. Springfield, Ohio, U.S.A.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon applicatinn.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.

COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.

COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,

SACRAMENTO, CAL.

Mining Summary.

CALIFORNIA.

Amador.

MIDDLE BAR.—*Dispatch*: The Montana mine is being opened up, the shaft is sixty feet deep.

At the Hancock mine, below the Montana mine, a tunnel is being run in by the Summers brothers.

SUTTER DISTRICT.—*Ledger*: A contract has been let by the South Eureka Mining Company to take down and reconstruct the old Downs' mill. It is to be hauled from its present location near Volcano, and is to be completed by the 1st of October.

JACKSON DISTRICT.—Superintendent Jas. E. Dye will commence operations on the Amador Queen mine next week.

SUSPENDED.—*Republican*: The operations at the Pioneer mine, near Plymouth, came to a standstill last Sunday. The mine is owned and has been worked by Dr. Boyson, who is the largest stockholder in the Kennedy. The doctor has invested considerable money in mining enterprises around Plymouth. For the last three months or more it is believed that this property has paid handsomely, the yield, we are informed, averaging somewhere about $12 per ton. They have been operating on the 400 level—the deepest in the mine. The ore body at this depth was worked out. Sinking, involving an additional expenditure of money which the doctor deemed inadvisable to undertake alone, became inevitable. He therefore determined to shut down until he interested other parties in the property. It is the prevailing opinion that the Pioneer will then turn out a fine paying mine.

AMADOR GOLD MINE.—There is some prospect of the early resumption of work by the reorganized company owning this mine under the name of Jackson Gold Fields. A deed was put on record this week conveying the title of A. S. Cochrane in the Amador Queen mines and mill to the company, and it is the intention to start work on the Amador Queen No. 1 as soon as possible. It may be mentioned that the old-standing indebtedness of the Amador Gold Mine to the Pacific Bank was settled last week. The total indebtedness was about $22,000. A compromise was effected by the payment of $15,000. The company has also sent word that it stands ready to settle any other legal claims against it.

Butte.

GENERAL NOTES—*Mercury*: At Forbestown a 1200-foot tunnel is being driven to tap the Gold Bank ledge 2400 feet below the surface. The tunnel is now in 800 feet.

At Oregon City extensive mining developments have lately been made in the Mascot and Standard mines, and the Louisiana and Rock River mines will be worked soon.

It is reported that a thirty-stamp mill be erected shortly on the Golden Summit mine.

A 800-foot tunnel is being driven into the Golden Butterfly, 250 feet of which is now in.

At the Magnolia a 500-foot shaft is being dug, which has already reached a depth of 260 feet.

A new quartz mill is to be built near Merrimac.

The recent rain was of sufficient quantity to cause the river to rise so that the canal at the Golden Feather cannot carry all the water. Hence operations at the mine will be delayed for awhile.

A report from Wyman's ravine says that Snyder, Rouse & McDonald have struck rich gravel.

Work on the Matti mine will be commenced in a few days.

Calaveras.

MINE BONDED. — *Citizen*: Jerkins and Wheelock have bonded the Eureka quartz mining claim, Cave City mining district, to P. H. Kean. It is understood that the bond of the mining property was made in the interest of Denver, Colorado, parties. The ledge is over three feet in width in the shaft and exhibits gold and very rich sulphurets.

THE SMADEKE MINE.—At the Smadeke mine the shaft is 280 feet deep. Ore assays $45 taken from the bottom. The gold is largely free milling; the sulphurets, of which it carries about three per cent, consist of arsenical pyrites, magnetic oxide of iron and petzite.

El Dorado.

GENERAL NOTES.—John Melton has four men at work on the Eagle King. T. H. Bradley is reopening the old Eagle mine. The Last Chance and Mt. Pleasant will soon resume. At the Daily mine Supt. Baughman is about to put up a ten stamp mill.

Inyo.

THE HIRSCH MINE.—Sup't Rives is pushing work at the Hirsch mine. Men are grading and lumber is on the ground for the tramway, etc.

Kern.

AMALIE MINING DISTRICT. — The Amalie Mining Company have put in a compartment shaft and ordered a new six-horse power gasoline hoist to take the place of the one now in use, it being too small to raise the large amount of ore that is being taken out. In widening the shaft four feet for 100 feet in depth they took out fifty sacks of shipping ore. This company also struck a new shoot of rich ore in tunnel No. 2, winze No. 3. While sinking and following a two-inch streak and breaking the hanging wall only when at a depth of sixty feet and preparing to do some drifting, a set of shots were put into the footwall to give sufficient room. After these shots were fired it was found that there was a thin streak of waste on what was supposed to be the footwall, and behind this was a three-foot ledge of high-grade shipping ore. This ledge has been sunk in on four different places by the Amalie Company, showing fine shipping ore in each place. From each of these shafts or winzes there have been drifts run from 50 to 100 feet each way. The Occidental Company have also sunk in two different places on the same lead, both shafts showing good ore. These six different workings cover a distance of 800 feet on the lead.

The Dull Bros. have made a remarkable strike in the Mayflower, with an eight-foot lead of milling and a small streak of shipping ore.

A. Sauser has located a lead carrying both gold and silver, and, it is said, has bonded it to some Colorado men. G. E. F.

Mariposa.

THE MAXWELL MINE.—*Gazette*: J. N. Cathey, who recently sold his mine below Benton Mills to the California Mines Company, has bought a one-half interest in Maxwell's mine in the same neighborhood.

Nevada.

GOOD PROSPECTS.—*Tidings*: The North Star Mining Company in blasting out the foundation for their new power, found numerous clay seams through the rock and were compelled to put in a stone foundation. Their intention is to have 250-horse power from the pipes and water supply. They can duplicate the compressor and get 600 additional horse power from the same water plant and existing pipes. This plant is to work Massachusetts Hill and other properties belonging to that company.

A MINE BONDED.—*Union*: The Plumbago mine, near Moore's Flat, has been bonded to Col. Taylor for $20,000. A payment has already been made on the property. It is owned by Chas. Haggerty and has produced some fine rock in times past. Work is carried on by the tunnel process. Mr. Taylor contemplates erecting a ten-stamp mill on the mine.

THE LAST CHANCE.—Some Sacramentans recently purchased the Last Chance quartz claim from the Yuba Mining Company, paying for it $1,500. The mine is located on the South Yuba river above Washington. The *Herald* learns that the new company is now running a tunnel on the claim, and they are taking out some fine-looking rock.

Placer.

THE PEDLAR MINE.—*Sentinel*: The Pedlar mine at Eucbre Bar is being worked by a company of capitalists of whom Senator Geo. C. Perkins is at the head. The mine is on the north side of the river opposite the Ford & Bentley property. The ledge is 2½ feet thick and lies in a slate formation. There are two tunnels—500 and 100 feet—which will be driven ahead.

THE HOBO MINE.—The Hobo mine at Shady Run is located near the old Harvey mine on the white gravel lead. A main tunnel is driven over 1200 feet, opening up good-looking gravel.

THE FOSS MINE.—The Foss mine at Lowell Hill is at present working eight men under the management of G. K. Wood. The gravel in this mine is also of the white lead. The tunnel is in about 2000 feet and has considerable ground opened up ready for drifting.

THE ALTA.—At the Alta mine the water has been pumped out of the old mine and at present air pipes are being placed in the old works; and if the condition of the old works will permit, a tunnel will be started to meet the main tunnel which is now being run. The main tunnel is now in about 1800 feet, and it will be several weeks yet before the old works will be reached. Some very good gravel has been found in the main tunnel. Wm. Doolittle has charge of the work.

Riverside.

TEMESCAL TIN MINES.—The English owners of the Temescal tin mines are thoroughly prospecting their property with a view of establishing reduction works sufficient tin ore can be found to warrant the expenditure. A number of shafts have been sunk and other holes will be made in the course of development. It would not be at all surprising if there were some gold mines unearthed in this search. The work is under the supervision of H. B. Varcoe.

TWENTY-NINE PALM DISTRICT.—The Virginia Dale gold property in the Twenty-nine Palm district has been bought by Eastern men. The purchasers will put in a ten-stamp mill and develop the mine.

San Bernardino.

THE LOST HORSE.—The Lost Horse mine, forty miles east of Banning, is down 120 feet at which is two and a half feet of ore. Levels were run at 100 feet and sinking will go on until the 200-foot level is reached. At present a two-stamp mill is run, operated by a gasoline engine. It is the intention of the owners to put in a five-stamp mill as soon as the main body of ore is reached.

San Diego.

RENEWED ACTIVITY.—*Union*: Gold is coming from the Banner and Julian districts. Assayer Aubury has two bars of bullion aggregating over $2,100, from the Elebada mine near Banner, the product of ore taken out in sinking a fifty-foot shaft. The ore is very regular in character and the vein shows no indication of being "pockety." The shaft will be continued down to the 100 foot level before drifting is commenced.

The Ready Relief mill at Banner, last week crushed nineteen tons of ore from the Ranchito mine.

A project is on foot to open up the old Mission mine, sixteen miles from this city. Every evidence goes to show that at some time this body of quartz was worked by the Indians. A large dump of broken quartz is to be seen, but so far no openings or workings have been found.

A. G. Adams left for the desert country on Wednesday last, to inspect and open up a number of gold properties near Picacho. H. Harrison and Mr. Curtis are doing some prospecting near the Colorado river, above Yuma, and are meeting with fair success. R. S. Dunlap was in from Dos Palmas last week with samples of ore for assay from a large ledge of galena, which he is opening up.

T. V. James, A. D. Richmond and Harvey Carr, Chicago capitalists, will leave for Pine Valley on Tuesday and after inspecting the mineral resources there will continue overland into Lower California. The Cortelyou mill at Pine valley has been grinding ore from the Hawkes Bros.' mines on Indian creek. The results are very satisfactory.

Shasta.

TO BEGIN WORK.—*Democrat*: C. A. Hascall will commence operations on a large scale on his Mule mountain and Salt creek properties in a few days. Mr. Hascall represents eastern capital. The object of this syndicate is to sink on their mines for the purpose of thoroughly developing them and then to put up a plant that will successfully work the ores and save all the gold contained in the basest of it.

The Shasta County Development and Mining Company will follow about the same course and will do some extensive development work in a very short time.

AN ANCIENT CHANNEL.—The *Searchlight* says on Dog creek, near Delta, a channel makes its appearance on the east side of the Trinity range above the head of Chase gulch, continuing southeasterly to a point known as Old Diggings, on Dog creek, where it made a large spill of gold and on its way to this point feeding Chase and McCall gulches. From Old Diggings it runs parallel with the present Dog creek and makes very few spills to its point of outlet. The system consists of a lava capped channel underneath which lies blue gravel and that is to be developed.

Sonoma.

QUARTZ AND PLACER GOLD.—R. G. Burton is credited with the discovery of a vein of gold-bearing quartz, in Dry Creek valley, ten miles northwest of Healdsburg, and placer gold taken from the sands close by. The usual "excitement" is reported.

Trinity.

AT THE BROWN BEAR.—Chas. Dobler, superintendent Brown Bear mine, has completed a tank above the mine which holds 15,000 gallons. There are 1400 feet of two-inch pipe laid from this tank in separate lines, which cover the mill, houses, etc., under a pressure of 100 feet.

AT TAYLOR'S FLAT.—*Journal*: Pelletreau and Hedges have struck gravel diggings on the bench of the river opposite Taylor's Flat.

Mr. Finch, of Sacramento, has an agreement of sale upon and has taken possession of Canadian Bar, which has been lying idle for some time.

At the Don Jaun mine W. A. Huestis, Moody & McIntosh, have cleaned up $575 from 109 hours run of 200 inches of water. They worked 1906 yards of bed rock.

There are more prospectors along the river than for many years and a good deal of work is being done. It is reported that the Trinity River Tunnel and Mining Company will resume operations at Taylor's Flat this fall.

OPERATIONS AT MINERSVILLE.—The *Record* is informed that the French company now operating on the old Deiner property, has sluiced off several acres of ground and expect to clean up forty or fifty thousand dollars. They have forbidden the men to walk over the bedrock unnecessarily. The *Record's* informant says that he could go into their ditch and get out a hundred and fifty dollars to the pan almost anywhere in the ditch. The Count de Kergoley is in charge.

NEW RIVER NOTES.—The Sherwood mine, because of litigation, is idle at present.

A San Francisco company has recently bonded the Hoboken Flat property belonging to Moses Patterson on lower New River, and have half a dozen men at work opening it up.

There are about a dozen men prospecting along Pony creek. A couple of them took out two nuggets one day last week which weighed $57.

U. G. Day, superintendent of the Enterprise mine, on the East Fork of the North Fork, has a bar of gold weighing 120 57-100 ounces, the result of a run of about 140 tons of quartz. He reports that they are now taking out forty dollar rock.

Tuolumne.

WIDE WEST MINE.—The Wide West, on Burro creek, is being examined by experts who represent a mining syndicate that have in view its purchase should it be favorably reported. It is a property that has been formerly worked and abandoned through the inability of incompetent management and the use of ancient appliances. The ledge is three feet in width incased in footwall of slate with a sandstone for the hanging wall. A five-stamp mill is on the ground. A tunnel of seventy-five feet in length crosscuts the ledge at which point stoping began.

NEVADA.

THE BRUNSWICK LODE.—The Brunswick lode, the present scene of operations by the combined Comstock companies, lies about 7000 feet east of the main Comstock lode. It is a vein of unusual size, averaging 100 feet in width, and is traceable on the surface by croppings for 14,000 feet. At several points openings have been made in times past in chimneys of ore that showed on the surface, and from some of these gold and silver have been extracted.

Beside the Occidental the only work of any extent is at the north end, in the Monte Cristo mine, where paying ore was extracted to the depth of 150 feet, when a flood of water prevented further sinking. At the St. John's mine, the Bailey, Alabama and half a dozen others, a considerable amount of surface gouging has been done, and from the first two a considerable amount of money was taken out at various times by parties who leased the ground. At most of the mines there was trouble with water, and the short cuts and tunnels run were of little value as drains. At all the points where work was done in the early days ore was found which should pay at present with the improved facilities for mining and milling. The Brunswick lode was tapped by the Sutro tunnel at a depth of a little over 1300 feet. This gives drainage and affords facilities for prospecting and ore extraction. As in working upward all ore and waste will descend to the tunnel level by force of gravity, raises and other openings may be made at small cost.

The ore of the lode yields about equal amounts of gold and silver, and is of a character not difficult to work. Milling can be done by water power, and, if required, water can be taken to the lode and used anywhere above the tunnel level for driving machinery.

Esmeralda County.

FIRST PAYMENT MADE.—The owners of the Silver Star group of mines are said to have received a first payment of $100,000 from Senator Wolcott, who has bought the mines. The whole amount to be paid is not known. It is understood that the mills will be built.

James O'Hale is putting up a cyanide plant to work the tailings from his mill in the southern part of the county. The tailings are worth about $12 per ton, and he expects to realize from $10,000 to $20,000 on the lot.

OREGON.

A LONG TUNNEL.—*Democrat*: The management of the Union and Companion mines at Cornuopia have decided upon running a tunnel 1,000 feet in length, and other work is contemplated by which these mines will be put under a complete state of development before a reduction plant is erected.

IN SOUTHERN OREGON.—*Tidings*: A run of three cars of ore from the Homestake mine, near Woodville, yielded $350, about the same as from that previously milled.

W. L. Chapman & Co., of Portland have men building a wing dam in Rogue river, one-half mile above Gold Hill.

Campbell & Co., of Portland, have bought the Hamalin claim on Rogue river, fifteen miles below Gold Hill, and have men building a reservoir for hydraulic purposes.

THE TOLO MINING CO.—The carload of ore shipped by the Tolo Mining Co. to the Ashland Mining Co.'s mill resulted favorably, averaging $35 to the ton. There is considerable more of the same kind in sight.

BRITISH COLUMBIA.

AROUND NEW DENVER.—Two more tunnels are to be run on the Ruth. This mine made a shipment recently of twenty-eight tons, two of which were carbonates. This property is across the gulch from the Slocan Star.

The Slocan Star has commenced shipping again, six teams being employed in transporting the ore to Three Forks.

Yanill Bros. have bonded the Black Fox and Daisy to Porter Bros., the railway contractors, for $15,000. One thousand dollars was paid down and the other payments will extend over a year. These claims are on the south fork of Kaslo creek and are about five miles from the railroad now building. A well defined ledge, twelve feet in width, can be traced through both claims, and the assessment work has shown up two feet of clean ore. Several men will be put on this summer and the ore packed over the trail for shipment by rail to Kaslo.

An average of twenty claims a week are being recorded at New Denver. Many of these locations are at the foot of Slocan lake and are rich in gold as well as silver.

The prospectors owning claims on the Galena farm have built a trail seven miles in length from their properties to Scherlon. The trail also taps the claims on Eight Mile creek.

The New Columbia and Cordelia, two North Fork properties, have been bonded to a company of Canadian Pacific officials.

ON CRAWFORD CREEK.—The owners of the Silver Boy and Humboldt mines on Crawford creek have been offered $40,000 for a bond on the property. The property assays 70 ozs. in silver and 60 per cent lead.

ALASKA.

REPORTED FIND OF ANTIMONY.—*Record*: V. VanBuren has recently discovered on the southeast end of Admiralty Island, about 1½ miles back from salt water, a well-defined three-foot vein of nearly solid antimony. The vein runs through a porphyry formation of a gray color. It is easy of access from the beach and no gulches have to be crossed to reach it.

THE JUNEAU MINING COMPANY.— *Record*: The Juneau Mining Company will have taken the last load of machinery for their 30-stamp mill to the Basin by the last of the week. There yet remain 200 cords of wood to be hauled to the mill, after which the teams will be sent to California.

THE BEAR'S NEST.—Parties interested in the Bear's Nest property on Douglas Island have arrived with two diamond drills for sinking in search of the ore.

WYOMING.

ASBESTOS FIND.—A Casper dispatch says: "Messrs. Currier, Nelson and Johnson, who have been prospecting for asbestos on Casper mountain, have brought in 500 pounds of fiber equal to any of the Canadian product." The asbestos is of a greenish shade, and the find is regarded as valuable.

IDAHO.

THE LUCKY BOY CO.—The Lucky Gold Boy Miniug Company, composed of Salt Lake capitalists, and owning a group of mines in Custer county, Idaho, has purchased the properties and mill of the Dickens-Custer Mining Company, adjacent to the Lucky Boy group. The Dickens-Custer mines were formerly owned by J. B. Haggin, who sold them to an English syndicate. They have produced about $4,000,000 in gold, but have been idle for some time. The consolidated properties will be operated by the Lucky Boy Company on an extensive scale.

ARMS AND AMMUNITION.—Under instructions from Governor McConnell of Idaho Adjutant-General Caldwell proceeded to the Cœur d'Alenes last Wednesday with eighty stacks of arms and 5000 rounds of ammunition, where he will recruit and equip a company of 140 militia from the miners of the Bunker Hill and Sullivan mines in anticipation of an outbreak. It is asserted at Canyon Creek that

the Canyon Creek Union has openly threatened that they intend closing the mines if they have to kill or run every non-union miner out of the country.

UTAH.

WATER FOR THE MARSAC.—*Tribune:* The Marsac mill has been somewhat short of water since the great Ontario drain tunnel was completed, and is now making arrangements to secure the overflow from the Park City waterworks reservoirs in Empire canyon.

To this end a tunnel will be driven through the ridge between that canyon and Ontario canyon, and a flume built leading from just below the reservoirs to the flume coming from the mouth of the Ontario tunnel near the Ontario mill. The proposed flume will be some 2300 feet in length, and will be completed this month.

A good strike of ore is reported in the Cumberland group of claims on Tresure hill.

A new mining company was incorporated at Provo, the Grand Central Mining Company, capital stock is $250,000; $100,000 subscribed.

SOUTH DAKOTA.

HARNEY PEAK TIN COMPANY.—Black Hills *Mining Review:* The rumors afloat on the settlement of the American and English stockholders of the Harney Peak Tin Company, we are sorry to chronicle, are wholly unreliable, as no such settlement has been reached, nor is there likely to be at once. It is safe to say that the American shareholders are using all consistent means to bring the adjustment of affairs to a head; and when such a time arrives it is more than likely an American engineer will be in charge. The plea that the appropriation of money drawn from the English shareholders was in many instances misupplied, seems to be more of a chestnut when taken into consideration that all drafts for money from them were made under personal advisement by metallurgical and mining engineers who had been sent by them to America to carefully investigate the mines.

COLORADO.

CAPITAL NEEDED.—Idaho Springs *News:* The miners are working under extreme disadvantage. Capital is needed to put up hoisting plants, concentrating mills, etc. The long haul to railroads is also against them. The character of ore in the camp is principally hematite on the surface, of which there are great bodies. This is practically worthless, but as depth is gained, it changes to iron and copper pyrites which will undoubtedly pay well by concentration.

SAN MIGUEL COUNTY.

COLUMBIA.—Telluride *Republican:* Men are at work wiring the Columbia mine, and in a short time it will be lighted by electricity.

SMUGGLER-UNION.—Work has been commenced on the addition to the Smuggler-Union mill to make room for ten more stamps.

GOLD KING.—The new 100-horse power motor is now at the Gold King, and the work of putting in position was commenced to-day. The old motor will be taken to the Turkey creek mill.

ARIZONA.

AROUND YAVAPAI.—*Journal-Miner:* It is given out that the Yarnell mine and mill will be started up again soon on a more extensive scale than ever before. With the sale of the Johnson mine, the Grey Devil group and the property in Fool's gulch and the probable erection of mills on each and the working of the Yarnell mine and mill, handreds of men will be employed in that section, and the bullion product increased.

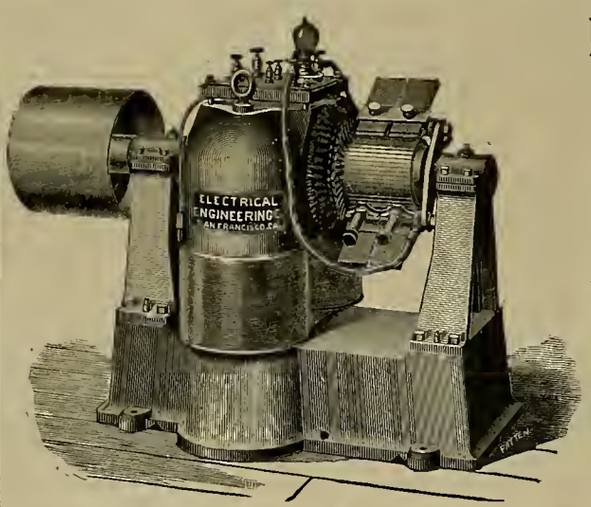
IN GENERAL.—The Phœnix *Republican* says: The most active section of Arizona has been Yavapai county and regions around Prescott. The great Congress mine, an inexhaustible treasure box, that has yielded much riches even to the depth of 1,500 feet, is now working 250 men, while the hills in every direction from Prescott are lined with mines and mills, miners and prospectors, most of whom are doing well. The Santa Maria country, between Mohave and Yavapai counties, is looking up, and several of the larger claims will be worked extensively and systematically.

HUMBUG DISTRICT.—The Columbia Gold Mining Company has bought a group of eighteen mining claims in Humbug district and will develop them on an extensive scale.

GLOBE.—Work will be resumed at Globe in both mine and smelter about the 1st of August. Superintendent Berray has been notified of the transfer of the stock by the Old Dominion Copper Company to the purchasers, the Lewisohn syndicate, and the election of S. A. Bigelow of Boston, Mass., president of the company. A. D. McLean, lately of Morenci, represents the new concern.

A NEW CAMP.—A mining camp is being built up about ten miles from the Gulf of California, near the town of San Antonio. The mines, three in number, are gold properties and are, at present, being worked under a bond by a wealthy company which proposes to purchase the mines if the veins continue to expose the same character of ore as is now being worked. The pay-rock is from three to five feet wide and gives an average of $25 per ton in gold. The mines are owned by J. Gandolfo, of Yuma, Arizona.

LOWER CALIFORNIA.



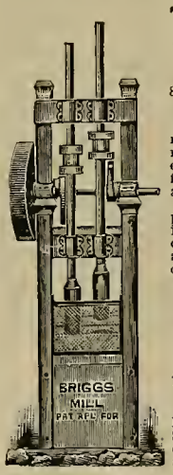
Considerable activity is noted in the northern half of Lower California in a mining way. Further south, at the San Juan silver mines, and the Calmalli gold mines, the output is steady and has ceased to excite remark. The last shipment of gold from the Calmalli mines was $15,000. The average output is reported to be $30,000 per month. The San Juan silver mines get their supplies and ship their product through Guaymas, though Cranz Bros., the owners, have repeatedly offered to throw their immense business to San Diego if steamers are provided to allow of regular communication. The same thing has been said by the French manager of the great Boleo copper mines at Santa Rosalia, whose output compares favorably with the Lake Superior mines.

Power, Mining, Milling, Smelting, Concentration and Leaching Machinery; Return Tubular and Water Tube Boilers, Corliss Engines, Jones' Mechanical Stokers, Hoisting Engines, Riedler Air and Gas Compressors, Riedler Pumping and Blowing Engines, Cornish Pumps, Roots Blowers, Copper Converters, Pyritic Smelters, Horseshoe Roasting Furnaces, Comet Crushers, Crushing Rolls, Stamp Mills, Shoes, Dies, Perforated Metals, Sectional Machinery, Huntington Mills, Frue Vanners, Bridgman Samplers, Concrete Mixers, Heavy Machinery and Mine Supplies. = = Write for Catalogues

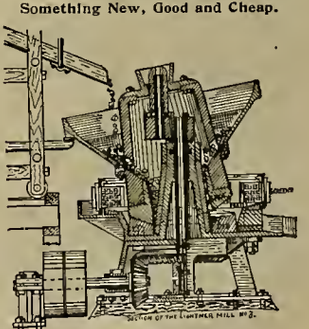
FRASER & CHALMERS
CHICAGO, ILL., U. S. A. and
43 Threadneedle St., E. C., London, Eng.

Our facilities for the manufacture of heavy plate steel work, cylinders to withstand heavy pressures, etc., are especially good. We desire to bid on work in any of our lines, and will give information promptly and cheerfully, and quote as low figures as consistent with first-class work. We think we can meet your ideas both in quality and price.

Works at Chicago, Ill., U. S. A., and Erith, Kent, Eng.
Branch Offices: 2 Wall St., New York; City of Mexico, Mex.; 527 17th St., Denver, Colo.; Helena, Montana; Salt Lake City, Utah.



Electrical Engineering Co.,
MANUFACTURERS OF
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.
Electric Power Apparatus
FOR
Quartz Mills, Hoisting, Pumping, Drilling,
And all Mining Work where Long Distance Transmission is required
A SPECIALTY.
OFFICE AND WORKS: 34 and 36 Main Street, San Francisco, Cal.



THE WILSON
HIGH GRADE STEEL
SHOES
—AND—
DIES.

Guaranteed to Wear Longer and Prove Cheaper than any others.
Made by use of Special Appliances.
PATENTED AUGUST 16TH, 1892.
—Made only by—
Western Forge and Rolling Mills,
ST. LOUIS, MO.
WM. A. HEWITT, - - Agent,
11 and 13 First St., San Francisco.

UNION IRON WORKS,
SACRAMENTO,.....CALIFORNIA.
ROOT, NEILSON & CO.,

GREASE CUPS

Why is it that everybody calls for LUNKENHEIMER'S "Ideal" Automatic Grease Cup? Because it is a perfect Cup, simple and practical in operation, ornamental, low-priced. We also make other styles for various purposes: "Tiger," "Marine," "Jewel," "Obio." All first class and warranted. "LUNKENHEIMER" on brass goods means the best. A trial will prove their superior merits. Our Catalogue will interest you. Gratis upon request.

Practical Information.

California Prehistoric Remains.

Some weeks ago, in the asphaltum mines in Kern county, miners working 120 feet helow the surface excavated the skull of a large prehistoric animal.

The hones were imbedded in the asphaltum deposit, and in close proximity were pieces of wood in a fair state of preservation. Fossils in the earth are nothing uncommon, hut this skull is more than a fossil, and has a peculiar significance in the study of geology and natural history. There are several teeth in the jawhone that still have a coating of enamel, which proves that æons of ages ago beasts moving amid the desolation of earth had teeth differing none either in texture or form from the present age. The enamel is well preserved in color and suostance, though inside it the dentine is changed to asphaltum.

The head is not perfect, as part of it had either turned to the black suhstance itself or rotted away, although there remains enough to show that it was larger than a horse's head and shaped like that of a moose. The teeth are larger than those found in a horse, heing ahout three or four inches long and one and one-quarter inches wide, and are arranged in long rows. From the forehead a massive horn protrudes like the spike of a rhinoceros, hut of a different shape, being flat and resemhling the hroad portion of the deer's horns. It gives the head a formidahle aspect. Now it is merely asphaltum that indicates the hone fiher.

As a scientific discovery, the importance of these fossiliferous fragments can he appreciated when it is known that scientists differ regarding the origin of asphaltum. Some of the most eminent geologists have satisfactorily reached the conclusion hy inductive processes that it is a mineral formed hy certain chemical action, while others, whose standing entitles their opinions to quite as much respect, claim it is a vegetahle substance, or at least organic, and prohably was animal matter similar to that found at the hottom of the ocean.

The fragments are now packed ready to be sent to the University of California, where they will be classified, if possible, and preserved as some of the most interesting specimens in the Berkeley Museum of Natural History. The fragments imhedded in asphalt will also be forwarded, and no doubt there will not he much difficulty in determining its species.

Practically little geological work has heen done in the regions where the fossils were found. Fifty miles west of Bakersfield, high up in the desolate mountains skirting the western San Joaquin valley, this strange land lies. Blinding ashes and parched dust, pools of liquid asphaltum and streams of that pitchy viscid stuff trickling from cracks in hillsides; creeks and little lakes of sulphurous water emitting a gas that ignites and blazes, great masses of hitumen protruding from the ground like lava grown cold; all these together and a soil on which a strange stunted underbrush grows form its characteristic landscape.

There are large heds of infusorial earth 300 to 400 feet thick and extremely light. The surface is bleached intensely white hy the sun burning out the little asphalt oil on top. Underneath is a hrown, impalpahle dust like volcano ashes—a mighty ash heap and yet composed of shells of the infusoria, visihle only under a powerful microscope.

From the presence of this dust it may he taken that asphalt is infusorial also, being formed out of animal matter, of infusoria, while the mineral matter, or white shell dust, remains ahove it.

There are beds of brown sand, almost a sandstone, parallel to the direction of the asphalt deposits, and seemingly underlying them in the strata. This hrown sand coheres through the agency of asphaltum material in it, and has stood like a dike against the erosion as geological periods.

One more interesting feature of the district is the mineral tar, as it is commonly called, or liquid asphaltum. It exudes in many places and trickles down hill until a hollow is reached and black pools are formed. In those pools lizards, beetles, rabhits, birds and even a deer and a bear have been found, all emhalmed hy the liquid that kills them.

Blew Itself Out.

The "Big Moses" gas well, on the Spencer farm, on Indian creek, Tyler county, W. Va., which was struck by lightning recently, extinguished itself the same evening, after consuming the derrick and all the combustihle matter within reach. The pressure was so great that the well simply blew itself out, after furnishing the natives of that country with a grand sight.

No one could go near the hole, aud the swaying to and fro of the great, invisibly supported flamheau, hundreds of feet high, and its deafening roar, made an awe-inspiring comhination.

Nothing had ever been struck that approached the "Big Moses" in magnitude. The pent-up pressure, when furnished an avenue of escape through an eighth and one-fourth-inch hole, for three months defied every effort to hring it under control. The earth tremhled within 1000 feet of the well, and the roaring monster could be distinctly heard for a distance of twelve miles. No accurate gauge of this Jumho of gas wells has ever heen taken. At one time a partial test was made with an ordinary steam gauge, and it showed a pressure of forty-four pounds from an 18½-inch opening. At another time, from a three-inch opening, it showed a pressure of 600 pounds the first fifteen seconds. Then attempts at a complete test had to be ahandoned. When flowing through the casing its daily capacity was estimated hy experts to be from 80,000,000 to 120,000,000 cuhic feet.

The well was struck in Novemher of last year, and during six months of the time since then the valuahle fluid went to waste. Taking the lowest estimate, 80,000,000 feet a day, and compute its value at 25 cents per 1000 cuhic feet, as charged hy the Pittshurg companies, for a period of six months, and the result shows that the selling value of this wasted gas in Pittshurg would be $3,640,000.

The Carnegie Gas Company's expert visited the well and estimated its capacity to be great enough to supply fuel for the entire Homestead plant, if it were accessihle. Another expert expressed the opinion that its output would he equal to the demands required to furnish the entire city of Pittshurg for domestic purposes.

The owners expended $5000 in shutting the well in, and three months afterward it broke through and forced its way up through the surface. A powerful pump was then set up near the well, and for five days they pumped water into the monster, with the hope that the gas pressure could he crowded hack, and give them a chance to put in a packer, hut their efforts proved futile, for the water was again forced to the surface from fissures that it made, and the result was a dozen of geysers spurting up into the air. Some of them made their appearance half a mile from the well.

"Convergence of Ancestry."

It goes without saying that a man has two parents, four grandparents, eight great grandparents and so on, so that if we go back ten generations, doubling at each step, we have 2048 ancestors. This sort of argument has heen used hy superficial genealogists to show that 1000 years ago each of us had more ancestors than the total population of Europe, hence we must each he descended from every European of that day.

The absurdity of this sort of reasoning has just been pointed out by Prof. Brooks. His immediate ohject is to estahlish a point in the theory of evolution, but he confutes all silly genealogists at the same time. While it is true that we do have four grandparents, they need not be four separate and distinct persons. First cousins have not more than three separate grandparents; if they are douhly cousins, they have but two. So in the tenth generation one's 2048 ancestors are never 2048 separate persons; they ahound in "duplicates," so to speak, as every one knows who has tried to trace his descent, not in one line, hut in all possible lines. These duplicates abound especially in small communities, whose inhabitants have intermarried for years.

Besides this the lines from a given pair of ancestors tend to become extinct sooner or later, so, as ancestry is traced back, the prohahility is that all the persons living in a given community will be found to he descended, not from all, but from a very few—perhaps only one or two—of the inhahitants of the community as they were centuries ago. So instead of having all Europeans of the year 900 for our ancestors, the probahility is that we are descended from comparatively few of them—the number may he technically many thousands, hut one individual does duty for several scores, or even several hundreds of these, the lines of ancestry converging upon him from many different directions. This is what Prof. Brooks calls the "convergence of ancestry."

An Important Decision.

On the 18th ult. the U. S. general appraisers made a decision of considerable importance to American lumhermen, hy which Canadian lumher manufacturers must hereafter pay a 25 per cent duty on the value of any lumher destined for the United States markets which they may wish to joint or match or head or prepare in any way except planing of one or two surfaces. This gives our American manufacturers a 25 per cent advantage over the Canadians on every spruce or pine board which is to he tongued and grooved, jointed, moulded or headed, or in any way advanced in manufacture beyond the simple planing of one or two sides to hring the same to an even thickness. This decision adds at once $2 to $4 per thousand feet to every American spruce hoard or plank intended for "dressed lumher," according to the interpretation of the general appraisers. It will lead to a largely increased demand for American spruce boards and plank, and to more firmness in prices. The Canadian lumher mills cannot afford to pay 25 per cent ad valorem duty on dressed lumher and compete with American mills.

Private Electric Motors.

It is now almost as easy and cheap to have an electric elevator in a private house as in a large office building. The cost of operating an electric elevator in, say, a five-story house, making fifty or sixty trips every day, will not exceed $3 or $4 per month. The devices for operating these elevators have been so improved that an invalid or a child can manage them. The old lever arrangement can be dispensed with, and the elevator ascends or descends on the pressure of a button. It will stop only at each floor and will start only when the elevator door is closed.

STATISTICS show that an inch of rain falling upon an area of one square mile is equivalent to nearly 16,000,000 gallons, weighing 145,200,000 pounds, or 72,000 tons. Assuming this water to have fallen from clouds about half a mile, or say 3000 feet above the earth, we have for the energy represented hy it about 28,000 horse power. With pumping machinery working at the low rate of consumption of two pounds of coal per horse power per hour, it would take 200 gross tons of coal to raise the water represented hy an inch of rain on a square mile to the assumed height of 3000 feet.

First Prize and Gold Medal Awarded by World's Fair, 1893.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

CLEVELAND IRON ORE PAINT CO.

THE AM. BALL PULVERIZER
Morris Patent.

PLACER
Amalgamators, : Dredgers, : Shovels.

Complete "Lancaster" Gravity Gold Amalgamating, Hoisting and Dredging plants furnished for treating large quantities of low grade placer ground and pulverized free milling quartz at small cost with minimum supply of a water. **Highest possible Gold yield insured.**

The "Lancaster" 1895 Land or River Dredges, Grapples, Scoops, Steam Shovels and Cableways are of the most improved construction. Success guaranteed. Capacity, one hundred tons hourly and upward, if required. **Crushing, Pulverizing, Concentrating, Screening, Pile Driving and other machinery also built.** Investigation and correspondence solicited.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Market Reports.

The Markets.

SAN FRANCISCO, July 11, 1895.

There is an advance in iron, steel, and products therefrom, of 10 to 30 per cent. Silver slightly advanced during the week.

Concerning copper, under date of July 1, D. Houston & Co., New York, say: Firmness and strength have been apparent throughout the month; transactions during the past 30 days aggregate a total of several million pounds of each variety, a large proportion of the business being done at 10¾ cents for Lake, with deliveries running two or three months ahead. Lake brands have been selling on a basis of from 10¾ to 10¾ cents per pound. As most of the large consumers contracted for several months' supplies of copper in April, when prices were very low, they have not been compelled to make any purchases since. Producers, therefore, have yet to reap the benefit of the rise in copper to any very considerable degree. The market is in excellent shape, and singularly free from anything suggesting apprehension regarding its future course. Conditions have changed, and the whole trend of affairs is towards a higher range of values, with the prospect of an increasingly active demand, both at home and abroad, especially during the fall. Electrolytic and casting copper has met with good request, and sales of considerable quantities have been effected at full market rates. Among the latest transactions reported is a sale for export at 10¾ cents by the Calumet & Hecla Co. The quantity involved is understood to be 1000 tons, and said to be for shipment to Russia. The effect of the sale was to impart additional tone to the market. Prominent financiers in Europe, of great influence, are interested in copper, the soundness of the metal at present attracting much attention. There is no oversupply disturbing the market.

From 1880 to 1891 consumption increased about fourfold, and from 1,000 pounds per capita in 1880 to 3.006 per capita in 1891. Taking the amount of copper produced in the United States for the twelve months ending May 31, 1895, less the amount exported, as representing domestic consumption during that period, it equals only about three pounds per capita, as compared with 4.008 per capita in 1892. Is it too much to believe that, when consumption of copper in the United States fully reaches normal proportions again, it will then be much nearer five pounds per capita than three pounds? In that event, this country could scarcely spare much more than 10,000 tons per annum for export on the basis of present production.

Exports of copper from the United States for twelve months ending May 31, 1895, were 69,953 tons, or 27,975 tons less than for the twelve months ending May 31, 1894. The shipments from this country during these two years to England and France alone was as follows, in pounds fine:

	May 31, 1895.	May 31, 1894.	Decrease.
To England	60,692,310	103,761,294	43,068,984
To France	24,072,805	29,557,012	5,484,207
Totals	84,765,115	133,318,306	48,553,191

Here we have England and France during the last twelve months ending May 31, 1895, taking an amount of copper produced in this country equivalent to the entire annual output of the Calumet & Hecla, Quincy and Osceola mines combined. If these three leading Lake producers should announce that every pound of their production for a whole year was to be shipped out of the country, what a factor of sensation the announcement would prove on the market. Furthermore, so well has the combined exports to these two countries named been absorbed, that on June 15, 1895, the total stocks of American copper reported in public warehouses in England and France amounted to but 4128 tons, or only 426 tons more than on June 15, 1894.

With consumption both at home and abroad increasing, and demand growing through expansion in electrical and other departments requiring copper, the expectation of better trade, together with a higher level of values, may well become a settled conviction.

Exports of copper from the United States in June will be in the vicinity of 8000 tons, but a falling off in shipments may be looked for hereafter, as the large quantities due on contracts to American consumers will necessitate keeping the more copper here. Prominent shippers say very emphatically that later on this country cannot spare as much copper for export as went abroad last month.

The market for copper closes very firm at 10.62½ to 10.75 for Lake, 10.45 to 10.50 for electrolytic, and 10¼ for the standard quality of casting copper. Electrolytic especially is in scarce supply, and reported so well sold up that orders for delivery in July could not be filled.

Mining Share Market.

SAN FRANCISCO, July 11, 1895.

Since the resumption of business in the Stock Exchanges after the Fourth prices have been firmer. The beginuing of work on the Brunswick lode has stiffened all the Comstocks, Occidental showing particular strength. The Occidental mine, which has been worked more or less regularly for nearly thirty years, and which is still being very successfully worked, is on the Brunswick lode, and it is the only mine on the lode that has ever heen opened and worked in accordance with moderu methods. It has yielded over a million dollars. The late Senator Fair, who once controlled it, had a high opinion of its value, and held on to it long after he had parted with most of his other mining interests on the Comstock. He was always of the opinion that there was something in the mine that was of far greater value than any of the ore hodies that had yet heen found. He did not know where the suspected wealth lay, nor in what shape it would be found, but his mining instinct suggested that the mine was a valuable one.

The following illustrates the changes of the week:

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Kendall et al., in the Sharp Mine, near Brandy City, Sierra Co., to impound tailings in Sharp Ravine, an old pit, and on the bank of the north fork of the Yuba River; from W. R. Atkinson et al., in the Homestake Mine, near Gold Lake, Sierra Co., to impound tailings in a ravine; from Toland & Laugdon, in the Corkscrew Placer Mine, near Spanish Ranch, Plumas Co., to impound tailings in ravine below the mine and on bank of Spanish Creek; from Henry Goering, in the Last Chance Mine, near Gold Lake, Sierra Co., to impound tailings in a dry ravine; from James Chapelain, in the Chapelain Quartz Mine, near Bakerhy, Yuba Co., to deposit tailings in Honcut Creek; from Luigi Lagomacini, in the Roomie Mine, near Loganville, Sierra Co., to impound tailings in an old pit; from T. T. Kirkham, in the Big Ravine Mine, near Blue Tent, Nevada Co., to impound tailings in ravine below the mine; from the Interior Development Co., in the Brown Placer Mine, near Michigan Bar, Sacramento Co., to impound tailings on flat ground near Arkansas Creek; and from the Cascade Water and Mining Co., in the Cascade Mine, Beckwourth Tp., Plumas Co., to impound tailings in Grizzly Creek, gives notice that a meeting will be held at Room 82, Flood building, San Francisco, Cal., July 29th, 1895, at 1:30 P. M.

Assessment Notices.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the eleventh day of June, 1895, an assessment (No. 19) of Five (5c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the sixteenth day of July, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the sixth day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor, Mills building, corner Bush and Montgomery streets, San Francisco, Cal.

BULLION MINING COMPANY.—Location of principal place of husiuess, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the twelfth day of June, 1895, an assessment (No. 45) of Ten (10c) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the seventeenth day of July, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the seventh day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expeuses of sale. By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine St., San Francisco, Cal.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of husiuess, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporatiou, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will he delinquent, and advertised for sale at puolic auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOULD AND CURRY SILVER MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the secoud (2d) day of July, 1895, an assessment (No. 76) of Fifteen (15c) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixth (6th) day of August, 1895, will he delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the Twenty-eighth (28th) day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expeuses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, Califoruia.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, Califoruia.

Notice is hereby given, that at a meeting of the Board of Directors held on the 8th day of July, 1895, an assessment (No. 27) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 12, rotuuda, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 4th day of September, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. W. SARGEANT, Secretary.

Office—Room 12, rotunda, Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of May, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.

And in accordauce with law, and an order from the Board of Directors, made on the 24th day of May, 1895, so many shares of each parcel of such Stock as may be necessary will be sold at public auctiou at the office of the Company, Room 37, Crocker Building, corner Montgomery and Market streets, San Francisco, California, on Monday, the 22nd day of July, 1895, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessmeut thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office—37 Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

H. P. TAYLOR MINING COMPANY.—Location of principal of business, San Francisco, California. Location of works, Liberty Mining District, Siskiyou county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 19th day of April, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
William Patterson	7	12,492	$499 68
Howard P. Taylor, Jr.	8	12,493	499 72
J. Henry Smith	9	12,492	499 68
Howard P. Taylor, Jr., Trustee 10		12,498	499 92

And in accordance with law and an order from the Board of Directors made on the 19th day of April, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 39 Merchants' Exchange, 431 California street, San Francisco, California, on FRIDAY, the 26th day of July, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. HENRY SMITH, Secretary.

Office, Room 39 Merchants' Exchange, No. 431 California street, San Francisco, California.

HOIST FOR SALE

CHEAP!

One single-drum water power friction hoist, with five-foot "Pelton" wheel arranged to work under a 660-foot head, and hoist from a depth of 400 feet. Load, 3300 pounds 300 feet per minute.

WILL SELL AT HALF COST; but little used, and works splendidly.

For further particulars apply to

PELTON WATER WHEEL CO.,

121 Main Street ..... San Francisco

—OR—

Superintendent James Harry,

New Almaden ..... California

WANTED!

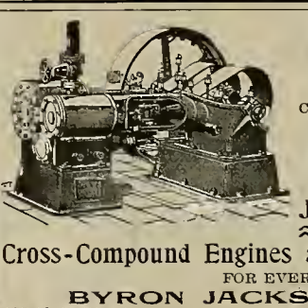
A Gold Quartz Mine

For a first-class client. No property hut that which will stand close investigation will answer. A dividend-payer very much desired. Parties having good gold properties for sale at true value are requested to correspond with

J. F. CROSETT,

MINING AGENCY,

628 Sacramento Street ..... San Francisco.



DIVIDEND NOTICE.

The German Savings and Loan Society,

526 California Street.

For the half year ending June 30, 1895, a dividend has been declared at the rate of four and eight-tenths (4 8-10) per cent per annum on Term Deposits, and four (4) per cent per annum on Ordinary Deposits, free of taxes, payable on and after MONDAY, July 1st, 1895.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

METALLIC TILE ROOFING.—Wilhelm Hille, Alameda, Cal. No. 540,913. Dated June 11, 1895. This invention relates to that class of metallic roofing in which sheets of metal, usually in the form of galvanized iron, are laid together with suitable joints and form a waterproof coverlag for all portions of the roof. The inventiou consists in the particular and novel construction and arrangement of the sheets of metal forming the roofing, the means by which they are secured in place, and the joints by which they are connected. The objects of the invention are to provide a metallic roofing of the tile form, adapted to be secured to the board plates by means which are both concealed and are protected from the rain, and to unite the plates of which the roofing is composed by means of joints of such a character that while they afford full connection they are also waterproof.

GRINDING APPARATUS.—W. F. Nichols and B. Bloomhart, San Francisco, Cal. No. 542,099. Dated July 2, 1895. This device, though it can be used for grinding various tools or implements, is especially intended for sharpening shears, to which use it is particularly applicable, as it holds the shears' blade accurately at the proper angle, and guides its edge equally throughout its length, and this without the exercise of any skill on the part of the operator, thus enabling any one—barbers, tailors and the like—to sharpen shears when needed without delay or expense. The apparatus consists of a hopper adapted to contain water, a shaft removably mounted in the hopper, a clamp carried by the removable shaft, pivots about which the clamp is turnable, a longitudinally slidable rotary shaft mounted upon the hopper and a grinding wheel carried by said slidable shaft. The shears are held in the clamp by the several movements of which the blade can be adjusted to the proper angle on the stone, and this angle may be preserved by tightening up the clamp. The stone is then moved sidewnys back and forth over the whole length of the blade as the grinding proceeds.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1906 Stockton St., San Francisco.

VOLUME LXXI. Number 3. SAN FRANCISCO, SATURDAY, JULY 20, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Pneumatic Boat.

Among recent novelties is an ingenious craft designed by H. D. Layman, 853 Broadway, New York, which is receiving extended notice. It is described by its manufacturer as a pneumatic boat, made of rubber cloth, and shaped like a horse collar. From the forward part of the bottom depend two boots, or leg cases, the ends of which are provided with collapsing paddles, which open on the back stroke and close on the forward stroke, like a duck's foot. The small end of the oval is the bow, and a stiff rudder strapped in one position to the stern keeps the bow in front. The boat is prepared for use by inflating it with air by means of a blower. It takes from three to five minutes to get it ready. The boatman puts his feet into the cases, and, holding up the boat by the loops, he walks down to the water and launches himself. It is claimed there is no danger of capsizing, as the center of gravity is always below the water line. The user of this strange craft may paddle himself in any direction at the rate of two or three miles an hour. Ladies and children may use it with safety in calm water.

One of the accompanying illustrations shows a family party on Narragansett bay, fishing from these boats. This picture was made from a photograph taken from life. The other cut shows a passage through Hell Gate, East river, which was made without difficulty by a party, including a woman.

The boat seems to possess practical value. The arms and body of the occupant are free for the use of gun or rod, and in moving about there is no noise or splash. In rough weather and water a rubber storm cape can be used, which is fastened under the breakwater by a cord. Speed is not a factor, but two or three miles an hour can be attained. The adult boat measures 44 inches long by 34 inches in breadth, and will draw from two to five inches, according to weight imposed; when collapsed, it weighs about fifteen pounds, and can be folded and packed in a valise. In yachting it can be used to get to or from large boats in deep water without a tender, and as a life preserver can quickly be made ready for use.

The illustrations convey a good idea of its appearance and designed use.

From the Melbourne Department of Mines is received a special report by H. Rosales on the "loss of gold in the reduction of auriferous vein stone," which in quality and appearance is superior to former reports from that quarter. It is an account of an inspection of the appliances at the principal Australian mines with a view of securing better methods for saving the fine gold and treating the sulphides—the same problem that is deemed susceptible of solution in other parts of the world. It was estimated that the average loss was two pennyweights of gold per ton, representing a loss of $1,800,000 on the aggregate of '94. Mr. Rosales gives in detail the results of his observations during his visits to the different Australian gold mines and recommends changes in the present methods. In his judgment automatic appliances for the more subdivided separation of coarse and fine sand and slimes will greatly aid in the matter. By eliminating what appears to be advertising reference, and leaving out considerable repetition, the treatise would be of value as a contribution to current literature on this important question.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A Pneumatic Boat, 37. The Reliance Crushing Rolls, 41.

EDITORIALS.—A Pneumatic Boat; Report from the Melbourne Department of Mines, 37. Longer Working Hours in This City; Official Value of the Mexican Dollar; Large Sales of Blasting Powder; "History Repeats Itself;" Japan Buying Mining Machinery; Cause for Congratulation; Success of the Folsom Power Transmission; Production of Silver; Protecting the Mineral Lands; Debris Commission's Report, 38.

CORRESPONDENCE.—The Sultepec Mining District, 41. The Mineral Lands of the State, 42.

SCIENTIFIC PROGRESS.—Self-Induction in an Electric Wire; Dynamo and Steam Engine Efficiency; "Running Slow" of the Earth; The Telautograph; The Intensity of Starlight; Brilliant Light Under Water, 43.

MECHANICAL PROGRESS.—Long-Distance Power; Vehicle Motor Race; Machinery and Men; Trials of a 330-Horse Power Gas Engine Using Power Gas; The Seasoning of Stone; Acids in Lubricating Oils; Salt Removed from Ocean Water, 43.

ELECTRICAL PROGRESS.—The Folsom Power Transmission Plant; Effective Electric Lighting; Fresno's Electric Transmission Project; Winding Coils in Dynamos; Incandescent Electric Lights in New York Bay; Electricity at Atlanta, 44.

PRACTICAL INFORMATION.—A Bicycle Factory, 44; The Wheel; Human Beings Unconscious Before Death; Color of Oxen Among Mexican Farmers, 45.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 46.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 50.

MISCELLANEOUS.—Concentrates; Obituary, 39. The Trail Creek Country; Mine Management on the Randt; The Price of Amber; A Just and Dignified Protest; Salaries on the American Liner "St. Louis," 40. The Reliance Crushing Rolls; Men Composed Chiefly of Charcoal and Water; The Longest Railroad Tunnels; Workmen Have Benefited by the Recent Increase in Wages; A Large Aluminum Plant; The Foremost Shipbuilders; Elements of Motion; Temperature of the Gulf Stream, 41. Pithecanthropus Erectus; Exporting American Ore; Coast Industrial Notes; Europe's Gold and Silver Yield in '94, 42. Notices of Recent Patents, 51.

COMMENTING on industrial achievements in this city, the Salt Lake *Tribune* calls attention to the fact that men can work more hours in the day, and more days in the year, in San Francisco than in any Eastern State.

THE Secretary of the Treasury places the official value of the Mexican dollar for customs purposes at 52.8 cents for the current quarter. For the quarter ending June 30, it was 47.9. The current local quotation is 54½.

THERE is an unusually large sale of blasting powder by San Francisco manufacturers at present, which is another indication of the great renewal of activity in mining operations. Competition has, however, so reduced the price that there is little profit in the business.

WHEN the first steamship crossed the Atlantic its arrival was simultaneous with the appearance of a learned treatise by a learned pundit proving that it was an impossibility for a vessel propelled by steam power to cross the Atlantic. Coincident with the successful transmission at Sacramento of 80 per cent of the electrical power generated over twenty miles distant, appears a pamphlet written by a well informed man arguing that such transmission is an impossibility. "History repeats itself."

JAPAN shows a desire to buy mining machinery; the Mikado's government has appointed R. P. Forshaw a commissioner to visit England and secure "better interworking between Japanese merchants and others and British manufacturers direct." It is further stated that "all financial arrangements are to be amply secured by the chief Japanese banks." The natural source of supply of Japanese mining appliances is this country, where new and improved forms originate, and, geographically, the United States should and doubtless can successfully compete for desirable business in Japan. The matter is worthy of immediate and earnest attention.

THE success of the Folsom power transmission by which electrical power generated twenty miles from the California capital is delivered in that city is a scientific event of surpassing interest to the industries of the State. The distance is so unusual and the scale so great that some doubt was felt as to the result, but now that it is an assured reality it is apparent that the same thing can be done in other parts of the State, in several instances revolutionizing existing methods. It has been stated in the daily press during the week that the entire plant of the Folsom Water Power Co. has been turned over to the State. The power house at Folsom, the dam and the canal belong to the company. The power house and plant at the State prison belong to the State. The State gets the use of the first five feet fall of the water—an estimated 1000-horse power. The expense involved in this undertaking is considerably over half a million dollars, a large part of which represents the share of the General Electric Company, which supplied the electric appliances on the correct assumption that skill and energy would ensure commensurate return on the outlay.

APART from the satisfactory success of the Folsom electrical transmission scheme, there is additional cause for congratulation in the fact that it will encourage similar enterprises all over the State and coast. It has been viewed by many as an experiment; the demonstration of its ability to do all claimed for it, and more, will be of general value to the industries of the coast. The largest electric power plant in the world for running machinery at a distance is now in successful operation at Folsom in this State, transmitting power over twenty miles. The Niagara power is carried seven miles. Tesla is quoted in a New York paper as saying that he has perfected a means of successfully conducting the power from Niagara to New Orleans. While this is probably an exaggerated report of what that eminent electrician said, yet it is manifest that the twenty miles from Folsom to Sacramento is not the limit of successful transmission of electric power.

THE figures for '94 show that about $14,000,000 less in silver was produced in '94 than in '93. The fact that it was not $40,000,000, or some amount considerably greater than $14,000,000, is commented upon by some of our Eastern friends as showing that, after all, their statements about "cheap silver" are so, and that silver can be profitably produced at sixty cents an ounce or less. They argue that if the claim of the silver miners that silver can not be produced for less than $1 per ounce was so, the shrinkage in the price of silver would have cut down the silver output of '94 much more than it did. Their point of view needs adjusting. The figures for '94 don't give correct data to judge fairly. Many a mine yielded silver in '94 that had been developed a year before, all ready to mine and mill; it was a matter of knowledge just how much could be got out; the most costly part of the work had been paid for. But as fast as those developed ore bodies were mined and milled there was no further development work done; the reserves being exhausted. the stamps were hung up. The real comparison is to be made by this year. When the silver yield of '95 is made up our Eastern friends will readjust their parallax and, probably, understand this matter a little better. The decrease in '95 from '93, or even '94, will be a striking object lesson. Nothing will have so great an effect on the price of silver as the cold logic of the figures that will be published about six months from now on this subject. Of course, the exact official figures showing the precise silver yield of '95 cannot be given out for nearly a year yet, but approximately there will be a close estimate, shortly after the close of the year, that will give silver an upward tendency.

THERE is an apparent lack of interest in the work of protecting the mineral lands of the State from being absorbed by the S. P. and other railroad corporations, among the men most directly interested—the miners themselves. The committee that has this matter in hand is doing all it can, but apathy and indifference in many of the mining counties tend to neutralize their efforts. This is a question that affects the miner and prospector. If the mineral lands of the State are to be tied up in the manner contemplated by corporate action it will limit the area in which prospecting can be done, which is none too large now, and will limit the demand for men, machinery and supplies. It is a question of serious consideration to every one in any way connected with the mining industry of the State, the prospector, the manufacturer, the miner, the mine owner, the merchant, the professional man, all whose business in any way depends upon the active development of the mines. Whether quartz or hydraulic mines, the matter is of equal importance, for what affects one, affects all. Speciously worded letters are appearing in several journals in the State, often with favorable editorial comment, the purport being to lull the miner into false security. Activity is needed in the county branches of the State Miners' Association; the committee is in immediate need of money to successfully carry on the work entrusted to it last November, and which has been energetically pushed, and if the 14,000 miners of California realize the need of immediate response in this matter much can be accomplished that otherwise must go undone. The PRESS has had so much to say on this subject that at times it may seem tiresome to some of our readers, but it is the most important matter before the miners of California to-day, and this paper is only doing its duty in directing attention to the situation. There is grave danger that official zeal in the department offices at Washington, and skilled activity on the part of the railroad people will thwart public justice, but the gravest feature of the situation is the indifference and apathy with which many, who through self-interest alone should be alert, seem to view the trend of events.

Debris Commission's Report.

The report of the California Debris Commission for the year ending June 30, '95, is a terse business document, devoid of opinion or theory; full of facts and briefly reciting the operations of the organization for the past year, showing that the provisions of the bill creating the commission have been justly and faithfully followed. Since its organization there have been 139 applications received for permission to reopen or operate hydraulic mines, of which 69 per cent has been granted. Of those so granted a few have been canceled and others temporarily suspended because of failure or neglect to comply with the requirements under which the permit was granted. The report estimates that the total amount of material mined under the granted permits for the nine months from October 1st, '94, to June 1st, '95, is 900,000 cubic yards; that there is available storage provided for 5,000,000 cubic yards. Regarding river improvement, the report speaks as follows, which is a subject for further discussion:

The conditions on the Yuba river, near Marysville, do not appear to have materially changed, but what change has occurred appears to be for the better. The causes for this are doubtless the cessation in the flow of detritus into the river and the improved conditions at the mouth caused by the outlet made by the Government two years ago. No work looking to the retention of detritus by bank protection has been done, except some preparatory surveying.

A recent survey of the Feather river shows that exceptionally good water exists for five miles below the mouth of the Bear, indicating that the Feather is at present able to carry off whatever detritus is brought into it by the Bear, and no works for the retention of detritus in the Bear need be now considered. The effect on the general system of detritus of the Bear and from the American cannot well be determined without more information than is now available. Surveys and examination will be necessary.

The two most frequently urged plans for the general storage of detritus are the storage behind permanent dams in the river canyons and in the tule land of the Sacramento valley. It is believed in both cases the cost would be prohibitory. As to the first case, assuming that the cost of the dams should be paid from the profits of the mines concerned, it is to be noted that thus far no owners of mines or groups of mines have asked authority to build permanent dams in the larger canyons, though temporary dams and dams of doubtful permanence have been proposed. The strongest apparent reason for this is that owners do not consider that the profits of the mines would justify the expense of constructing dams.

Of the tule land project, one that has been most prominently urged is that of storing in the American basin on the east side of the Sacramento river just north of the American river and extending up the Sacramento and Feather to the Bear. A project of diverting the Bear and Yuba into this basin was advocated in the last annual report.

The Commissioner of Public Works for California estimates that such a diversion of the Bear and Yuba would involve the purchase of from 75,000 to 100,000 acres of land; the building of a levee on at least two sides of the basin; thirty miles of leveeing of diverted streams on at least one side; twenty miles more of building of costly diverting dams and excavation of extensive channels. Add to these the necessity of crossing large creeks and railroads, it will be seen that the project involves items of expense of such a magnitude that if the scheme is not impracticable on its face, its feasibility can only be determined after careful estimates based upon detailed surveys.

While the commission does not believe any of these plans to be economical and practicable, it is unable from lack of data to state even approximately the cost involved.

Concentrates.

THE pay roll for the Cariboo, B. C., for June was $30,105.

DURING 1894 Chinese in Placer county mined $341,560 with pan and rocker.

THE reported sale of the Pioneer mine at Grass Flat is denied by Supt. Deisoa.

THE North Pole Mining Co. at Boise, Or., will have H. Leipman manage its affairs after August 1st.

THE Trade Dollar, at Silver City, Idaho, ships $50,000 per month in bullion, besides several carloads of rich concentrates.

THE Gold Dredging Company, of Red Rock, Montana, has what is said to be the first electric elevator dredge ever built.

THE Cleghorn Bar mine, middle fork of Feather river, Plumas Co., is to be equipped with suitable machinery and worked.

THE Juneau *Searchlight* says: Lytton Taylor, United States Attorney for Alaska, has resigned to go into the mining business.

THE Alaska-Treadwell Mining Company of Alaska, has declared a quarterly dividend of 37½ cents per share, payable July 29th.

THE Grass Valley *Union* says that I. M. Taylor, the recent purchaser of the Plumbago mine, will have a ten-stamp mill erected immediately.

THE English company which recently bought the Blue Gouge mine, Pleasant Valley, El Dorado Co., proposes to erect a 40-stamp mill.

THERE is renewed activity in the Mammoth district. A 10-stamp mill is building, and preparations making to work some of the mines there.

EX-GOV. BLAISDELL of Nevada, who recently bonded the Maple mine, Canyon Creek, Trinity Co., is having an examination made of the property.

THE Sierra *Leader* is publishing a series of interesting articles on the gold gravel deposits of Sierra county, written by L. D. Davis of Downieville.

UNITED STATES coinage during the fiscal year ending June 30, '95, is as follows: Gold, $43,933,475; silver, $9,069,480; minor coins, $717,594; total, $53,715,549.

BELGIANS, representing $2,500,000, have T. Vandervecken examining Tuolumne county properties this month with intent to invest if reports are favorable.

THE Bullion-Beck (Utah), which declared a $100,000 dividend June 29, declared a $50,000 dividend last Monday, making nearly $2,000,000 paid by that mine.

IT is figured up that for the year ending Dec. 31, '94, Calaveras county was first in California in yield of gold, Placer second, Nevada third, Amador fourth.

THE work of cleaning up the Holmes Mining Company's mills at Belleville and at the Candelaria mill, Nevada, under the Peck contract begins next Monday.

THE executive committee of the California State Miners' Association will hold a meeting at the Palace Hotel in this city at 8 P. M. next Monday, the 22nd inst.

THE Crown Point, Hidden Treasure and White Swan mines, Rossland, B. C., have been bonded to A. E. Humphries, of Duluth, for $75,000; 5 per cent was paid down.

ONE-HALF INTEREST in the Lost Horse mine was sold at San Bernardino last week by G. S. Lines to Capt. Ryan, for $25,000. It is located four miles east and south of the McHaney mines.

MR. SWAIN, representing Baker & Hamilton who recently bought the Confidence mine, fourteen miles from Sonora, Cal., figures on spending $40,000 in machinery and improvements thereon.

HAD the ferry at Northport not broken down, it is estimated that shipments of ore from Trail creek in June would have exceeded 3,000 tons, the value of which would have been over $100,000.

THE first electric hoist placed in the mines of Butte, Montana, was installed last Tuesday at the Virginius—a 50 H. P. There is a large one at the Alta mine, Wickes, Montana, and another at the Poorman, Idaho.

THE Oro Plata Gravel Mining Company has incorporated in this city. Capital stock, $100,000; J. P. O'Brien, C. H. Phillips, H. W. Van Dervaart, W. P. Anson of San Francisco and John Finlay of Alameda, directors.

TWO "expert prospectors from Arizona" are said to have discovered gold galore ten miles from Vallejo, and in two days this week, with a rocker, produced $459 in coarse gold. The statement lacks some elements of fact.

A YEAR ago stock in the Boleo Company, operating mines at Santa Rosalia, Baja California, was quoted at 250 francs per share. It is now 1250. The company is putting in an electric plant for lighting and running all their machinery.

DR. MIDOWIEZ of the Original Quartz Hill Gold Mining Co., of Quartz Hill, Shasta Co., is about to enlarge the mill from 10 to 20 stamps. The doctor, who is president of the company, is now his own superintendent and manager.

W. A. CLARK, the millionaire mine owner, has disposed of his mining interests in Montana to the Anaconda Company. He will remove to Arizona and devote his time to his mining interests there. This statement is denied by Marcus Daly.

A GOLD BRICK worth $2,300, the result of a week's run at the Hart mine, Shasta Co., was lost from a buggy in transit from the mine eight miles to Redding last Saturday and fortunately found almost immediately by a man who promptly returned it.

GEO. D. Burton, a New York electrician, is here with an electric process which he says will extract everything of value in the most rebellious ore at small cost. He proposes to make practical showing of his ideas and may modify his views on this subject.

OF the Trail Creek, B. C., country an American prospector says: "No one here can open a saloon without it has a hotel attachment; no one is allowed to carry a pistol; they may fight with their fists all they please, but any threats of shooting or knifing result in the roughs having their miner's right cancelled and being sent 'over the road,' which means something else occasionally besides being given the usual twenty-four hours in which to leave camp."

THE Nevada *Transcript* says the Champion Mining Co. will build another quartz mill of 40 stamps on the ground purchased of the Wyoming Co., to be used exclusively for crushing ore from the Wyoming. That will give the Champion 70 stamps altogether.

AT Prescott, Arizona, the Arizona Gold Mining and Development Company—J. C. Herndon, J. J. Hawkins and G. B. Semmmeli incorporators—have filed articles. The capital stock of the corporation is placed at $2,000,000 and its indebtedness limited to $100,000.

THE Boston and Montana Copper Co., is now reported earning $125,000 per month, equivalent to $12 a share annually. During May the Atlantic Mining Co., produced 424,187 pounds refined copper. The Anaconda expects its output for '95 to aggregate 100,000,000 pounds.

AT Calumet, Mich., work has begun on No. 5 shaft of the Tamarack mine. It is stated that the shaft will extend vertically almost one mile into the earth before striking the copper lead. It will require four years, working day and night with dynamite, to reach the vein.

DURING the first half of '95 Great Britain shipped to India silver to the value of £1,992,380; to China, £1,100,767; to the Straits, £390,803, a total of £3,483,950. For the corresponding period of '95 the similar shipments aggregated £5,275,521, a decrease so far this year of £1,791,571.

A SACRAMENTO dispatch of the 17th says the executive committee of the State Anti-Debris Association met there the day previous. Reports were made as to movements of watchmen in the mines during the month past, and matters connected with the North Bloomfield suit were discussed.

AT the Alaska-Treadwell operations in June aggregated shipments of $87,697 from 25,991 tons ore milled; tons of sulphurets treated, 398, yielding $28,873. The gross expenses for the month were $22,064. This is the largest monthly bullion shipment and the largest net return in the history of the mine.

DAY & FRENCH, who had the Goldea Chariot and Jesse mines bonded, have bought the property for $9,500. The mines are in a ledge parallel to the Santa Rosa, and seven miles from Perris, Riverside Co. The new owners will, it is stated, put up a 10-stamp mill. The shaft is down 200 feet and will be sunk 40 more.

THE Pioneer mine, Placer county, formerly owned by the Fair estate, which has given employment to nearly 100 men, will be worked on a large scale by the Boston people who recently bought it. A tunnel is being driven 500 feet below the former workings, to strike the ledge at that depth. J. J. Sullivan is the superintendent.

THE Iron Mountain Railway Co., has incorporated with $100,000 capital stock, all subscribed, to build a steam or electric road from the Iron Mountain mine, Shasta Co., to Spring Creek on the California and Oregon division of the S. P. Co.'s lines, 13½ miles, and a four mile branch to Copley. The directors are Messrs. Fellows, Fielding, O'Shaughnessy, Parrott and Eels. The two former are residents of England, the three latter live in this city.

THE statement is going around that figures for '94 show that the United States is third on the list in the amount of gold produced, Africa first and Australia second. It is worth bearing in mind, however, that accurate statistics show that in '94 the United States produced the most gold of any country in the world, and California produced the most gold of any State in the Union. In '94 the gold yield of this country aggregated in value $39,780,962; that of all Africa, $39,546,984; Australasia, $38,478,874.

THE *Enterprise* says the point on the Brunswick lode selected for the commencement of work by the Chollar and Potosi mining companies is midway between the Chollar north line and the center of the Hale & Norcross ground. It is the most convenient place to get at, and as favorable in appearance as any. This brings it but a short distance north of a prominent outcrop of the St. John ground, from which ore has been extracted in days gone by, and from which samples can now be taken running from $2 to $25 per ton.

THE following, furnished by the Tacoma, Wash., Chamber of Commerce, is a statement of the Tacoma smelter for the month of June, 1895: Product—2200 bars bullion, weighing 225,600 pounds; copper matte, 71,800 pounds, containing 1,263.80 ounces gold, at $20.67, $26,123.98; 25,456.09 ounces silver, at .67, $17,055.58; 233,857 pounds lead, at .03⅛, $7,308.03; 23,315 pounds copper, at .09½, $2,214.92; total product, $52,702.51. Number of men employed, 62; pay roll, $4,542.86; wood choppers and teams, $922; total operating expenses, $5,464.86.

THE Idaho Gold Mining and Smelting Company, capital stock $500,000, incorporated this week at Butte, Montana, "to develop the Idaho claims on the Trail creek division of the West Kootenay mining district in British Columbia." The incorporators are O. Durant, of Culpepper, Va.; A. H. Tarbet, of New York city, and P. A. Largey, G. Lavell and W. G. Benham, of Butte. The same parties also incorporated the Center Star Mining and Smelting Company for the purpose of developing the Center Star mine in the same district. That company is also capitalized for $500,000.

THE Big Horn Gold Mining Co. has incorporated in Los Angeles. Capital stock $2,000,000, of which $1,438,000 is alleged to be subscribed. The directors include L. W. Blinn, president, Judge E. M. Ross and Senator White. The mine is located at the headwaters of the San Gabriel river, on the north slope of Mount Baldy, at an altitude of 7500 feet. Reports from the property say the vein is traced for five miles between walls of ledges 50 to 100 feet wide on the surface. Water in the gulch and immediate surroundings will be depended on to develop a 25,000 horse-power. A 100-stamp mill is to be erected by the company.

AFTERMATH of the Cœur d'Alene strikes of '93 comes in suits against the Helena and Frisco Mining Company aggregating $325,500. Sam'l C. Collis sues for $76,000, alleging that he was employed by the company at their property in Shoshone Co., Idaho, on July 1st, '93, as a miner: worked nine days: on the 10th of that month was ordered into the mill, went under protest, and when the strikers blew up the adjoining mill his spine was jarred and his hearing impaired. The estate of M. I. Halcrow sues for a similar amount. The deceased was injured, it is claimed, fatally, he dying some months after the explosion. T. K. Adams sues for $21,500, being deaf and partly blind from the explosion. Other damage suits were also begun, all in the U. S. District Court in this city. The company will contest the claims.

THE Rossland, B. C., *Miner*, declares it not an exaggeration to say that the whole belt of country from the head of lower Arrow lake down the Columbia river to the boundary line and west to Okanogan divide is alive with men. From the headwaters of creeks which fall into Arrow lake on the west, and from the headwaters of Beaver creek and Salmon river on the east, men are coming into Rossland every day with news of discoveries and recording claims. Many of these discoveries are no doubt valueless, and many of these locations will be abandoned, but the exploration of such a gigantic territory is bound to result in the discovery of some camps.

SOMETIME ago the issuance of aluminum coin by a mining company in Lincoln Co., Nev., was commented on. In reference thereto it is worthy of note that Section 5461, Revised Statutes of the United States, says: "Every person who, except as authorized by law, makes or causes to be made, or utters or passes, or attempts to utter or pass, any coins of gold or silver or other metals, or alloy of metals, intended for the use and purpose of current money, whether in the resemblance of coins of the United States or of foreign countries, or original design, shall be punished by a fine of not more than three thousand dollars, or by imprisonment, not more than five years, or both."

W. D. MURDOCK, assistant general agent of the Mexican Central Railway, says there is a great deal of capital going in from other countries and the resources are being rapidly developed. The fact that Mexico is on a silver basis does not frighten away investors. This country does not do as much business there as it should. In the City of Mexico there are only about half a dozen representative American firms. The exports from Mexico have increased within a year from $12,000,000 to $80,000,000, and new manufactures are starting everywhere. The English are investing very heavily in lands and mining, the French, Germans and Spanish go in for mercantile investments, while the Americans are syndicating on large tracts of land.

THE Bald Mountain Mining Company has been incorporated in Oakland to mine in California and Montana. Capital stock, $1,000,000, of which $806,000 has been subscribed as follows: R. S. Leckie, $40,000; W. H. Lee, $40,000; M. C. Rigney, $40,000; H. Edwards, $8000; G. H. Payne, $40,000; Geo. Chase, $40,000; J. T. Carothers, $40,000; John Thaxton, $40,000; Frank Wallace, $20,000; George E. de Golia, $40,000; W. D. Heaton, $80,000; John Smith, $20,000; Isaac Thaxton, $40,000; David Craig, $20,000; Wm. Winnie, $40,000; W. E. Miller, $20,000; Wm. Dahl, $16,000; W. M. Leete, $40,000; R. A. Cameron, $20,000; J. P. McDonald, $20,000; C. E. Colton, $20,000; Dora Frederick, $32,000; Joseph Harris, $40,000. Directors for the first year: W. D. Heaton, M. C. Rigney, W. H. Lee, John Thaxton and George Chase.

Obituary.

Jas. G. Rule.

One of the most famous miners of the coast died suddenly at his home in this city last Sunday. Few men enjoyed higher reputation as a successful miner than "Jim" Rule. Along with Mackay, Fair, Flood and Jones his name is indissolubly connected with the big bonanza days of the Comstock.

He was a native of Cornwall, England, and came here over forty years ago, working for a while in Yuba county and then drifting over to Nevada, where he was soon recognized as a superior and pushed to the front. He there acquired a reputation for "good luck," which stood by him for nearly thirty years. When Jno. P. Jones started to work the Con. Va., "lucky Jim Rule" was appointed foreman, but he and Jones couldn't agree and he left. Years after, when Pine street was about as badly in need of a little ginger as it is now, Rule declared he knew where there was a big ore body near the south line of the Gould & Curry. He was put there and in a comparatively short time unearthed a good-sized bonanza in the Savage almost exactly where he said it was. Then there was a brisk exaltation of stocks, and his luck was unquestioned. He turned his attention to this State, operated a gold mine in Calaveras Co. and, as usual, did very well. In the mid-summer dullness of '93, when a good many seemed afraid to lend nineteen dollars on a $20 gold piece, and there was nothing doing in stocks, Rule came to the city and told the directors of the Con. Virginia that for nearly twenty years he knew where there was a mass of rich ore in a certain level in that mine. His "luck" and former success impelled the directors to enlist his services; they authorized him to spend $4000 a month for six months, and the famous "Rule drift" was run. Stocks took a spurt, and it looked as though old times had come again; but at the end of the six months there was no bonanza uncovered, and for the first time in his life he failed to make good his prophecies or promises. He quit, and for the past year has been working some Tuolumne mines in which he was interested.

There was probably no man living who could "see into the earth" any farther than Jim Rule, and his memory will live as long as that of the famous mines with which he was so long connected.

A. N. Towne.

A. N. Towne, one of the foremost railroad men of the country, died at his residence on California street, this city on the morning of the 16th inst., in his 66th year. He was a native of Massachusetts, and for forty years an all-around railroad man. Twenty-five years ago he entered the service of the S. P. Co., and at his death was second vice-president and general manager of the entire system at a salary of $25,000 per year. Mr. Towne was a genial man, well liked by all; possessed unusual executive ability and so filled his high position as to command universal respect. He was conciliatory but firm, kept his promises and many times exerted his authority in favor of the numerous employes in whose interests he always had a genuine concern. He was of considerable service to the State in which he lived so long, and did much to advance its interests. He never ran to a fight nor from it and was honest and straightforward in his private friendships and his public duty.

G. F. Deetken.

G. F. Deetken died at his home in Placer county last Monday in the 60th year of his age. He was one of the best known miners in the State, his name being connected with the chlorination process of which he was one of the originators and among the first to make a success of in this State. He was a skilled metallurgist, and his many contributions to this paper have been copied into every mining journal in the world. The deceased was a native of Mosbach, Germany. He came here in 1853 and mined in the neighborhood of Grass Valley. For forty years he followed the business with varying success, spending large sums of money in experiments and improvements. Last August he was instrumental in organizing the Marguerite Gold Mining and Milling Co., which operates near Auburn, and since then has been acting as superintendent there.

The Trail Creek Country.

Written by CLARENCE KING.

Clarence King has spent considerable time in the Trail Creek country, B. C., and in a Chicago paper says that so far the more important mineral discoveries in that region are within British Columbia, but geological identity renders it almost certain that the slower and more thorough prospecting that always follows early discovery, will extend the valuable area well down into the State of Washington.

The points where profitable mines are already open lie within ten miles of the Columbia.

Access to the region is gained by the Canadian Pacific railway, which forms the northern boundary of the mining territory, and the Great Northern and Northern Pacific systems, which skirt its southern margin, besides several hundred miles of navigable waterways, including the Columbia river and its larger tributaries and several important lakes.

The Spokane Falls and Northern railroad enters the region from the south. In spite of all these avenues of communication and of several years of active mining development, the region remains in detail a half-known wilderness. In the eastern part of the province both the Selkirks and Rocky mountain range proper ascend to 12,000 feet, culminating in wild peaks covered with perpetual snow, their gorges choked with extensive glaciers, and their flanks covered with all but impenetrable forests.

The summer is short, the winter correspondingly long, and agriculture, except on the coast, is confined to rare sheltered spots and a few northern crops.

Over the British border and into this grim, difficult region American prospectors have poured during the short working season of the past five or six years with all their characteristic energy. In canoes they have threaded every lake and river. With axes they have hewed their way through tall coniferous forests which grew almost as dense as a canebreak. Not a snow ridge is so lofty or inaccessible but these hardy fellows have made their bivouacs by the sides of the glaciers and prospected literally above the clouds.

Although this is British territory, it is curious to note that nearly all the exploration and discovery is being done by American prospectors, and about all the development by American miners. The Columbian profits in various ways, but he stands dazed before the audacity and the knowledge of the mining adventurers from the States.

One who has followed the older districts for years constantly comes across familiar faces in Columbia cabins and by the side of mountain campfires. The same eager, imaginative, dauntless fellow you saw silver hunting a few years ago among the palms of the Mexican Sierras meets you now, toiling along on snowshoes over the low ridges of the north, keen for gold.

Thus far only a general prospecting reconnoisance in force has been accomplished for the whole region south of the Canadian Pacific railway, resulting in the discovery of many valuable and some brilliant mines. But it is already certain that the whole field described is one broad mineralized area. The chief points of demonstrated value are the district of Slocan in the East Kootenai division—where excellent silver-lead mines are being exploited, and where the two metals occur in unusually high percentages in veins, with every evidence of strong extension and permanency—and Trail Creek, in West Kootenai, six miles west of the Columbia and about ten north of the boundary. At both of these points towns are rapidly building and large permanent works of development are begun. It is the mines of Trail Creek, near Rosslaud, which for the moment are attracting the widest public interest from the fact that their veins carry an exceedingly rich and unique type of gold ore.

All these are strung along in a single belt of precious metal deposit, which extends from Alberta to the Pacific. They are the first fruits of the new campaign. Enough is already known to warrant the conclusion that the whole of the province is more or less mineralized.

As mentioned, the Slocan ores carry a higher percentage of lead and silver than those of any district in the United States, and are thus able, in spite of their remoteness, to compete in the smelting market of this country, paying the federal import duty and going as far as Kansas City.

Moreover, their abundance is of great importance, in view of the rapid exhaustion of the rich silver-lead deposits in the States. At the depressed value of silver and panic price of lead Slocan is till able to produce the two metals at a big profit.

The Trail Creek gold mines were discovered four years ago, but their regular development dates from 1893. Their mineralogical character is so peculiar that a few points of technical interest may be mentioned. From the Columbia river eastward extends a chain of ancient outbursts of a dark green, heavy, exceedingly hornblendic diorite, an irruptive rock oftener in other countries associated with occurrences of the precious metals.

These mountain masses of diorite are riven in several directions, but mainly on east and west lines, by a numerous series of fissure veins filled with a massive mixture of iron and copper sulphide carrying from one to three ounces of gold to the ton, from 5 to 10 per cent of copper, and a small varying amount of silver, usually less than ten ounces. The ore consists of pyrite, not often crystallized but usually in a solid, amorphous mass. As developed the vein shows great volume, and solid ore free from gangue and ranging from five to twelve feet in thickness.

When it is added that the ore chimneys, though not very long, are very frequent and near together, it will be realized that here are the elements of a new and extremely rich type of gold formation. Such ores are obviously out of the range of amalgamation processes, but are entirely suited to matting and smelting. The few hundred tons which have thus far been extracted, largely in the course of development, have been smelted in Butte and Helena, whither they go by the Spokane Falls and Northern and Northern Pacific roads. The smelting results show a remarkably uniform yield, which is found to average about $48 in gold and 6 per cent in copper. Nowhere else in America are there large, strong veins of this chemical nature. Such ores were heretofore rather a mineralogical curiosity.

Several admirable mines at Trail have passed the experimental stage, and are now realizing an important production.

Slocan and Trail have given such an impetus that this year's prospectors are extremely active, and already tales of new discovery are coming in from the front, and by autumn the known field will certainly be much extended.

The mining laws and regulations instituted by the provincial government are excellent in their liberality and wise provision. At first they followed our pernicious system and granted with each location extra-lateral rights to follow a vein on its dip under the surface of another proprietor, but they soon saw that it would be wiser to make mining laws for sound title than for the benefit of mining lawyers, and they repealed the act and substituted "square locations," the only safe basis of ownership.

The new towns are exceptionally orderly and decent. All miners are licensed from year to year at a fee of $5, the license being revoked for ill-behavior. An official called the gold commissioner has general oversight of the administrational phase of the mining industry, using his large powers to the great satisfaction of the mine proprietors.

British Columbia is a rich and permanent mining field which will always be chiefly operated by our countrymen. The physical conditions are novel and in some respects trying, but not enough so as to discourage or delay our race of miners, who are at home anywhere from the Yukon to Central America.

Mine Management on the Randt.

Geo. Starr, the manager of the New Primrose, a Johannesburg, South Africa, mine, gives some figures which illustrate the economical method of working gold ore in that region. The following is for the month of May:

MINING.—24,828 TONS.

	Per Ton. Shillings.
Mining	6.534
Developing (hand)	2.164
Developing (machine)	3.149
Pumping and hauling	1.580
Tramming (underground)	0.896
Tramming (surface)	0.229
Maintenance, etc.	0.708
Total	15.260

MILLING.—24,568 TONS.

	Shillings.
Crushing and sorting	0.230
Milling	1.618
Maintenance, etc.	0.166
Total	2.014

CYANIDING.—16,736 TONS.

	Shillings.
Filling and discharging	0.721
Labor	3.053
Maintenance	0.280
Total	4.054

The cyanide expenses are calculated upon the basis of 16,736 tons of tailings treated, being the product of 24,568 tons of ore milled, 30 per cent of the pulp being temporarily lost in slimes. To arrive at the actual cost per ton cyaniding bears to the quantity of ore reduced, the total expense for cyaniding, viz., £3395, is divided by the tonnage crushed, 24,568 tons. This gives a cost of 2.76s per ton. For the month the expenses at the New Primrose were, therefore, as follows:

	Per ton.
Mining	15.260s
Milling	2.014
Cyaniding	2.760
Total	20.034s

DURING the last five years the price of amber has been reduced nearly two-thirds. A new process of melting and molding it into shape has been adopted, where before it was cut from a solid mass. The molded amber is stated to be less brittle and far more durable than the cut amber, and in consequence is in greater demand. By the new process, it is claimed the amber can be molded into any form and there is no waste.

A Just and Dignified Protest.

At a special meeting of the Geographical Society of the Pacific last week the following memorial was ordered sent to the President:

To His Excellency Grover Cleveland, President of the United States:—Among the removals from the United States Coast and Geodetic Survey, just announced, is that of Professor George Davidson, for many years in charge of the Survey on the Pacific Coast.

The Geographical Society of the Pacific desires to enter a respectful protest against this removal. Professor Davidson is physically far more active than his years would lead those not acquainted with him to suppose. He is amply able to do duty in the field to-day, and his long experience and well-earned reputation in scientific circles render his services exceptionally valuable to the Coast Survey. Thoroughly familiar with the routine, he is fully qualified to carry on what yet remains to be done along this coast.

We consider it a grave mistake to remove him. One who could devote night after night to taking stellar observations for the United States Government in a cold, damp observatory, from 9 P. M. to 3 and 4 A. M., keeping this up for periods of sixty and seventy consecutive nights, and transact the daily office business of the Survey besides, as the Professor has frequently done within the past three years, can scarcely be called too old for duty. Many men who are twenty years younger than he is could not go through such a physical strain. In reducing the appropriation for his department Congress did not intend to dispense with his services.

As a recognition of his work for the advancement of science the Royal Geographical Society of London elected him an honorary member of their organization. In 1894 the French Government appointed him a corresponding member of the "Bureau Des Longitudes" of Paris. This honor has never before been conferred upon an officer of the United States Government. In both instances the action was a compliment to the American people.

And this society does, therefore, with a view to the benefit of the public service, respectfully ask that your Excellency take such action as may be necessary to restore Professor Davidson to his former position.

RALPH C. HARRISON,
IRVING M. SCOTT,
CHAS. L. TAYLOR,
JOHN PARTRIDGE, Secretary.

In this regard it is noted that our distinguished fellow citizen is not sitting supinely. He proposes to engage in active work as consulting engineer, and will doubtless have demands upon his services that will compensate, from a financial point of view, for any loss of Government position.

Professor Davidson's studies and work in irrigation projects have been wide. In 1873, he, together with General Alexander and Colonel Mendell, U. S. engineers, were appointed by the President Commissioners of Irrigation for California. They examined the entire Sacramento and San Joaquin valleys, traveling some few thousand miles to all tributary streams and reservoir sites. Their report was published by the Government. In 1875, by direction of the Government, he examined the great irrigation works and projects in India, Egypt and Italy. In India he visited twelve great systems upon the advice of the Viceroy, and brought home a great volume of plans, etc. He has kept himself informed of the progress made since. In Egypt he examined the valley of the Nile from the delta to the first cataract, at the request of the Khedive, who put his steamer and an engineer officer at his disposal. He made an unofficial report to the Khedive and killed some of the projects under discussion. In Italy he examined the great Canal Cavour and the drainage enterprises on the lower Po. His report on these examinations was published by the Government. Upon his return to California he delivered two lectures before the Legislature, at their invitation, upon the application of the principles he had learned to the conditions in this State. For private enterprises he has at various times since given much valuable expert testimony, notably in the "Desert Lands" case, and has made reports on many projects of magnitude, such as the Bear Valley Land and Water Co.'s projects in San Bernardino county, upon which report the money was obtained, and the San Luis Rey Water Co.'s project in San Diego county.

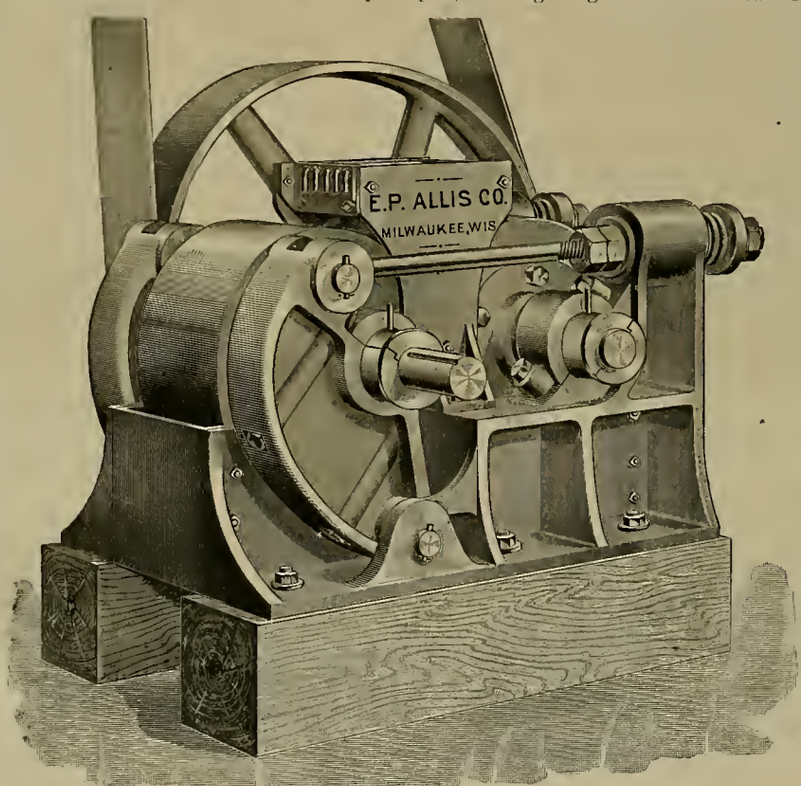
In harbor and river matters he has kept himself informed of the needs and the methods of relief through the necessity of gathering information for the four editions of his "Coast Pilot" of California, Oregon and Washington, and his "Coast Pilot" of Alaska, and knows what success has attended the efforts of the U. S. engineers.

SALARIES on the American liner "St. Louis" are: Master, $5000 a year; first mate, $1500; second mate, $1000; chief engineer, $250 a month; first assistant engineer, $125; second assistant, $100; third assistant, $84; seamen, firemen, waiters, etc., from $18 to $25. The ship's crew numbers 410, of which 200 are in the engineer's department.

The Sultepec Mining District.

TO THE EDITOR:—This district, one of the most important in the State of Mexico, is situated about 100 miles southwest from the City of Mexico, and is reached by the Mexican National R. R. to Toluca, the capital of the State, 45 miles; thence by a branch line to San Juan de las Huertas, 10 miles; and the balance of the distance, 45 miles, over a good pack trail, which will be made into a wagon road during the coming dry season. The chief town is Sultepec, elevation 7700 feet, with a population of about 4000. There is a tri-weekly mail, and telephone and telegraph connection with Toluca and the City of Mexico. In the neighborhood are a great many farms, and in consequence provisions are plentiful and cheap. The hills to the east and south of town are covered with oak and pine trees, suitable for mining timbers, fuel and charcoal. Cord wood is worth form $2.50 to $3.10 per cord, and charcoal from $5 to $5.60 per ton. These and following prices are in Mexican money, now worth a little more than one-half of a like sum in U. S. gold coin. There is a fair supply of good water at all seasons, and during six to eight months the smelters are run by water power.

Labor is abundant and cheap, miners receiving 50 cents and laborers 36 cents for a day of eleven hours. Much of the work is done by contract, at prices running from $5 to $10 per meter for tunnel or drift, and from $7 to $15 for sinking. Tunnels average 2 meters high by 1.75 meters wide; shafts about the same. In all cases the men furnish powder, caps, fuse and light, and handle the rock broken. As a general thing the ground is easy, being for the most part slate, though at times the vein matter is a very hard quartz. The present freight rate to the nearest railway station (San Juan de las Huertas) is $2 per carga of 300 pounds, or $13.65 per ton; but on completion of the wagon road it will be reduced to about $5 per ton. Some heavy freight has been hauled over the trail on wagons, but at considerable loss of time and money, owing to steep grades and sharp curves. The climate is delightful, and there are no mosquitoes or other noxious insects. Mining and smelting have been carried on in this district since before the time of Cortes, and to-day the inhabitants are engaged to a large extent in one or the other industry. In the early part of this century much of the ore was treated by the patio process, and over 800,000 ounces of silver were shipped to the mint in the City of Mexico in the four years and a half from 1803 to 1808. From the date of the independence of Mexico to the early eighties, a period of about sixty years, very little work was done in the district; but within the last ten or twelve years a new impetus has been given to the mining industry by the organizing of four companies, in which American, English and Spanish capital has been invested. These companies are known as the Sultepec Mining Company, the Hidalgo Smelting Company, Las Minas de "El Malacate," and El Fundo Minero de Sultepec. Of these, the first three have water-jacket smelters, with a combined capacity of 140 tons per 24 hours; while the last named makes use of four German stone furnaces, which treat about thirty tons daily. In addition to the plants mentioned, there are five other smelters in the neighborhood, viz.: La Providencia, Diego Sanchez, La Garapata, San Francisco, and Los Arcos. Los Arcos is owned by a German company and has been in continuous and successful operation since 1822.



The veins of this district may be divided into two classes, *i. e.*, those carrying galena in a quartz gangue, and those with no galena, but rich in silver, with calcite as gangue. The veins of the former class measure from five to sixty feet in width, with three to twelve feet of pay streak, and run northwest and southeast, and dip to the north at an angle of 50 to 75 degrees. The largest averages fifty feet, and has been worked to a depth of 100 to 300 feet, at intervals of four or five hundred feet, for more than three miles. With the galena are found iron pyrites, arsenical pyrites, blende, antimonial silver and argentite. The average value of the ore in the pay chimneys is 15 to 40 per cent in lead and 30 to 50 ounces in silver per ton; while between the chimneys a part of the lead is replaced by pyrites and the silver contents is reduced by 30 to 50 per cent, thus giving an ore with 5 to 10 per cent in lead and 15 to 25 ounces in silver. This latter grade ore does not pay to smelt under present conditions, and there are thousands of tons left standing, or thrown over the dump. By the erection of a concentrating plant all of this ore could be made available, and on a basis of handling fifty tons per day would yield a net profit of $6 to $8 per ton, or about $100,000 per year. There is now in sight more than enough ore to run for twenty years.

The veins with no galena are by no means so plentiful as those just mentioned, but are richer in silver, running from 50 to 200 ounces per ton. The average width is about a foot and the workings are extensive, though the greatest depth will not exceed 400 feet. As there is a difference in elevation of more than 1500 feet between the highest and lowest points on several veins, most of the work is carried on through tunnels, and at present writing there is not a single hoisting plant in the entire district.

Sultepec, Mexico, July 3, 1895. C.

The Reliance Crushing Rolls.

The accompanying cut illustrates a new type of crushing rolls for crushing ore, as built by The Edw. P. Allis Co., of Milwaukee, Wis., branch office, 9 Fremont street, San Francisco, Cal. The makers claim it is the most compact roll on the market and no other make can compare with it as regards fewness of parts. "The frame is constructed on scientific principles, securing the greatest possible strength with a minimum amount of iron. The journal boxes are made on the ball and socket principle to avoid any unequal strain on the bearings, which is a grave fault with rolls having rigid bearings. The adjustable roll is mounted on a swinging pillow block, the same being pivoted at the bottom and held in place at the top by tension rods, with springs and adjusting nuts as shown. This mode of construction is regarded by the best mill men as being highly advantageous over sliding boxes. The tension of the springs is adjustable, and by means of collar nuts the slapping together of the rolls is prevented."

THE RELIANCE CRUSHING ROLLS.

MEN are composed chiefly of charcoal and water. As beings of this composition cannot exist in any heat great enough to set the charcoal on fire in spite of the water, the scientists are now speculating as to the possibilities of the hot stars being inhabited by animals with silicon substituted for charcoal. Silicon is sand, or at least it bears much the same relation to sand that carbon does to charcoal.

THE longest American railroad tunnel is the Hoosac tunnel, on the Fitchburg Railroad, four and three-quarters miles. The St. Gothard tunnel in Europe is over nine miles long.

IT is estimated that over a quarter of a million workmen have benefited by the recent increase in wages. The average advance is about 12 per cent.

A LARGE aluminum plant has recently been completed at Oak Ridge, Mo. It will have a capacity of 100 tons of clay per day.

The Foremost Shipbuilders.

Under the heading of "Our Greatest Shipbuilder," the following is in a New York paper:

"Nobody would have picked him out for what he is—the greatest builder of ships this country has ever seen. He was walking in his soft, stooping way through the corridors of the Waldorf. He is small and dried up, and wrinkled and gray, and serious to look at and utterly insignificant and unimpressive in general. But when you look at him critically you can see sharpness, shrewdness, cleverness sticking out all over. I have seen him sit for days in the Senate gallery, watching as a cat watches a mouse, the progress of bills in which he had a business interest. Few men have had so strong a "pull" with the Government, and with Congress. His influence is felt, but seldom seen. He is far too shrewd to make mistakes. But he also builds good ships. He builds bigger and better ships than anybody else in the United States could build, and the Government finds him and his shipyard a necessity. He is worth millions. The name of William Cramp will long live in history."

The Salt Lake *Tribune* comments as follows:

"Not so fast, please. Maybe the Pacific coast has something to say about that. The Union Iron Works, at the head of which is Mr. Irving Scott of San Francisco, has the best equipment for building ships in America. That company has built as large ships as any other company in America, and in some respects the performances of those ships are more satisfactory than any built on the Atlantic. For instance, the Cramps built a ship which was a sister cruiser to the "San Francisco." It made a little trip down the coast and back, and had so much water in the hold that it had to go to the dock to be repaired. The Union Iron Works built the "San Francisco." It sailed down through the Straits of Magellan and up to New York, and the hold of the ship was perfectly dry. On reaching New York the commander of the ship was asked by the Secretary of War how long before his ship would be ready to proceed to sea, and he answered: "She will be ready as soon as the water can be heated in the boilers." The Union Iron Works has not yet had the chance to build a great passenger steamer like the "St. Louis," but they are all ready to take a contract of that kind, and are perfectly confident of their success if a contract is ever given them, because some of the finest small passenger ships afloat have been turned out from that yard. The Cramps are good shipbuilders, but in our honest judgment the men in charge of the Union Iron Works of San Francisco are as much superior to the Cramps as the Pacific is superior to the Atlantic.

Elements of Motion.

There is no force in matter. All force is the tendency of every particle of matter to establish and maintain itself in the most agreeable relations to every other particle of matter. An ancient and not improbable conception of matter is that, in its rudimentary state, it consists of but two constituents, or of one radical in two states, corresponding to positive and negative. All substance is referred to one or two rudiments. Elements are such compounds as are at present irreducible. They are composed of the rudiments in various forms of combinations and recombinations. Atoms are the theoretically indivisible particles of the rudiments. Elementary atoms are the practically indivisible and inseparable particles of the elements. Molecules are the smallest parts into which any substance may be divided and yet retain its individual properties. There is no matter without properties; properties are things; there are things which are not matter; attraction is a thing which is not matter, but a property of matter. There is no thing, not even an imaginary line, that is disassociated from matter. Gravity is the inclination of every particle of matter to approach every other part of matter. Cohesion is the tendency of particles to cling to particles of the same substance with which they are in immediate contact. Expansion is the occupation, by particles, of more than their original space. Contraction is the occupation of less space. All forces are antagonistic; the triumph of one is the subjugation of the other. Motion results from the conflict of forces; when one overpowers another, movement ensues. All mechanical movements may be traced to these general principles.

WHEN the gulf stream passes out of the Gulf of Mexico, its temperature is about 70° Fahr.

Pithecanthropus Erectus.

Written for the MINING AND SCIENTIFIC PRESS by W. E. ROTZELL, M. D., Narberth, Pennsylvania.

Anything new relating to man, his origin, history, or characteristics, is always received with pleasure; and it is now that anthropologists are intensely interested in the discovery of the remains of a new form that from present evidence seems to meet the requirements of a "missing link" between man and the lower animals more closely than any remains hitherto found.

The earliest remains of man, as is well known, have been found in Europe only, they being those of Neanderthal, Spy, Naulette, Shipka, etc., but now remains more primitive than any of these are reported from the island of Java. This discovery adds greatly to our knowledge of early man, especially to his geographical range.

Dr. Eugene Dubois, in a memoir issued from Batavia, Java, describes these remains as being found near a river at a depth of from twelve to fifteen meters below the surface, in a sedimentary bed of material of volcanic origin, of Plistocene age. It is impossible to estimate the exact age of this stratum, since the question involves many geological points that are not as yet decided.

The remains consist of a calvarium, including a portion of the occiput, and the supra-orbital ridges; a third upper molar; and a femur. The skull and tooth were found associated, while the femur was found fifty feet distant, and possibly may be in doubt. The skull is somewhat similar to those of Neanderthal and Spy, but the walls are not as thick as those of the former, resembling more closely those of the latter.

The cranial capacity of the Java skull is just midway between that of the gorilla and the lowest normal of man. The cranial capacity of the gorilla is 500 c. c. m. In the Java skull the capacity is 1000 c. c. m., and in man the cranial capacity is 1500 c. c. m. The tooth was found close to the skull, and is the last upper molar; it has widely divergent roots, the crowu is large, with the cusps not clearly differentiated, as in the anthropoids and the inferior races of man. The femur resembles that of the man of to-day and indicates that the creature walked in an upright position, just as man, and this fact certainly indicates that it cannot be considered as belonging to any species of ape.

Dr. Dubois not only considers this form to be a new species, but also a new genus and a new family, placing it between the *Simiadæ* and the *Hominidæ*. The name given to this being by Dubois is *Pithecanthropus erectus*, which means "a monkey man standing upright."

If. after this matter has been carefully weighed by science, it is decided that man's advent into the world occurred in the region of Java, previous theories regarding his place of origin will be shown to have been incorrect. Scientists have looked for the origin of the race in southern Europe and in Africa, where man's nearest relations among the lower animals still exist.

The Mineral Lands of the State.

TO THE EDITOR:—An attempt is being made to take the settlement of the mineral land to the courts.

That would certainly be very acceptable to the railroad company; it would then be settled like most of the large estates are in California. The heirs get the decision, but nothing else. In this case the miners would get the decision and the R. R. Co. the land. It would all be sold in large tracts years before the courts would settle it.

The courts are a city of refuge for this corporation. What has been said about settling this mineral and agricultural land dispute originates with the R. R. Co.

The Supreme Court of the United States has already decided that mineral land was not included in the railroad grant. But the Land Department persistently refuses to provide any way for the miners to prove what is mineral land. If the Secretary of the Interior understands what kind of land is being patented to the R. R. Co., it is certainly a surprising state of affairs. It leaves no land that can be called mineral. There can be question honestly raised in regard to nine-tenths of this disputed land now being patented in northern California. All the information to be obtained from the Land Department at Washington would lead us to believe that they regard the mountains of northern California as being as level as the plains of Kansas. They were certainly educated in a school where geography was omitted from the course of study. Many of the sections are so remote in the mountains that it would require $5000 to build a passable road to them, and, when built, not one acre of land suitable for farming could be found. And it is a well-known mineral region. Some might say, "Why not file a mineral affidavit and contest?" It is expensive to contest a section. You must be well acquainted with each of the smallest legal subdivisions. The existence of mineral on each must be proven, and mineral in paying quantities. You must meet a lot of fixed questions, which it is impossible to answer, that are kept as stock in trade by the R. R. lawyers.

Must the miner conclude that about all mineral land is going to be patented to the railroad company without considering right or law? Such a conclusion would not be inconsistent with the facts. The miners are loyal citizens of this republic. They pay taxes and obey the law, and why our officers in authority allow them to be plundered by this railroad corporation, I suppose, cannot be found out. Such things are not permitted under any monarchial government on earth.

The railroad officials are writiug letters and having them published where they think they will do the most good, in which they deny their right to the very kind of land they are patenting under the rulings of the U. S. Land Department. The miner must stand idly by and see the double dealings going on which rob him of his rights. Of all the corporation steals of the peoples' property, none have been more iugeniously and cunningly planned than this mineral land steal. It has taken years to consummate it, and make the miner believe he has a chance to save what belongs to him, when no such chance exists

The railroad officials display excellent judgment in selecting the best mineral land there is up this way. The selections are made in the most rugged and broken mountains where mineral is most likely to be found.

Justice is certaiuly dead!

Shasta, July 12th, 1895. JOSEPH E. BELL.

Exporting American Ore.

On a few occasions in recent years the United States carried coal to Newcastle, and now it has started to export iron ore to the great ore-producing countries of Europe. According to the *Iron Age*, of New York, some shipments of ore have been made to the European markets, which that paper says are the first in the history of the American iron trade. This does not mean that iron ore in general can be produced here as cheaply as it can on the other side of the Atlantic, and that this country can hereafter meet the competition of the outside world without asking any favors at the custom house. The higher cost of labor in this country more thau offsets such advantages as are on the side of the American iron producer.

The ore which is at present being shipped is to meet a demand in Germany, England and other countries in Europe, but particularly in Germany, for ores which are high in phosphorus. At present Germany is paying an extra price for ores of this class. Some of the German demand, which has been growing rapidly in recent years, has been met in England and Sweden, but the American ore which is now being shipped is more suitable for the purpose and commands a higher premium. This ore was mined near Lake Champlain, in which locality, it is said, the deposits are richer in phosphorus than those of any other part of the United States. It is shipped on canal boats from Port Henry, N. Y., to New York and transferred to the European steamers.

Shipments of ore to England, it is expected, will soon reach the proportions of those to Germany. The ore which is to go to England is a special variety for basic open-hearth purposes. It is probable that a large market for these special grades will be found in Europe. At present the exportation is aided by the general lack of freight to Europe and the consequent lowering of rates, which gives the American shipper an advantage that he will lose a few months hence when the regular traffic increases. It appears to be the intention, however, to provide boats especially built for this sort of freight, and in that event the low rates will remain. The point of particular interest is that the United States is constantly reaching out for new markets for its products and finding new avenues for the employment of its activities.

Coast Industrial Notes.

—The first shovelful of earth was turned last Tbursday at Stockton on the construction of the Valley road.

—The steamer Bawnmore goes to Portland, Or., from Paytu, Peru, via this city, with crude oil for the Portland Gas Company.

—Mariposa county has voted favorahly upon the proposition to issue $15,000 honds to huild a road between Coulterville and Mariposa.

—Oakland men have patented a process for refining California oils, which is claimed to furnish clear, clean oil which burns without smoke or odor.

—D. O. Mills is credited with intention to extend the Carson & Colorado to Mohave within two years and make the road a standard guage throughout.

—Stockton men are about to engage in the manufacture there of tartaric acid and cream of tartar from the sediment and dregs of wine casks, which is in abundance here.

—The lateral canal north of Amsterdam, Merced Co., is completed. It taps the main canal eight miles northwest of Yosemite lake, is seven miles in length, five feet deep and fourteen feet wide on the bottom.

—Blue Canyon, Wash., coal will be used hy the Great Northern Railroad Company on the Cascade division. This, in conjunction with the contract awarded by the United States Government for 3000 tons a month, will necessitate an increase of operatives from 80 to 100 men.

—British Columbia will soon he shipping her salmon all the way to England in paper. Cans made of paper pulp are being introduced to take the place of tin cans for containing all kinds of preserved produce. The salmon pack this year will he a large one, possibily about 450,000 cases.

—The Cumherland coal trust in this city which advanced the price of Cumherland coal from $13 to $13.50 a ton received a serious check last week by the arrival of the Washtenaw which had 2000 tons ahoard consigned to P. B. Cornwall. After its arrival San Francisco hlacksmiths were ahle to get Cumherland coal for $8 a ton.

—The Fair Oaks and Orangevale Railroad Company has incorporated in Sacramento to huild an electric railway between that city and Orangevale, a distance of twenty miles. Power will be secured from the canal at Folsom. The road will he for hoth freight and passenger traffic. Capital stock, $500,000. Directors, L. T. Hatfield, T. B. Hall, G. M. Mott, William Schaw and F. E. Cox, of Sacramento.

—There is a general movement among the merchants, manufacturers and producers of this city to secure a more extended market for home manufactures, yet, with singular obtuseness, the "Lahor Unions" of this city frown on the effort and the "Lahor Council" decides to take no part in tbe movement. Of all peoples they are most interested, for its success means their gain greater than any other class.

—Several prominent men have organized a company to manufacture and introduce a mixture of peat and asphaltum for fuel. A large tract of peat land has been hought in the San Joaquin valley; asphaltum deposits have been secured in Ventura county, and the company proposes as a starter to build in this city a small 100-tons-a-day plant, and introduce the new fuel, which, they say, can he furnished the consumer for $2.50 per ton.

—Nearly every interior paper in the State, commenting on the success of the great Folsom-Sacramento electric power transmission scheme, points out that water power in the vicinity of the place where the paper is published exists in sufficient quantity to warrant the erection of similar plants should capital decide that the enterprise would he a paying one. This is one of the cases where the supply first creates tbe demand, and then regulates it.

—Rate cutting is on again north and south of San Francisco The opposition steamers hetween Columbia river and Puget Sound ports bave again forced the larger corporations to make special rates to Portland, Astoria, Seattle and Tacoma. One dollar per ton is charged for freight to these points, and passenger rates have again dropped to $10 to Puget Sound points, first-class, and $8 to Portland and Astoria. The steamer Washtenaw is advertised to sail for Panama direct, in opposition to Pacific Mail.

—Since the English company paid $300,000 for the Iron Mountain property in Shasta county, it has been a question as to the building of a railroad and smelter, which has heen decided in the affirmative. It is announced that a smelter with a capacity of 1000 tons per day will be huilt five miles from Redding, and that a survey has heen agreed upon for a road from the mine. This means a good deal to that section of the State, and if the plan outlined is pushed to successful completion, it will he a matter of mutual profit to all.

—A complete electric plant has been established hy Wm. Sutton, in Euculet district, Barclay sound. The greatest difficulty which the lumhermen there have to contend with is transporting the trees, after they have been felled, to the water. Once afloat, it is easy to handle them. Dependence has had to he placed hitherto on teams of mules or horses, or on steam power, when the services of a portable engine could he hrought into use, and in the Barclay sound region it has heen a source of great trouhle and expense to transport and operate even the portable engines.

—There are ten oil-hurning engines in service on the Southern California railway, Santa Fe system, equipped with the Booth hurner and combination oil and water tank. The oil tank is enclosed in the water tank and is surrounded by water. The reservoir holds 1750 gallons of oil and the water reservoir holds 3900 gallons or ahout fifteen tons of water. The oil tanks are provided with safety valves which close automatically. The engine used in passenger service has 18x24-inch cylinders, with wheels 62 inches over all, and makes the round trip of 265 miles without taking oil.

—Fuel petroleum is now delivered here for $1.50 per barrel of forty-two gallons, which is an equivalent to coal at $4.50 per ton. There are nearly 300,000 harrels of crude petroleum stored in Ventura and Los Angeles counties. The Union Oil Company of Ventura county has twenty miles of main pipe line with over eighty miles of feeders, leading to the sea at Ventura, and the Pacific Coast Oil Company is huilding forty miles from the Newhall or Pico district to Ventura. The latter company has in the course of construction at the Union Iron Works an oil steamer of 6000 harrels capacity to transport their own production to their refinery at Alameda.

—Mr. Meade, the active secretary of the Manufacturers' Association, has inquiry regarding the feasibility of a bicycle factory here. The hicycle makers cannot keep up with the demand, which is not like some new "fad" or "craze" for some new thing, which hurns like straw in fierce but fading flame. It gives promise of permanency. The State is sending hundreds of thousands of dollars away for wheels, and in the line of assistance to home industries it is believed that a good California-made bicycle would sell well, and a bicycle factory be a paying institution. In response to a letter from Mr. Meade, offers of sites, etc., have heen received.

—The concession granted several years ago to the Maritime Canal Company hy tbe Nicaraguan Government for the construction of the Nicaraguan canal is for the second time in great danger of heing cancelled, and if annulled this second time will be otherwise disposed of. The Nicaraguan Canal Company will he notified soon that the Nicaraguan Government will hold them to their original proposition and the canal at Tipitapa must be constructed and completed within a short period. In this they are firm, and should the canal company either refuse or neglect to carry out the original plan, the concession will be annulled finally. It is generally understood in Managua that if the work is not hegun very shortly, or if the canal company does not take almost immediate steps to convince the administration that the Tipitapa canal will he constructed, the next meeting of Congress of Nicaragua will ratify the cancellation of the concession, which Minister Gomez would not hesitate to hring ahout.

Scientific Progress.

Self-Induction in an Electric Wire.

A phenomenon which embarrasses the practical electrician in many ways, but especially in telegraphy and telephony, is called self-induction. Each time the flow of a current is stopped or started a certain lag, is produced as if by inertia. This is exceedingly short in point of time; and its extent depends somewhat on the size and length of the conductor and some other circumstances. So long as the current continues to flow in one direction there is no difficulty of this kind; but it is as if a certain momentum had to be acquired or overcome each time the circuit is closed or opened. Hence, in sending messages over an ocean cable, the speed with which the letters are formed by interrupting and restoring the current, no matter by what code of signals, is limited by this tendency to blur, in consequence of self-induction. The same trouble is encountered in long-distance telephony, and is an absolute barrier to this form of communication under the Atlantic ocean. Now that alternating currents for light and power are coming into such extensive use, the phenomenon manifests itself in another way. A certain amount of voltage is wasted in overcoming the induction of the line. In the first two uses of electricity here mentioned the effect which is chiefly lamented is impairment of efficiency; in the latter two it is the economical phase of the subject which attracts the most attention. Both considerations have incited efforts to obviate, or at least to lessen, this evil.

Self-induction itself seems to result from the resistance offered, by the dry air or insulating coat surrounding a wire, to the progress of the iuvisible rings of force which encircle a conductor and move forward when an electric current flows. That resistance once overcome, all goes well until the current ceases, when a corresponding change occurs in the surrounding non-conductor or "dialectric." Now, if a frequently interrupted and restored current be led back through a second wire parallel with the first, but insulated therefrom, a fresh set of effects, occurring simultaneously and showing about the same intensity, but always in the reverse direction from those produced by the other wire, will be developed in the dialectric; and if the two conductors are placed pretty close together the one set of impulses will be partially offset by the other. Experience having shown that self-induction could be lessened in this manner, some one conceived the idea of making the supply and return wires eccentric; that is, one formed as a shell outside the other, but separated from it by a layer of insulating material. This is a more costly arrangement than laying two wires parallel to one another, no doubt, but it is expected to prove more efficient. Tests recently made by Professor Guye, with the concentric conductors employed in connection with an electric lighting plant in Geneva, Switzerland, tend to confirm this belief. Using the core for a "lead" and the shell for a return, he found that the voltage of a high-tension alternating current would not show any greater drop in a given distance than a continuous current would.

Dynamo and Steam Engine Efficiency.

Prof. Unwin complained, in a recent lecture, that electrical engineers were in the habit of comparing the efficiency of the dynamo with that of the steam engine, greatly to the discredit of the latter. It is a common saying, he adds, that the efficiency of a dynamo is from 90 to 95 per cent, while that of the steam engine is only about 10 per cent; but this comparisou is an unfair one, and shows a lack of comprehension of one of the two fundamental laws of thermodynamics, namely, the law of the motivity of heat. Heat energy is undirected energy, and only a fraction of it is convertible into mechanical energy. Working, as it must, with only this available fraction, the steam engine is not an inefficient machiue. The task of the dynamo is simpler. Electricity is directed energy in a wholly convertible form, and it is therefore only necessary to transform one kind of directed energy into another. In order to do this, only a small fraction need be wasted.

"Running Slow" of the Earth.

Lord Kelvin estimates that the "running slow" of the earth in its daily rotation round its axis amounts to twenty-two seconds per century. The main cause of this retardation is the friction caused by the tides, which act as a brake, the action of which has been calculated by this eminent physicist to be equal to a weight of 4,000,000 tons applied on the equator. Other causes have also to be taken into account, as, for example, the increase in the size of the earth, due to the falling on it of meteoric dust, which, if deposited at the rate of one foot in 4,000 years, would produce the observed retardation by itself. Such a phenomenon as the annual growth and melting of snow and ice at the poles is capable of introducing irregularities into the problem, the growth at the poles, by abstracting the water from the other part of the ocean, accelerating the earth's motion, and the melting, by restoring the water, retarding it. Against the retarding forces there has to be taken into account a probable acceleration, due to the general shrinking of the earth by cooling; but this Lord Kelvin believes to be very small—perhaps not more than 1-6000th part of the retardation due to the tidal friction. Professor Newcomb has declared, from astronomical considerations, that the earth went slow and lost seven seconds between 1850 and 1862, and then went fast and gained eight seconds between 1862 and 1872, changes of rate explicable by possible changes in the earth's shape, so slight as to be quite undiscoverable in astronomical observations.

THE *Times-Herald* of Chicago has first used the telautograph in furnishing press dispatches. That paper recently published photographic fac-similes of a number of messages iu the identical handwriting of the author, sent to it the previous night from prominent men who were in attendance at the League Convention at Cleveland. The test was successful. The instrument worked perfectly over a circuit 430 miles long. The ordinary telegraph circuit is only about 500 or 600 miles, automatic repeaters being used where the distance is greater. No repeaters were used in the *Times-Herald* test between Cleveland and Chicago, and the work of the instrument was a surprise, even to those connected with it. The longest trial heretofore given the telautograph was between Paris and London, the test being a private one. When Prof. Gray first conceived the idea of the telautograph, it is said, he had no idea of ever using it for long-distance work.

THE intensity of starlight can now be measured so accurately with electrical devices that this system is fairly comparable with the other methods. Indeed, with stars of the first and second magnitudes, it is not necessary to use even a telescope. The apparatus employed consists of a clean bit of aluminum, coated with selenium, and dipped into venanthol. A galvanic cell is thus created, aud the fluctuation in the current produced, or rather the square of the potential developed, is proportional to the light.

A FRENCH PHOTOGRAPHER has arranged an alcohol lamp so that, while it is immersed, he can throw powdered magnesium into the flame and thus secure a very brilliant light under water. In this manner he has been able to obtain some clear and beautiful photographs of the bed of the Mediterranean. Oxygen is carried down in the apparatus to promote combustion.

Mechanical Progress.

Long-Distance Power.

There are two remarkably long-distance transmissions of power in successful operation in the United States, although neither are electric transmissions and each differs materially from the other. One is the transmission of oil by pipe line from the natural fields of New York, Ohio and Pennsylvania to tide water, a distance of over 400 miles. The other is the transmission of natural gas, also by pipe line, from the Indiana fields to the city of Chicago, a distance of about 120 miles.

The piping of oil, first from the individual oil wells to storage centers, and then from these storage centers to tide water, has been a process of gradual development for the last thirty years. The individual wells were gradually connected by feed pipes to larger trunk lines, which carry the oil to the storage centers.

There are twelve pumping stations along this line, situated about thirty-five miles apart. The pumps operate at a pressure of about 1000 pounds per square inch, and the capacity of the line is about 30,000 barrels a day.

The main pipe line is divided into divisions and sections, much like a trunk railway system, and has, similarly, its division superintendents and engineers, section foremen, line gangs and line walkers, telegraph stations and daily reports.

The natural gas pipe line is, perhaps, a more simple example of long-distance power transmissions, and bears many striking points of resemblance to transmission by electricity. In the Indiana gas field about sixty wells are in operation, having an average daily capacity of about 5,000,000 cubic feet each. As in the oil fields, so here, the individual wells are connected by feed pipes to a supply line, which collects the gas and carries it to a pumping station. There large compressors, capable of producing and sustaining a pressure of 200 pounds per square inch, force the gas into the transmission line to Chicago. The normal pressure carried on this line is 300 pounds per square inch, which admits of a daily delivery of from 10,000,000 to 12,000,000 cubic feet of gas in Chicago, where it is sold at a price much below that of ordinary illuminating gas.—Cassier's Magazine.

Vehicle Motor Race.

A prize of $5,000 is offered by the Chicago *Times-Herald* for the successful competitors in a horseless carriage or vehicle motor race between Milwaukee and Chicago. The date of the contest will be about the 1st of next November.

First prize, $2,000 and a gold medal, the same being open to competition to the world.

Second prize, $1,500, with the stipulation that in the event the first prize is awarded to a vehicle of foreign invention or manufacture this prize shall go to the most successful American competitor.

Third prize, $1,000.

Fourth prize, $500.

The third and fourth prizes are open to all competitors, foreign and American.

Machinery and Men.

Mechanical establishments that are up to date are the only ones that will be able to stay in the field. Competition has been forced to so fine a point that the manufacturer, who would do any work at all, must figure every element of production cost down to the lowest possible notch. This he can do only with all the instrumentalities used by those with whom he competes. His competitors use the latest labor-saving, power-saving, time-saving and quality-raising machines, methods and processes, and if he attempts to get along without just as full an equipment, and of just as high a grade, he at the start places himself in a position or a condition that makes his defeat inevitable.

When is an establishment up to date? When there is in it no necessity for doing work twice, no necessity for using power to move a piece of metal in any other than a direct way from start to finish, no machine that is inferior to any other machine of its class, no part of equipment that causes constant wastage, however small, of fuel or steam, and no lack of the best machines to do easily and without abusive forcing all work that comes. Along with this up-to-dateness in equipment must go an equal to-dateness in the force of men employed. The finest machines are the cheapest in the end, providing they are used by the best of workmen. The shop in which first-class machinery is matched with first-class men is the only shop that can and will turn out satisfactory work.—Gazette.

Trials of a 320-Horse Power Gas Engine Using Power Gas.

The gas engine was of the Simplex type made by Matter & Co., of Rouen, and was used to drive the Pantiu mills.

The gas in this installation was made in producers of the Buire-Lencauchez system. The author states that with gas made in these producers this engine has given 320 I. H. P., whereas with ordinary lighting gas the I. H. P. would rise to 450.

The cooling arrangements were such as to enable the engiue to run continuously, and the trials in question lasted some 194 hours. During this time, 19 tons 15 cwt. 2 qr. of rough coal were consumed in the gas producers. The engine was, during the trial, driving the milling machinery, and by care a constant load was obtained corresponding to a mean I. H. P. of 280. This gives a consumption of fuel of 0.81 pounds per I. H. P. The quantity of circulatiug water needed was 1340 gallons per hour in the water jackets, and 660 gallons in the gas washers; in all 7.15 gallons per I. H. P. hour.

The trial was repeated after an interval of three months, and the figures obtained were practically the same.

The author concludes: first, that the quantity of gas produced per pound of coal varies from 64 cubic feet to a maximum of 80 cubic feet; second, that the calorific power of the gas varies between 34 and 42 calories per cubic foot, whatever coal be used; third, that the best and most economical explosive mixture corresponds to the consumption of from 50 to 70 cubic feet of this gas per I. H. P.—L'Industrie Electrique.

The Seasoning of Stone.

Stone, like lumber, requires seasoning. Stone is often spoken of as the synonym of solidity—"as solid as a rock," we say—but, as a matter of fact, stone is very far from being solid. A cubic foot of the most compact granite, for instance, weighs about 164 pounds, while a cubic foot of iron weighs 464 pounds. This plainly shows that in between the atoms which compose the mass of the most enduring stone there exists much space for air, moisture, etc. This seasoning of stone prior to use for building purposes has been well understood by the architects of all ages, but in the modern rush of nineteenth century building too little attention has been paid to it. Now it enters into the calculations of every good architect.—Scientific American.

ACIDS in lubricating oils may be detected by putting the samples to be tested in a clear glass bottle with a copper wire running down through the cork, air tight. Stand the bottle in a sunny place and leave for two or three weeks. If on removal verdigris or green rust is on the copper, there is an acid in the oil.

AN Austrian engineer, Herr Pfister, declares that the salt may be removed from ocean water by forcing it through wood in the direction of the fibers, under a pressure of twenty-three to thirty-eight pounds to the inch.

Electrical Progress.

The Folsom Power Transmission Plant.

Long distance transmission of electric power got great advancement during the week. The Folsom Water Power Co. has demonstrated the success of the scheme to generate electrical power at Folsom, in this State, and transmit it to Sacramento, the State capital, twenty miles distant. Last Saturday morning the power was turned on successfully. The breaking of the quadrant on the governor of the turbine wheel at Folsom delayed the movement of the machinery at Sacramento, but that is only a matter of detail and can readily be remedied. The fact of the successful transmission of electrical power over the longest line in the world was the main point. It is expected hy those in charge that hy the 1st of August the entire capacity of the 4000 H. P. can he utilized. For thirty years the scheme of utilizing the fall of the American river near Folsom had been in the minds of many, hut since the general application of electricity the original idea was augmented. In May, 1888, the directors of the State prison, on hehalf of the State, made an agreement with the company, the State to furnish the labor uecessary to huild the canal, dam, power house and electric work for the prison, and to receive in return the use of the first five feet fall of the water, the equivalent of several hundred horse power. The power house and electrical plant at the prison is State property. The plant with seventy feet fall of water at Folsom, two miles helow the prison, belongs to the company.

The dam is built of granite laid in Portland cement; is 650 feet long, 89 feet high iu the center, 87 feet wide at the hase, 25 feet wide on top, and is provided with a wooden shutter or flashhoard six feet high, which at high water is lowered into a recess in the crest of the dam. At low water this shutter is raised by hydraulic pistons, the depth of the hasin is increased by six feet and additional storage capacity for the waste water provided. Normally the dam forms a storage basin or reservoir three and one-half miles long and has a capacity of 13,000,000 cubic yards of water. At each side are head gates operated by hydraulic machinery, each 16 feet wide.

The west side canal is 40 feet wide at the top, 30 feet wide at the bottom and six feet deep.

The east side canal is 50 feet wide at the top, 40 feet wide at the bottom and eight feet deep, having a capacity of ahout 87,000 cubic feet of water per minute. The canal, divided into three sections, follows the hank of the river for about two miles, and is constructed partly of masonry, partly in deep solid rock cuts and partly by earth cuts and fills.

The power house is on the west side of Folsom. Here the canal widens into a forhay, 150 feet long, 100 wide and 12 feet deep. It is divided into two parts by a wall provided with suitable gates, so that one side may be cleaned out while the other is in operation. At the lower end of each section of the bay a sluicing gate connects with the lower river by a sluicing canal, and through these the sand and dehris is carried away and kept from the wheels, of which there are four pairs, each pair having a capacity of 1260 H. P. at 300 revolutions per minute, operated under a head of 55 feet. The water, after having passed the turbines, will be discharged through tunnels under the power house into irrigation canals.

Each of the four generators has a capacity of 1000 H. P. They are the largest three-phase generators in use. The wheels and generators are on the first floor of the building, sixteen feet above the level of the water in the tail race. The water wheel regulators are in the dynamo room, the operator having full control of the hydraulic machinery in sight of the electrical instruments on the switchhoard.

The hydraulic part of this plant was furnished hy the Morgan Smith Iron Works, of York, Pa., under contract with the Pelton Water Wheel Compauy of this city, and consists of four pair of 30-inch McCormick turhines of 1260 H. P. capacity each. The wheels run under a head of 55 feet at 300 revolutions and are direct connected to the armature shafts of the generators by insulated couplings. The inlet pipes are 8 feet diameter and made of ⅝-inch steel with double draft tuhes.

Each pair of wheels is furnished with a steel fly-wheel ten feet in diameter, weighing 10,000 pounds, having a peripheral speed of 9425 feet per minute. To provide for the centrifugal strain that such a high velocity gives, heavy tires are shrunk on to the rims. The exciters are run by two special wheels of a size to give them the proper speed, which are also direct connected as in the case of the larger wheels. The governors are of the Feasch-Picard type, the same as are used on the Niagara wheels, and heing located in the generator room are convenient for ohservation and control.

The wheel buckets are made of phosphor hronze, and the work throughout embraces the latest and most improved practice iu hydraulics. The wheels and accessories weigh upward of 400,000 pounds, and the plant, as a whole, is the most massive and powerful in the world, with the single exception of that at Niagara.

The sub-station step-up transformers are in the second story of the power house. In them the voltage, generated at 800 volts, will be raised to 11,000.

The pole line is double from the Folsom power house to the Sacramento transformer sub-station. Each circuit consists of three bare copper wires supported on double petticoated porcelain insulators. Iu the transformer room the transformer switch-boards receive the terminals of the 10,000-volt transmission lines and operate the different combinations of the transformers.

In the main room are three 300-horse power three-phase synchronous motors directly connected to a line shaft, which is provided with clutch pulleys and will drive several 500-volt continuous current railway generators and a numher of arc dynamos.

Of the power created, it is figured that ten per cent is lost in transmission to Sacramento, auother ten per cent at the Capitol City, making 80 per cent available. The Folsom plant generates electrical impulse available for light, heat or power. The success of this enterprise will result in numerous other projects of a similar character in various parts of the State being now pushed to practical completion.

Effective Electric Lighting.

In the early days of electric lighting people were apt to think a great deal more of the mere fact of using an electric lamp than of the actual efficiency of the light given by it. Nowadays, however, the consumer is probahly perfectly able to tell whether he is getting full value in light for the money he is paying the central station; and between the strict exaction of the consumer aud the competition of rival lighting systems, the electric light company can only hope to succeed by the hest service. Much attention has been drawn of late to obtaining the most desirable results from different methods of lighting, and the suhject has been hrought down to two main considerations—reflection and diffusion. In factories and large shops it is likely that the old practice of allowing the light of the arc lamp to fall downward will be discarded. It is found that hy inverting the lamp and throwing the light to the roof—preferahly of white—by a powerful reflector, the rays are so diffused throughout the building as to give the maximum efficiency without straining the eyes of the workmen. The prevailing methods in outdoor lighting, too, are condemned as crude and unscientific. The present street arc lamps dazzle the eye, throw sharp shadows and waste light. The next improvement in street lighting will probahly he to use lower candle-power lamps, placing them proportionally nearer together, at, say, the height of an ordinary gas lamp, using suitahle reflecting hoods, and making the bottom half of the globe semi-opaque, and possibly tinting it a deep orange color, ohviating the present glare. For incandescent lamps a luminous enamel is now used which entirely hides the filament, and at the same time disperses the light thoroughly. The enamel is made in various colors, but the white is to be preferred for general purposes. In domestic lighting, dioptric shades, having prismatic corrugations on their surfaces, are coming into vogue. They give a good diffusion of light with little absorption, and when made of either plain or tinted glass have a brilliant effect. In decorative lighting many new ideas have sprung up in the distribution of masses of light in interiors, but none have yet superseded in beauty and effectiveuess the system introduced last year of putting the lamps out of sight and lighting the room entirely hy diffused and possihly colored light. This will probably be the method of illuminating churches in the future. In churches where it has already been adopted the effect is described as so infinitely restful and appropriate that, in comparison, the ordinary methods of church lighting seem garish and barharous.

Fresno's Electric Transmission Project.

The Folsom-Sacramento electric transmission success starts similar schemes in several sections of the State. A Fresno corporation has contracted for three 450-H. P. tri-phase dynamos with alternating currents to be ready for use December 1, 1895, to supply light and power to that city. Like the Niagara and Folsom propositions, water will furnish the original motive power. It will be taken from a point six miles above the mouth of the north fork of the San Joaquin river, whence a canal will lead it along the summit of a ridge to a point 1410 feet above the river bed, where a reservoir covering eight acres has been huilt. The water will he piped from this reservoir to the foot of the mountain, ahout seven miles. From the power house to Fresno is about thirty-two miles. The engineers in charge calculate that 900 H. P. can be delivered at Fresno at ahout one-half the present cost of power there.

In English dynamos, according to *Engineering*, it is usual to wind the coils outside of the soft iron core, but in America the practice of inserting the copper in slots in the core is preferred. The latter method has the advantage of allowing the core to run almost in contact with the field magnets. The consequent reduction of the "air space" allows the maker to use smaller magnets. A machine of a given power, therefore, can be built by this method more quickly and more cheaply, and it is stronger than one of the other kind. But English electricians say that the slotted armature dynamos show a tendency to spark at the commutators.

The broad, shallow entrance to New York bay has ouly one channel of sufficient depth to admit deep-draught steamships, and this has long been marked with spar-buoys on each side. They were visihle, however, only by day. To make the channel navigable for large vessels at night, therefore, incandescent electric lights, each of 100 candle power, have been mounted on some new spar-huoys. A cahle six and a half miles long supplies them with current from a dynamo on shore.

Two or three projects for converting water power into electricity, and transmitting the latter to Atlanta over a line seven and a half miles long, are now under consideration in that city. One of them would develop 14,000 horse power, another 20,000 and a third 36,000. These are all modifications of the same general plan.

Practical Information.

A Bicycle Factory.

Only those who have visited a bicycle factory and have observed the great amount of work, as well as the army of men, hoys and girls required in the making of a single wheel, can account for a hicycle costing as much as $100, four times the amount for which a horse may he purchased. Two years ago the price of a wheel was $150, but competition has brought the price down, at the same time that it has made the expense of putting the wheel on the market much more than before.

Chicago is the center of the bicycle industry, where there are forty places where hicycles are made. Twenty of these places are factories devoted exclusively to the manufacture of wheels. So great is the demand now for bicycles that these numerous factories cannot turn them out fast enough to supply those that want them. This is because so many more women are now riding bicycles. One-twentieth of the wheels sold last year were to women, while this year it is one-third.

Special machinery and skilled labor are employed in making the bicycle. Except in the cheapest grade wheels, the best material is used, as this costs very little more than the poorer kind, lahor heing the greatest expense.

A bicycle cannot be made in a day, nor yet with the eyes closed. It is a complication of various things that enter into the makeup of this modern horse.

As far as can be ascertained by a layman, there are twenty-six different parts to a wheel, and all these details are worked out hy different people, each separate piece requiring different handling and passing through numerous hands before it is finished.

In looking at a bicycle, we see that there are four different parts to it—the wheels, the frame, the running gear and the steering apparatus; but iu analyzing it we find that a multiplicity of things enter into its construction. The wheel is made up of spokes, hubs, rims, tires, spoke nipples, ball valves, cups and cones, and the washers that go with them. The frame consists of the diamond-shape set of tubes that join the wheels together, the head through which runs the steering tube, the rear fork, the seat post and crank hanger. The steering apparatus includes the handles, the steering tube, the fork sides around the front wheel, the fork crown and the balls, cup and cones on which the steering tubes turn. The running gear is composed of the pedals and crank which operate on the sprocket wheels, the chain which connects them and carries the driving power and the hall hearings on which these things revolve. The saddle may be included with the frame.

In making the frames, hollow steel tubing is now employed, instead of the solid steel bars formerly used. This lessens the weight and at the same time is stronger for being hollow. An improved method of making the joints also lightens the weight of the wheel and adds to the strength. The joints are now brazed, one piece into the other, instead of being made with the old heavy castings and reinforcements. In the fork crown, too, of the machine, drop forgings are used instead of the heavy castings.

For the rim of the wheels a sheet of steel four feet broad and twenty feet long is put into a cutter that rips it the required widths, and then cuts it into the lengths needed. From this cutter it goes to a machine that bends it into a circular form, then through another that turns up the edges in a concave shape to hold the ruhber tire. After this the two ends are hrazed together, holes are drilled for the spokes, and the rim is finished, except for the nickeling and polishing. The spoke, spoke nipples, hub and washers are all handled separately.

The running gear of a wheel requires particular treatment, as not a single detail of this gear is put into a wheel

without every assurance that it will do its part of the work perfectly. Each piece is made with the utmost precision, after being handled a dozen times, and is tested for every possible strain. Special machinery is required for most of it, and only expert workmen are employed.

Automatic machinery is mostly used in the manufacture of the smaller parts of the wheel and these machines are operated by girls and boys. The oil cups, nuts and rivets used in a wheel are made by automatic machines that bite off pieces of steel, turn them about a few times on automatic lathes, and then throw them out finished and complete. Sprocket wheels are first cut in circular form from a plate of steel by a heavy drop-hammer, then strung together in lots of a dozen or more in a machine whose teeth eat out spaces in the rims, and make the notches, one row at a time, on which the propelling chain turns. For the saddles, certain sizes of leather are soaked and then put through a number of shaping presses until they are of the proper shape. Most of the work is done by girls. A number of boys are employed in putting the spokes in hub and wheel, and a puzzling job it is, too, which one inexperienced could not do. Another trick is putting tires in the rims. The enameling, nickeling and polishing of the different parts are done in the usual way.

When all the different parts of the bicycle are made, they are sent to a large room, there they are again thoroughly tested and then put together. This is called the assembly room.

The Wheel.

A wheel is a contrivance to utilize some of the principles of motion of a ball or sphere.

A ball or sphere moves upon a level surface easier than any other form of solid matter. This is because its center of gravity is not changed in its progress. If a ball moves upon a level surface its center of gravity describes a line parallel to its surface. If a ball is balanced in every direction when it is at rest, the power required to set it in motion is just enough to unbalance it. Like a pair of scales balanced with a ton weight on each end of the beam, a few ounces added to either end will move them.

A carriage wheel in principle is a slice from the center of a ball. So long as such a wheel moves uprightly upon its rim, it has the facility of a ball to move in two directions only. To keep it in this position an axle is put through its center. This adds friction to it and also shortens the leverage by which it is propelled, from its rim to its center.

A carriage wheel has to do duty generally upon a common road. A wheel sinks some in the loose material upon the surface which it has to surmount in its progress. This is called traction or rolling friction.

The rubbing of two substances together causes friction. It is the resistance to the motion of one substance bearing upon another. It increases with the weight or presence of objects at their frictional contact, but not with the extension of the frictional surfaces.

If four blocks of wood or other material of one kind and of a similar weight be placed one upon the top of the other and dragged upon a board or other smooth surface, and the weight or force noted that is required to pull them, then if the same four blocks are spread side by side and dragged upon the same surface, it will be found that the same weight or force will pull them, showing that if the surface in frictional contact be extended, but the pressure upon them not increased, the resistance called friction is not increased. This law applies to axles.

Friction does not increase with the size of an axle, but a wheel loses power or leverage with such increase, also by increased weight.

The actual friction going on within an axle box is more than eight per cent, because we have not taken into consideration the rubbing of the washers on the axle end and collar and the gather of the axle; but as these are so little in good running wagons, they may be neglected.

Traction, or the resistance to the progress of a wheel upon a macadamized road has been practically proved to be about one-thirtieth of the load. The power required to move 500 pounds would be seventeen pounds upon a good hard road; therefore a horse will be required to pull at the rate of 40 + 17 = 57 pounds to draw 500 pounds on free running wheels.

If an obstacle, say four inches high, be in the way of a "four-foot" wheel, the center of gravity will have to be raised four inches to overcome it. The lever to do this with is just half the height of the wheel, viz., two feet. This lever is of the third order of levers—that of having the power come between the load—which is lifted, not pried, and the fulcrum. Neglecting any momentum the wagon may have, and calling it a dead lift, by the law of virtual velocities, "the power multiplied by the distance it moves vertically or in a right line equals the load or weight multiplied by the distance it moves virtically or in a right line."

Now, by adding the friction of the axles and traction—found to be 57 pounds—to 158, we have 215 pounds, which is the force a horse will require to exert to haul 500 pounds up such a slope of a macadamized road. This 500 pounds means all that bears upon the axle boxes; that is, the total weight of wagon and load minus the weight of the wheels.

That the part of a carriage wheel above the axle moves faster or through more space than the part below it is because this kind of a wheel is a lever of the third order. Such a lever has the power applied between the weight, which is to be pushed, pulled or lifted, and the fulcrum, the same as in raising a ladder. Imagine two spokes in a line to be a ladder, the lower end on the ground, the force on hand being used at the hub, the front on the ground, which is the fulcrum, remains stationary, while the upper end moves through a space which will be double the distance that the middle or hub goes. The rim being endless, each point as it touches the ground becomes a new fulcrum. A carriage wheel is thus called a perpetual lever of the third order.

NINETY-NINE of every hundred human beings, says Dr. Cyrus Edson, are unconscious for several hours before death comes to them. All the majesty of intellect, the tender beauty of thoughts or sympathy, or charity, the very love of those for whom love has filled all waking thoughts, disappear. As a little baby just born into the world is but a little animal, so the sage, the philosopher, the hero, the statesman, becomes but a dying animal at the last. A merciful unconsciousness sets in, as the mysterious force we call life slowly takes leave of its last citadel, the heart, and what is has become what was. This is death.

FARMERS in Mexico use oxen of one color in the morning and of another color in the afternoon. They have no reason for doing so beyond the fact that their forefathers did it, and they conclude it must be the right thing to do.

WANTED!

A Gold Quartz Mine

For a first-class client. No property but that which will stand close investigation will answer. A dividend-payer very much desired. Parties having good gold properties for sale at true value are requested to correspond with

J. F. CROSETT,

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The Term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.
CORRESPONDENCE SOLICITED.

Mining Summary.

CALIFORNIA.

Amador.

MINING ITEMS.—*Republican*: The Amador Queen No. 1, in Hunt's gulch, is in operation under the management of James E. Dye, agent of the Jackson Gold Fields, an English corporation. There is a 40-stamp mill near the property belonging to the same company. The mine has been prospected to a limited extent. A tunnel has been run 250 feet. At the distance of 150 feet the tunnel connects with a shaft sunk from the surface, and tapping the tunnel at a depth of fifty feet. The intention is to get at the bottom and take out ore for a test run. Assays of samples taken from different points indicate an average of between $3 and $4 per ton. There is a vast body of it, the outcroppings indicating a ledge from 60 to 100 feet wide. It is intimated that the rock can be mined and milled at a cost not to exceed $2 per ton, so that rock milling $3 can be made to pay a fair profit. The company will operate with inexpensive machinery until sufficient development work has been done to prove the character of the property.

ACME.—A. B. McLaughlin has sold this mine to a Colorado company. It is situated three miles east of Volcano. J. D. Gould will be superintendent and Mr. Hearst foreman. Work was commenced last Monday.

At the Argonaut the shaft is down 800 feet. At the Anita they are still drifting east in the hardest kind of rock. It is rumored that unless a change occurs soon drifting operations in this direction at least will be suspended.

At the Alma they are still running west hunting for the ledge. The payment on the Boxall bond is about due, but it is likely that an extension of time will be granted.

THE GOVER.—*Ledger:* The old Gover, which has been idle for months, will start in a day or so. A sixty-stamp mill will he erected at the least. This property is controlled by Utah Church capital and will no doubt be probed to the bottom.

NORTH GOVER.—The north Gover has been bonded for $20,000 and work will be commenced immediately. The Black Hill, close by, has also been bonded.

DOWN MINE.—Al. Harris and J. Gubbins of Kennedy mine are removing to the South Eureka mine, near Sutter Creek, the twenty-stamp mill once owned and operated by the Down mine people.

MECHANICS.—T. D. Valentine has resumed operations at Mechanics mine. One hundred tons of ore will be crushed in the Wildman mill and it is then the intention to put in a pumping plant and clear the shaft of water.

GWIN MINE AND MONTANA MINE.—The shaft in the Gwin mine is down 820 feet; at 900 to 1000 feet they expect to find some stringers of quartz. The crosscut is in 175 feet.

At the Montana mine they have struck the hanging wall and will follow this for some distance. They are now down nearly 65 feet and will put in a pump and engine to hoist with, also build houses, erect a mill of twenty stamps and make other improvements.

Butte.

SHIPPING SULPHURETS.—*Mercury:* The Banner mine is engaged this week in shipping many tons of sulphuret concentrates to the Selby refining works at San Francisco. The product of the concentrators is allowed to accumulate at the mine until many tons are on hand. Then it is sacked and hauled by team to Oroville and shipped in carload lots.

Mariposa.

A TEN-STAMP MILL.—A ten-stamp mill was shipped last week to the mining property of Cox & Roberts of Madera. The property is situated in Mariposa Co.

Nevada.

A BIG CLEAN-UP.—*Transcript:* The last clean-up at the Harmony drift gravel mine was highly satisfactory, being about the largest made there in a long time. Splendid gravel is being taken out right along and the prospects are that the present good returns will continue and that the company's indebtedness will soon be liquidated and the stockholders begin to receive dividends.

GRAVEL CLAIM PURCHASED.—*Transcript:* A company recently organized at Graniteville has purchased the gravel mine at Chapparal Hill, near Graniteville. The mine has been the property of J. T. Cline, and in years past some fine gravel has been extracted from it and the idea is that there is plenty left. The new company will develop the property systematically, and good returns are expected.

MINING DEAL IN PROSPECT.—The mining sale talked of for several weeks is likely to come to a head within thirty days, and then we shall see what old Comstockers can do in the way of opening up the two properties referred to—the Nevada City and the Chapman mines. It is said that when they get hold of these properties more men will be employed than at any two mines in the district, and their new hoisting and pumping plants and mills will equal, if not excel, anything in the district.

Siskiyou.

GENERAL NOTES.—*Journal:* The third cut at the Benz Bar mine, near Honolulu, Klamath river, has been commenced, with prospects of still better yield than from the two former cuts to bedrock. This is considered the best claim on the river, but the Chinese working it never tell how much they take out.

The Lee Hung Co. on Klamath river, just above the mouth of Humbug creek, has one of the richest river claims in the country, but no one can find out what amount is realized. A mining expert offered the company $10,000 for it, but the price asked was $40,000, and no one believes it could be bought for that sum. There is at least eight to ten feet of bedrock gravel, over forty feet wide, that shows gold to the naked eye.

The David ledge near mouth of Shasta river, on the Klamath, still continues to prospect well. It is a blanket ledge, the rich pockets being found where it strikes an upright ledge. The ledge extends along the surface about a quarter of a mile back of the river, and runs in waves, up and down, with sulphurets of iron underneath, next to the base rock. This ledge is supposed to be a continuation of the Burleson ledge at Ash Creek on opposite side of the Klamath.

Sooger & Dame, working the old McConnell & Quinne and Pacific mines on the island in Klamath river, at mouth of Humhug, are working high bedrock, day and night, with a large force employed. They expect to take out considerable money from the gravel near the surface, supposed to be the debris accumulated from the wash of Humbug creek. This firm has expended about $7,000 in putting in machinery to work the claim, and it is now well rigged for successful operation.

Sonoma.

A HEALDSBURG INDUSTRY.—A five-stamp mill was received by the Healdsburg Paint Company last Thursday which will be put in operation and will enable the proprietors to turn out thirty tons of paint a day.

Tuolumne.

WAGON ROAD FINISHED.—*Democrat:* F. Hill, Superintendent of the Wheeler-Hill mine on Moccasin Creek has about completed a wagon road to Moccasin Creek and to the mine.

THE CRYSTALLINE MINE.—C. E. Shaffer, manager of the Crystalline mine, below Jamestown between the Alabama and Trio mines, has fifteen stamps in operation.

NEVADA.

STOREY COUNTY.

THE PROPOSED DRAINAGE PLAN.—*Enterprise:* Colonel Boyle, the superintendent of the Alta, being asked concerning the proposed plans to drain the American Flat country, said: "Perhaps it is as yet a trifle too soon to talk about the American Flat country, but it is already practically decided that drain tunnels are going to be run, not only to American Flat, but to Silver City. The Alta shaft has connection with the Sutro tunnel and a drainage tunnel will be run from this point 6000 feet to the Silver City country and another 6000 feet to the American Flat. The Comstock Tunnel Company has practically made a proposition through its president, Mr. Franklin Leonard, to run the tunnel to Silver City, if the Gold Hill and other mining companies interested would run a similar drainage tunnel to the American Flat country. This plan has been virtually accepted by all parties concerned, and we may expect to see actual work begun within the next month or so. In all, 18 mining companies are interested in the proposed American Flat drainage tunnel. These companies represent from 100,000 to 108,000 shares each. The total cost of running the tunnel will he $200,000, or somewhere from 10 to 12 cents per share."

THE NEW DEPARTURE.—Work has been commenced at two points on the Brunswick lode. On the section of the lode which is to be prospected by the Hale & Norcross Company preparations are being made for sinking an incline. The incline will start in quartz that prospects well in gold. It is expected that a good deposit of paying ore will be found at no great depth below the surface. The Gould & Curry Company will prospect their section of the vein by drifting from the 400 level of shaft No. 3 on the Sutro tunnel. They are of the opinion that by drifting from the shaft they will reach pay sooner than they would were they to run an incline.

The only new development on the Comstock of late worthy of note is a streak of ore assaying $100 a ton recently found in the Potosi. This will give a valuable addition to the ore-producing sections of the mine.

Franklin Leonard, president of the Sutro Tunnel Co., says to the *Enterprise*:

"There is no reasonable doubt in my mind that pay ore in paying quantities will be found on the Brunswick lode, and the Comstock tunnel is well nigh indispensable to the economical development of this great ledge. You remember I spoke to you some time ago about shaft No. 2. It is now in need of repairs, which will be commenced immediately on my return from New York. By means of this shaft and the tunnel the ore of the Brunswick can be transported to Sutro at a very small expense. It is the purpose of the Tunnel Company to build mills at Sutro, as I have before told you. Water power is to be taken to the Brunswick lode to operate the hoisting machinery there. An 8-inch pipe is to be laid from the Virginia and Gold Hill Water Company's head. This is now a settled fact. After operating the machinery on the lode the waste water can readily be caught in a reservoir 1300 feet above Sutro, by means of pipes down shaft No. 2, and through the Comstock tunnel this waste water can be taken to Sutro, and it will have ample power to run a large-sized mill, with the aid of the water now coming out of the tunnel and available from other sources.

"With such a mill built at Sutro, and with economical facilities of getting the Brunswick ore to it, a vast amount of money might be saved in the reduction of this ore, and if large bodies of low grade ore are uncovered they can be worked on a paying basis, whereas, under the present arrangements, they could not. I am not a mining man and shall dictate no policy to anyhody concerning these matters, but it will be my earnest effort to bring these things about with the co-operation of the people."

ON THE COMSTOCK.—In the Crown Point mine the south drift from the tenth floor of the raise on the 700-foot level has not been advanced since last report, the time having been occupied in cutting out for square sets preparatory to the extraction of ore at that point. There is no particular change to note of the stopes above the 700-level. They continue to open out to the south on the fifth floor, and as high as the ninth floor, where the quartz is from 8 to 15 feet wide, running from $8 to $11 per ton, principally gold, and with a sharp strike to the southeast. Have extracted during the past week 612 tons and 710 pounds of ore, which was shipped to the Mexican mill for reduction. The average battery sample was $10.08 per ton, of which $8.95 was gold. Have shipped one bar of bullion, the June clean up, the par value of which was $22,182.61 and from which coin returns of $21,529.98 have been received, and the proceeds of 2720 tons of ore worked in June.

In the Belcher mine, on the 300-foot level, the joint Belcher and Seg. Belcher south drift is in 305 feet from the main shaft. The face shows quartz giving low assays. On the 1100 level the northeast crosscut is out from the north lateral drift 127 feet. The face is in quartz and porphyry. Hoisted during the week 43 tons of ore, the average assay of which was $22.17 per ton.

The yield of the Seg. Belcher mine for the week ending July 15th was 20 tons of ore, the car sample value of which was $26.53 per ton.

In the Challenge Con. and Confidence mines the west crosscut from the top of the joint upraise from the surface tunnel is out 110 feet. The face is in quartz of no value.

HUMBOLDT COUNTY.

The gold-hearing veins about Willow creek thus far discovered are of low grade, but often of immense size. Some are like quarries, and the ore at the very surface yields at the rate of $5 a ton. In the district are small veins and streaks of quartz that are much richer. Little attention has been given any of these. All prospectors go after the biggest veins in sight, and then they have something that they are unable to handle.

Recently a rich gold discovery has been made to the northward of the old town of Star City, at one time the big camp of the Humholdt country. The new find shows quartz so rich in gold that it can hardly be broken apart. The men who made this big find pack their ore down out of the mountains on the backs of mules, when it is loaded upon wagons and taken to the railroad.

The Star City people cared for no mines except such as carried silver; they did not hother with gold. The place is now utterly deserted. Only the ruins of some of the larger buildings and those of a few stone cabins remain to show where the town stood. At several points about the old town, and up and down Star canyon, are to he seen apple trees that are over thirty years old. This season all these trees are loaded with fruit. Old Star Peak, 10,000 feet high, looks down upon the camp as in the old days, hut of all those who once thronged the town not a man remains to look up at the peak.

The geology of that section, and of the whole Star range, shows that it is better for gold than for silver. Now that attention has been attracted to the region hy a big gold find, the old town may be peopled anew and new buildings may be erected among the ancient apple trees. Some are of the opinion that this Humboldt gold belt extends northward into Idaho. Parties from Idaho, scouting down into northern Nevada recently, report having found rich veins of gold-bearing quartz, and also some fine veins of copper. The copper veins also assay well in gold.

ESMERALDA COUNTY.

THE SALE OFF.—J. A. Yerington informed a Reno *Gazette* reporter that the sale of the group of mines in Silver Star district, which he had about concluded with Senator Wolcott of Colorado, is off. Senator Wolcott wanted to pay $100,000 and the balance when he worked it out of the mines.

While Mr. Yerington is a little disgusted over the outcome of a trade that he had every reason to believe was hased on sound business principles, with business men, and has done much work to bring capital into the district, he is by no means discouraged and the Wolcott fluke will rebound in advantage to the men who own the property. Very valuable discoveries are being made daily and instead of the group which comprised the supposed sale being worth $500,000, the syndicate who buys it will have to pay $1,000,000 for it now.

OREGON.

ON THE KLAMATH.—Several companies are opening up river claims in the Klamath above the mouth of the Shasta river, as well as below, all expecting to take out considerable gold this season.

SALE OF THE ASHLAND MINE.—The sale of the Ashland mine under the judgments of A. E. Kinney *et al*, aggregating $21,523.43, was made at Jacksonville last Saturday. The creditors, represented, made the purchase. It is understood that work will be resumed on the mine.

THE HAMMERSLEY PROPERTY SOLD.—Gold Hill *Miner:* Three months ago Morton Lindley bargained for the Hammersley Mining Co.'s property, situated on Jump-off-Joe, and located about twenty-five miles north of Gold Hill. The group of mines comprises Daisy, Little Dorrit, Lady Oregon, Coxey and Hopkins' Choice, and the property has been worked with successful results ever since the discovery of the property, some two years since. Mr. Lindley bargained for the property with the condition of placing on the property hoisting works and necessary machinery for working the mine for six months in order to test its merit. After a two months' run Mr. Lindley became satisfied that the property was all right, and, as a result, he and his associates have purchased the property outright.

WASHINGTON.

NEAR DAVENPORT.—A Davenport dispatch says: The Cleveland has fifty teams engaged in hauling the ore on the dump to Springdale. The company expected that the dump would have to be run through a concentrator before it would pay to ship it, but it has been ascertained that it is in great demand for fluxing purposes hy the smelters, and arrangements have been made whereby the smelting is done free of charge; hence the dump is being shipped bodily.

Del Hart, of Golden, Okanogan county, has gone to San Francisco to buy machinery for the Tribune mine of that place. Davenport parties are interested with him, and bope when improved machinery is put in place to handle the ore so that the profits of the mine will make them rich.

BRITISH COLUMBIA.

MINING ON TRANQUILLE CREEK.—Kamlloops *Sentinel*: P. Daly three weeks ago discovered good placer prospects on a bench of this creek, about thirty feet above the bed of the creek, the prospect in some cases going as higb as one dollar to the pan in fairly coarse gold. There have been located and recorded a number of hydraulic and placer claims. C. L. McCammon, of Vancouver, who located a hydraulic claim a short time ago, showed his proposition to a mining capitalist from Chicago who promised to lay the proposition before those who were interested with him on his return. They write that the deal bad been completed and that work on the claim would he started at once. There is said to be now no less than six hydraulic and over a dozen placer claims taken up in addition to those already located.

IDAHO.

AT THE CARIBOU.—The order of the Probate Court at Blackfoot, giving the Union Mining Company possession of the Caribou group, near Soda Springs, has been annulled by an order from the Judge of the District Court and the Idaho Mining Company is now in possession. Each side claims to have acquired its rights under a hond obtained from the owners. The Union Company claim to have paid over the amount of the bond to the owners. The Idaho Company contend that the Union Company defaulted, and that thereupon a bond was secured by their company. The Idaho Company is in possession, after its recent ejectment and the closing down of the mill, and the mill at the mines is again at work. The Idaho Company is handling about twenty-four tons daily. The ore is low grade, running between $5 and $6 per ton, but is found in great ahundance, and promises very handsome earnings for the company that holds the winning hand.

UTAH.

BOUGHT THE STEWART MINE.—J. K. Clark of the Moulton, Montana, has purchased the Stewart mine in Bingham. The Stewart is a low grade gold proposition and it is understood that Mr. Clark will treat the ore with the Murphy gold saving machine formerly in use at the Moulton.

MONTANA.

AROUND COLOMA.—Six thousand dollars was sent to Coloma last Friday to pay off the men working on the Mammoth mine. Coloma is now one of the most prosperous little mining camps in western Montana. Two 10-stamp quartz mills are working in the vicinity. The stamps are dropping with cheerful regularity on good ore, and the cleanups are said to he very satisfactory. There are hetween 250 and 300 men in the camp and surrounding hills. Many of these are prospectors working on their own claims, and the indications are favorable for another mill or two being erected within the next 12 months, says the *Missoulian*.

A GREAT YEAR.—*Inter-Mountain:* 1895 is going to be a great year in Butte. It takes a good many miners to produce 210,000,000 pounds of copper, but that is going to he the output. It means prosperity for 40,000 people. It means that more than $25,000,000 in copper, silver and gold will come from the mines of Butte before next January, and that most of it will remain here for labor and supplies.

SALE OF SUNRISE STOCK.—At Phillipsburg yesterday F. M. Durfee and F. W. Sherman have bought 127,000 shares in the Sunrise for $40,000.

WYOMING.

SPUR TO THE IRON MINE.—A party of Union Pacific surveyors is surveying a spur to the Iron mine, two miles north of Rawlins. The Iron Company is now shipping one hundred cars of ore per month to the Denver smelters, which will be doubled when the spur is completed. The ore is said to run $9 per ton in gold.

PLACER MINING CANAL.—E. A. Green of Providence, R. I., bas taken the contract for the construction of the West Side Placer Mining Company's canal, which will be thirty-eight miles long, and which will carry water to work the placer grounds of the company. Work on the canal will be pushed as rapidly as possible. In addition to the ditch work there will be 1,000 feet of flume and two miles of wooden pipe.

COLORADO.

BLACK SWAN MINING CO.—The Black Swan mine, on Silver Creek in the Burrows Park mining district, has been sold to a company of Toledo, Ohio, capitalists, who have organized as the Black Swan Mining Company, and will develop the property. Specimen assays of ore taken from the Swan have given returns of 370 ounces in silver and seven ounces in gold.

At Idaho Springs, Colo., in the west end of the lower level of the Amy C. mine, a solid streak of smelting ore eight inches wide has shown in the heart and it has carried this width of some distance. The ore runs from two to three ounces in gold, twenty-six ounces silver and some lead. This level is worked by leasers and last month four of them cleared $9 a day each after paying all expenses and high royalties. It is with a view of reaching this large body of high grade ore that the lower levels are being extended.

CHANCE FOR LOW GRADES.—Colorado Springs *Gazette:* Two years ago ore that would return less than $20 per ton was not considered worth shipping to smelters. It had to run through the stamp mills, where but forty to fifty per cent of the gold and silver was saved, and then sent to the smelters. Now the smelters bave reduced their schedule of rates to range from $3 to $7.50 per ton, making this the era of low grade ores.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O.,
Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

CLEVELAND IRON ORE PAINT CO.

THE AM. BALL PULVERIZER. Morris Patent.

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

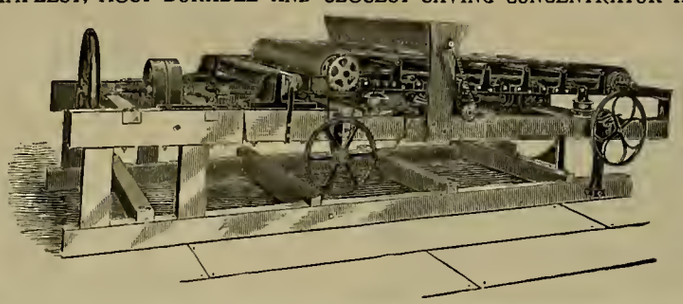
The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works.

Market Reports.

The Markets.

SAN FRANCISCO, July 18, 1895.

The upward tendency in the metal market continues. Copper is particularly buoyant. The production of copper in tbis country in 1894 was 360,844,218 lbs., against 337,416,848 lbs., in 1893; increase, 23,427,370 lbs., or seven per cent; in addition, 6,635,844 lbs. were produced from imported pyrites.

Under date of July 1st, Jas. Lewis & Son report from Liverpool, England, as follows:

Copper. — Good merchantable copper has fluctuated within a range of £1 11s 3d per ton during the past month, falling from £43 15s to £42 3s 9d on the 11th ult., recovering to £43 on the 14th, only to fall again to £42 6s 3d on the 18th, due to an increase of 1560 tons in the English and Frencb stocks, advancing again to £42 12s 6d on the 24th, falling to £42 5s ou the 27tb, and closing to-day at £42 7s 6d, notwithstanding a further increase of 2161 tons in the stocks. This increase is mainly due to the large arrivals of Boleo copper—tbe production of six months—amounting to about 5139 tons fine. Prices in New York remain firm at 10.62½ to 10.75 cents per lb. for Lake and 10.50 for electrolytic, which are much above values here. Little or no American copper can consequently be obtained for shipment to Europe. Sixty tons Lake copper sold for a special requirement at £50 15s per ton, less 2½%, delivered. Tbree thousand three hundred and seventy tons of matte and 1470 tons of bars have arrived at Swansea from Boleo, also 2100 tons matte and 500 tons bars at Dunkirk. We understand that one-third of this company's production for this year bas been sold to Swansea smelters on a G.M.C. basis, and that the balance goes to French smelters. The deficient supply of small arms ammunition which brougbt about the fall of tbe late Government on tbe 21st ult., was estimated at 150 millions of cartridges, representing a consumption of about 2000 tons of brass. It is to be presumed that the new Government will take early steps to supply tbis deficiency. Imports are 343 tons, and deliveries 452 tons greater to date than duriug the same period of last year. The total arrivals in England and France for the montb have been 13,104 tons, and the deliveries 9383 tons fine. Stocks bave increased 3721 tons. The arrivals in England from Chile during the month have heen 1625, and the deliveries 693 tous fine, and from other countries 8365 aud 4969 tons fine respectively. The arrivals in England from tbe United States have been 878 tons bars, 41 tons ingots, and 1534 tons matte, equal to about 1733 tons fine copper, and in France 345 tons fine. The Cbile cbarters for the montb are advised as 2100 tons, and exchange 17¼d. Sales of furnace material have been confined to: June 11th, 110 tons ore, Portuguese, about 5% to arrive, Liverpool on private terms.

Quotations to-day are: Cbile bars and good merchantable copper £42 7s 6d for casb, and £42 13s 9d for three months' prompt, buyers. Englisb best selected ingots £46 to £46 10s, and Tough Cake £45 to £45 10s per ton. 8s 3d for ore of 20 per cent, and 8s 6d per unit for Chile Regulus or American matte, free from silver.

Gold.—77s 9d per ounce standard.

Silver has fluctuated between 30 9-16d and 30 3-16d per ounce standard, closing firm at 30½d.

Quicksilver from second bands is quoted at £7 8s to £7 8s 6d per bottle.

Sulphate of copper sells at £15 5s to £15 10s for prompt and forward delivery.

Lead.—£10 7s 6d to £10 10s per ton for English; soft Spanish, £10 6s 3d; rich in silver, £10 7s 6d to £11 2s 6d per ton; ore of 70 per cent, £4 4s 1d per ton and fine silver value. The import of silver lead from Mexico amounts to about 100 tons.

Antimony.—£31 10s to £32 per ton.

Mining Share Market.

SAN FRANCISCO, July 18, 1895.

There was a little rise in the early part of the week, and a corresponding drop iu the latter. In the Comstocks this is accounted for hy the geueral tendency of the street to scariness. In the case of Bodie the drop was occasioned by one of the reports filed hy Messrs. Ryan and Gildea, who recently visited the Bodie Con. ou behalf of the dissatisfied stockholders. The former thinks that tbe Bodie Con. bas a good claim against the Standard for damages considerably in excess of tbe sum set in tbe suit; but the latter makes a very unfavorable report as to the present showing of ore in the mine.

The following illustrates the changes of the week:

A DIAMOND PROSPECTING CORE DRILL

FOR UNDERGROUND WORK.

Complete, in working order. To be run by compressed air and drill from 300 to 1000 feet. Give terms or spot cash price, and all particulars at once. "The Sullivan" preferred.

BOX NO. 23, CRESCENT MILLS, PLUMAS COUNTY, CALIFORNIA.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOULD AND CURRY SILVER MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the second (2d) day of July, 1895, an assessment (No. 76) of Fifteen (15c) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixth (6th) day of August, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the Twenty-eighth (28th) day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 5th day of July, 1895, an assessment (No. 27) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 12, rotunda, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 4th day of September, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. W. SARGEANT, Secretary.

Office—Room 12, rotunda, Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of May, 1895, the several amounts set opposite the names of the respective shareholders as follows:

542,495.—CAR COUPLING—Potts & Daniel, Prescoll, A. T.
542,376.—DISINFECTING APPARATUS—Scott & Bradshaw, S. F.
542,429.—PROCESS—E. A. Starke, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELEVATOR CUT-OUT VALVE ATTACHMENT.—Andrew J. McNicoll, S. F. No. 542,421. Dated July 9, 1895. This invention relates to an attachment for elevators. It consists of a cut-out valve attachment or plunger, which moves in the same direction with the hydraulic cylinder piston and cross-head, so that the cut-off is produced by a direct closure in either direction, without any reverse mechanism. The cylindrical valve chamber has closed ends and stuffing boxes for the passage of a valve rod, the valve which if fixed to said rod being movable loosely in its chamber parallel with the main hydraulic cylinder, said valve being open at both ends for the free passage of water through the valve, whereby it is balanced, and it has an intermediate port normally corresponding in position with the transverse passage made through the valve chamber, and connecting the main cylinder with the source of supply. In conjunction with this is an extension of the valve rod, having fixed collars and an arm fixed to the piston rod; a cross head adapted to strike the collars and move the valve in the same direction with the piston without intermediate levers. Means connected with the valve rod return the valve to its normal condition when the main supply valve is open.

CAN LABELLING MACHINE.—Henry Albert, Crescent City, Cal. No. 542,433. Dated July 9th, 1895. This invention relates to a can labelling machine. It consists of a paste-container situated at one end of the machine, having a horizontal, movable platen adapted to travel above it, and rollers whereby the paste is delivered from the container upon the under surface of the platen, a can-puller adapted to receive cans from the supply chute and to roll them in a horizontal runway above a chamber containing labels which are to be applied to the cans, a paste roller, vertical reciprocating paste heads, movable above the ends of the labels, so as to apply paste alternately to these ends, a paste roller movable by the can-puller and adapted to roll beneath the paste-heads when the can-puller is reciprocated, a mechanism whereby the can-puller and the platen of the paste receptacle are caused to reciprocate in opposite directions, so that the paste is delivered from the platen upon the paste roller of the can-puller when the two approach each other, and is delivered from the paste roller upon the paste heads when the can-puller returns. The machine embodies various details and improvements, by which its efficiency and accuracy is greatly increased.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Kendall et al., in the Sharp Mine, near Brandy City, Sierra Co., to impound tailings in Sharp Ravine, an old pit, and on the bank of the north fork of the Yuba River; from W. R. Atkinson et al., in the Homestake Mine, near Gold Lake, Sierra Co., to impound tailings in a ravine; from Toland & Landon, in the Corkscrew Placer Mine, near Spanish Ranch, Plumas Co., to impound tailings in ravine below the mine and on bank of Spanish Creek; from Henry Goerling, in the Last Chance Mine, near Gold Lake, Sierra Co., to impound tailings in a dry ravine; from James Chapelain, in the Chapelain Quartz Mine, near Rackerby, Yuba Co., to deposit tailings in Honcut Creek; from Luigi Lagomarcini, in the Romie Mine, near Loganville, Sierra Co., to impound tailings in an old pit; from T. T. Kirkham, in the Big Ravine Mine, near Blue Tent, Nevada Co., to impound tailings in ravine below the mine; from the Interior Development Co., in the Brown Placer Mine, near Michigan Bluff, Sacramento Co., to impound tailings on flat ground near Arkansas Creek; and from the Cascade Water and Mining Co., in the Cascade Mine, Beckwourth Tp., Plumas Co., to impound tailings in Grizzly Creek, gives notice that a meeting will be held at Room 62, Flood building, San Francisco, Cal., July 29th, 1895, at 1:30 P. M.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Recent Installation at Ontario, Cal.

The accompanying illustration shows one of two Girard water wheels which have just been installed at Ontario, Cal. Both wheels are for driving electric dynamos, one of the dynamos being for lighting and the other for operating the Ontario Electric Railway. The plate shows very plainly the details of the wheels, with the governor and hydraulic cylinder to operate the gate. The supply for the cylinder is taken from the pipe line, so as to be always ready for operation even though the wheel is not running. The governor operates a balance valve through the connections shown. Adjustments are provided in several places to control the various elements of the movement. The wheels take their supply from a common receiver through the pipe shown. The bearings are made self-oiling and self-adjusting to insure smooth running and perfect lubrication. The shafts are of steel and all parts are heavy and well finished.

The sole plates on the concrete foundations are not shown in the cut, but there is one for each stand and one under the gate.

The office and works of the Girard Water Wheel Co. are at 34 and 36 Main street, San Fraucisco.

GIRARD WATER WHEEL AT ONTARIO, CAL.

A Development Company.

"Buying and Selling Mines" is the caption given some recent interesting correspondence in this paper on that subject. There is no matter of more present importance than this. Upon its correct handling depends largely what turn the industry will take in this new era which has already begun. It has been cleverly said that there are two classes of men in the world—those who do things and those who afterward sit back and tell how those things should have been done. This is particularly noticeable in the mining world, where precedent and tradition go a long way. This is not a question of hide-bound beliefs. It is for those who are willing to back reasonable opinion by the argument of action to go ahead and succeed. The idea all along has too largely been to let the prospector work out his own salvation; to have little to do with anything but "a going concern," that is, a mine that has paid or is paying expenses in active operation, with a promise of continuance. That on the one hand. On the other, a desire to have a hole in the ground looked upon as a valuable property, and an assay from an outcropping accepted as evidence of value justifying the figure asked. There is now under discussion a proposition that appears to be worthy of commendation; it is not the sole idea to either "buy" or "sell" mines. It is more an outgrowth or manifestation of the new spirit of the times to develop the resources of the commonwealth. It being plainly evident that mining for gold has assumed uuusual prominence and that California is the best section of the universe in which to mine for gold, the idea is to practically combine in this State modern metallurgy and mining methods with modern business methods; to have mine development and cooperation with mutual profit. Under existing conditions in a majority of cases the individual owner of a mine is not in financial fix to show its value, and the "promoter" is an expensive factor. It is proposed to eliminate this gentleman and deal more directly. An organization provided with capital, able to expert a proffered property, furnish the requisite machinery for development and demonstrate the value of the mine, assuming the entire cost, standing the loss if any, and sharing in the probable profit, would be of service to the State and of euormous value to its undeveloped mines. Intelligent management of such an organization would reduce the risk to a minimum and help others in helping itself. In every department of the world's work the old systems have become obsolete. In every branch of successful business new methods are being adopted. There is no disturbance in "the eternal fitness of things." The same abstract principles survive and govern, only the application differs. In mining, the old, easy, "days-of-'49" period is ended. The millions that Califoruia has contributed to the world's permanent wealth are but an index of the vastly greater amount possible to be produced in the manner indicated.

Reports from Curro del Oro, Mexico, are to the effect that 200 miners there employed becoming enraged against their employers struck work, captured and fortified the neighboring town, and defy all authority.

South African mining companies are still in great favor in France and England, and the London mining papers think the boom will last the year out anyhow. Current issues to hand give accounts of several just formed: one, the "Rights and Exploring of Rhodesia, Lt'd," has £100,000 capital stock, has the right to locate 100 claims in Matabeleland, and has paid £25,000 for property. Shares "are confidently offered for £1 each," and editorially endorsed. In connection with this editorial puffing of mines and mining prospectuses, now so common in British mining journals, no less a paper than the *Pall Mall Gazette* deems it necessary to utter a word of warning. It says: "Day by day it becomes more necessary to issue an earnest warning to the public, both in London and the provinces, to beware of the items of mining news put before them in their newspapers. Such reports should be treated with the utmost scrutiny—not implicitly relied upon because they are contained in the pages of an apparently respectable newspaper. Many of these reports, which to the uninitiated reader may appear to be written under the direction of the editor of the newspaper in which they appear, are nothing more than advertisements, and they are advertisements which should be regarded with the utmost suspicion, from the mere fact that they do not pose as such. These puffs are written by the officials of the companies themselves, and their insertion is obtained in the editorial columns by payment—sometimes heavy payment. A reader is often led to believe that a company must have some status, or it would not be so frequently referred to in the journal to which he subscribes. As a matter of fact, it may be that the company merely adopts the rapidly extending practice of making up for lack of status by payment for notice in the news columns of these journals. We know, we regret to say, of at least one list in existence containing the names of over 100 newspapers in London and the provinces whose editors are prepared to sell space in their news columns for the reception of these company notices written by the officials of the companies themselves." It has long been manifest that there are very few journals publishing mining news in England whose opinions could not be bought, and that the fact is now so plainly stated there may tend to stop the publication of wholesale puffery and paid reading matter that is invariably declined by a respectable paper or one that has any regard for public interests.

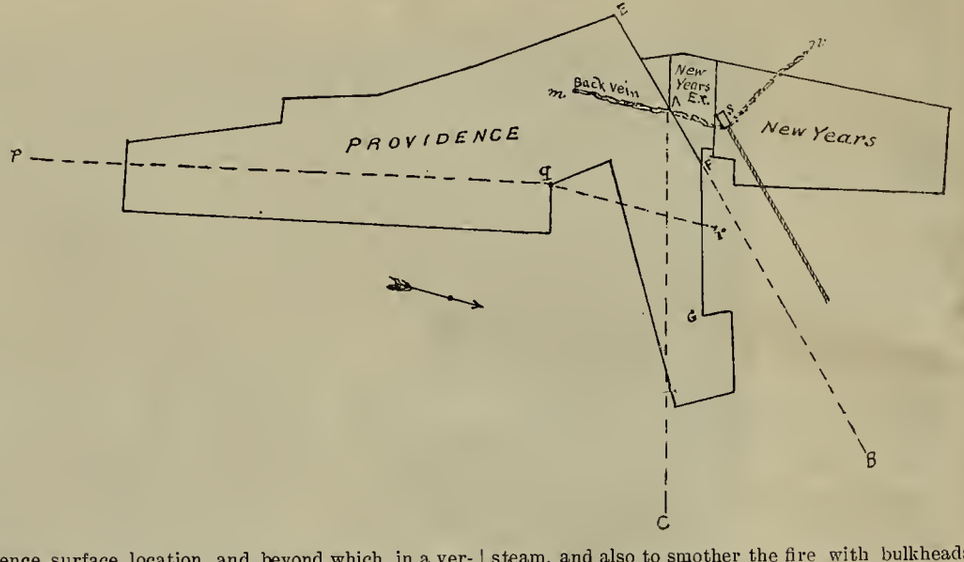
A COLORADO mining broker who has been operating in London and Paris says: "In investing in the United States, foreigners fear most the legal complications which our system of location and apex decisions render so frequent."

ELSEWHERE is given a partial report of the proceedings of the commission of the high court of justice of the Transvaal Republic, which is engaged in taking testimony in Great Britain, Australia and the United States in an effort to determine where cyanide was first employed in the reduction of gold ore. The commission will come no farther west than Salt Lake City. The litigation which gave rise to this commission is extraordinarily costly, several hundred thousand dollars being thus far entailed as costs, making it famous in the list of great patent cases. Yet it is possible that the decision will be indeterminate.

THE new tariff as affecting imported lead ores provides that they shall be "sampled and assayed at the port of entry, according to commercial usage." The Treasury Department asked for bids for this work, and when opeued last Saturday it was found that there were but two proposals, both from El Paso, Texas, both for sixty ceuts per ton. The paucity of proposals—there being fifteen points from which no bids were received,—makes it possible that no effort will be made to depart from the old method, or, rather, lack of method, in this regard. So little lead is imported here, and the little brought from Mexico is so economically handled, that the matter is of little local interest.

CECIL RHODES, the head of the British South Africa Co., is frankly original. Having been asked how his company was going to be reimbursed for its expense in partially explored Mashonaland and Matabelelaud, he said: "By means of a patent. The principle that the company shall get a share of the vendors' scrip has been practically accepted by the country. We have not had the slightest difficulty in settling with the various corporations who have obtained capital from the public. The great objection to the idea was its newness; it had never been done before. It has now been tried, aud has been accepted and for a very simple reason: the prospector has found that he is not eaten up by the monthly licenses while he is holding his claims. The capitalist, when he goes to purchase, knows the charter has a certain interest and pays accordingly, and as to the public, who always find the working capital for quartz reefs, it is a matter of no importance to them whether Jones gets the whole of the vendors' scrip, or whether Jones and the Government share it together. The public do not take such a personal interest in Jones that they desire him to have the whole of the vendors' scrip, and they, at least, know this—that if a half of it goes to the Government it is put away until the proved development of the mine, whereas, perhaps, if it were held entirely by Jones, he might part with the whole of it to a confiding public." That is on the proposition that they shall take who have the power, and they shall keep who can.

The Case Appealed.



On August 13th, '94, a decision was read by Judge Beatty, being that of Judge Hawley in the U. S. Circuit Court in the case of A. Walrath, of the Providence mine, vs. the Champion Mining Co., from which the complainant has appealed, the appeal being filed this week in the U. S. Circuit Court of Appeals in this city, thus reopening a very interesting and important mining suit over valuable property in Nevada county, involving many points of interest to the mining world.

The suit was for $300,000 damages for ore alleged to have been mined by the Champion people on the Providence ground, and for an injunction. After an elaborate statement of the case the judge, in discussing the line F–G, said:

"There is nothing in the facts of this case which gives to complainant any right to extend that line—as a boundary line—any farther than the point G, at which point it comes to the line G–H, which, as before stated, is the northerly end line of the Providence surface location, and beyond which, in a vertical line drawn downward, the complainant had no right to any part or portion of the 'back' vein, either by virtue of the Providence location, patent, Act of 1872, or any agreement or estoppel between the parties. Let a decree be drawn designating the boundary plane fixing the rights of the parties in conformity with the views expressed in this opinion for a perpetual injunction, and for an accounting, if so desired; each party to pay their own costs."

It is from this decision that the appeal is made. The arguments, the claims of both sides, very complete maps of the ground in dispute and the full text of the decision were published in the issues of this paper of June 30, and August 25, 1894.

(In the accompanying sketch the line E. F. B. is the one claimed in the original suit by the Providence; the line A. C., the one claimed by the Champion; the line F. G. shows the boundary fixed by Judge Hawley in the decision, from which appeal is taken.)

COMMISSIONER LAMOUREX of the General Land Office is credited in a Washington dispatch with saying: "I am paying no attention to any protests, no matter from where they come." That is hardly so; he has been overruling protests from the Miners' Association, and from his actious and language is apparently as much of a railroad attache as any other man in its employ, being doubly valuable by reason of his high official position. The idea that he probably meant to convey may be that he does not intend to allow the miners or any one to check his official collusion in the work of wholesale corporate absorption of the mineral area of the State. During the week his dismissal of the protest against the issuance of a patent to the S. P. Co., of 24,901 acres of mineral land in the Los Angeles district, has been appealed from by the chairman of the committee on mineral lands, who in his brief argues the case under the provisions of the rules of the Secretary of the Interior of July 9th, 1894. The argumeut shows plainly that Commissioner Lamourex, who pays "no attention to any protests, no matter from where they come," is guilty of usurpation of power, and that were he to get his just deserts he would at least cease to hold the position he so unworthily fills. The brief is a valuable contribution to this tedious business and will be in the hands of the Secretary of the Interior by the first of next month.

AT 8 P. M., JULY 21, fire started from a miner's candle in the north stope of the Stickle mine, between the Stickle and South Utica shaft between the 800 and 900-foot levels. The property at Angels, Calaveras Co., is the greatest gold-producing mine in the United States, employing hundreds of men, and turning out over $6,000,000 yearly. The men were hoisted through the three shafts without any loss of life. The man in charge, Supt. Lane, showed his nerve and courage. He first saw that everything was done to get the men out; learning that seven men were on the 1100-foot level in danger of suffocation, he, with one assistant, went down into the depths of smoke and gas and flame, found them and got them out in safety. He then tried to force in steam, and also to smother the fire with bulkheads, but that being useless, he ordered the mine flooded, and soon 1300 inches of water were pouring in on the burniug forest of underground timber. Great quantities of immense timbers have been used, it being one of the most heavily timbered mines in the world. The shafts were bulkheaded and all possible vents closed; the water rose in the mine five feet an hour, and before noon on the 23rd the fire was drowned out, the shafts opened, the mine freed from gas, and the pumps at work. The water rose to the 700-foot level, and sufficient ore is procurable, above that, to keep the 120-stamp mill going till the mine is pumped out, which will probably be twenty days. It is thought $30,000 will cover the damage.

A DISTINGUISHED JURIST of this city makes further claims to fame in a novel plea which he advances to the effect that the U. S. Circuit Court of Appeals has no jurisdiction in Alaskan matters. There is a case—the Silver Queen Mining Co. vs. Mrs. Noyes—originally won by a jury trial in Alaska, and now appealed by the latter, the defeated party, to the U. S. Circuit Court of Appeals. The defense moves to dismiss on the ground that that court has no authority because of no jurisdiction; that any legal decision in Alaska is final; there is no appeal; that the Alaskan court is not a constitutional tribunal from which an appeal lies to the U. S. Circuit Court of Appeals, as Congress has provided no jurisdiction as to appeals from that territory. It is probable that it will be found that Alaska, which is a territory of the United States, stands in such matters just as do the other four wards of the nation and that the appellate court has similar jurisdiction.

Concentrates.

THE Blossom mine in Yuma Co., Arizona, is about to be reopened.

DURING June the gold export from the Cape country, S. A., was £990,493.

THE pay roll of the Zeila mine, Amador Co., aggregates $9,000 per month.

THE Calaveras mine, near Sheep Ranch, which has long been idle, is to be reopened.

A 10-STAMP MILL will be put up next month at the Osborne mine, near Westville, Placer Co.

TWO HUNDRED working miners have agreed to organize a miners' union in the Trail Creek, B. C., district.

AT the Mayflower mine, near Nevada City, a 20-stamp mill is building and 3000 feet of water pipe being laid.

THE Rawhide mine is assessed at $222,000; the Utica, $671,000; the Kennedy, $325,000; the Keystone, $29,000.

E. J. MURRAY, of Redding, is the new superintendent of the Green Mountain mine mill, Crescent Mills, Plumas Co.

THE Merrimas, Nevada Co., Company have leased the Pittsburg mill to crush their ore, of which they have plenty.

MOODY & GRANT of the Four Hills mine, near Johnsville, Plumas Co., have let a contract to run 800 feet of tunnel.

GEO. MONTGOMERY, of this city, is about to put a new forty-stamp mill on his Trinidad mine, at Sailor Canyon, Placer Co.

TRINITY COUNTY has not been overlooked by the State Mining Bureau, but will shortly be visited by Mr. E. B. Preston.

LOS ANGELES mining men are visiting the Santa Fe, Riverside Co. mine with a view to buying an interest in the property.

"OUTSIDE" capital is being placed in Russian gold property, several French capitalists having become interested in Ural mines.

THE Nogales, Arizona, *Oasis* declares that gold ore going $200 to $300 a ton is being taken from the Mascot mine in Yavapai county.

SINCE Jan. 1, '95, the West Kootenay mines, according to the Nelson *Tribune*, have shipped 13,415 tons of ore valued at $1,210,072.

THE Greenhorn blue gravel mine has shut down owing to scarcity of water, after a good season's run, and will resume in November.

A HARTFORD, CONN., dispatch says that the Bristol Copper and Silver Mining Company will stop the pumps and allow the mine to fill up.

VIC DORSEY, who is something of an electrician himself, has put in an additional electric light outfit in the Maryland mine at Grass Valley.

T. M. LANE has a five-stamp mill and ten men at work at the Pena Blanca, below Rawhide, recently bonded by Hayward and Lane.

E. H. BENJAMIN will personally superintend operations at the quartz mine he and associates recently bought near Granite Basin, Plumas Co.

THE suit for the recovery of $11,094, amount of wages due employes of the Lockwood mine, has been transferred from Calaveras county to this city.

WILLIAM MARSHALL, while working alone in a mine on Pioneer creek, five miles above Volcano, Amador Co., was caved upon and killed last Tuesday.

THE Dake smelter site on Lynx creek in Yavapai county, Arizona, has been bought by Colorado men, who will build a mill for the treatment of custom ore.

IT has been decreed by the Queensland Government that imported mining machinery shall pay 25 per cent duty; that's the kind of "home industry" people they are.

THE British South Africa Co. has increased its capital stock by issuing 500,000 new shares at £1 each. They are offered at seventy shillings—a premium of £2 10s—per share.

AT the Holmes and Georgene mines, Candelaria district, Nevada, work will be resumed about September 1st. The plant to work the Belleville tailings is not yet built.

AFTER considerable backing and filling the Rawhide deal is off, and Messrs. Nevills, Martin and Billard will, themselves, develop that famous property to a depth of 2500 feet.

THE Omaha Gold Mining Company last week declared dividend No. 33: 15 cents per share. Geo. Maiuhart, the superintendent, is having considerable development work done.

THE *Tribune* says the Niagara tunnel has now pierced the mountain 2589 feet, where the drills are gnawing into the hardest kind of rock. Meanwhile both mills are running on ores.

THE Tres Amigos mine at Oro Blanco, Arizona, is reported showing up finely. The shaft is down 100 feet on a five-foot vein, the ore being free-milling gold of low grade, but profitable.

THE owners of the Thistle shaft, at La Porte, employing 105 men, are discussing the proposition of establishing two additional plants to open up the property from the Plumas county side.

THE *Monitor Sinaloense* bears that Senor Francisco Peraza, of San Jose de Gracia, has sold his mine in Sinaloa, the Santa Tomas, to the Anglo-Mexican Mining and Milling Company for $150,000.

THE United States Debris Commission last Monday granted a permit to the proprietors of the Charcoal Ranch mine, near Sierra City, and to D. O'Keeffe for a dam for his mine in that vicinity.

J. ISGRIG and R. A. Heim have bought the plant of the Mammon Gold Mining Company at Otis, Pinal county, Arizona. They intend to open up the mine at once, and put in a mill later.

THE Kinkead Milling and Mining Co., a Nevada State corporation, has bought the waste dumps of the Con. Cal. & Va., at Virginia, Nev., and intends building a concentrating plant of 100 tons daily capacity. They claim to have a process by which they can make money out of such immense waste heaps as dot the Comstock. The idea appears feasible.

A FOUR-FOOT vein of magnetic ore is said to have been discovered in Big Bug district, Yavapai county, Arizona. The ore is reported a fine flux carrying about $10 per ton in gold and silver.

THE *Ledger* says that the gross output of the Utica Mining Company at Angels for June was one million dollars, nine hundred thousand of which was paid out to the stockholders in dividends.

J. B. SELLIER is driving a tunnel at the Mountain Chief mine in just expectation of striking the same gravel channel now being mined by Supt. Power at the Sunny South, two miles distant.

THE Cincinnati Belle mine, located between Perris and the Good Hope, Riversido county, is reported to be showing up a good body of paying ore. They are down 100 feet and drifts are being run.

THERE never was so much activity in mining in Montana as at present. That seems to be the general opinion of mining men, mining brokers and dealers in mining supplies, says the Helena *Independent*.

AT Florence, Arizona, a trial run of a thousand tons of ore from the Ripsey mine is going to be milled. If the experiment proves satisfactory a ten and perhaps a twenty-stamp mill will be erected.

VICE-PRESIDENT SHAUGHNESSY of the Canadian Pacific railroad has been visiting West Kootenai, and says his company will probably construct several branches and give facilities for transporting ore.

A 114-FOOT tunnel is being run in the Eagle mine, near Grizzly Flat, El Dorado county, and if, as is confidently expected, a good body of ore is struck, it is the intention to build a twenty-stamp mill.

DURING the year ending June 30, '95, 212 barrels of sweepings were collected at the U. S. mint in this city, and sent to the Selby Smelting Co., who, last Tuesday, sent Superintendent Daggett $6370, net results thereof.

DR. BOYSON of the Pioneer mine is going to France, and it is probable that before his return he will have transferred some Amador county gold property to Messrs. Choisy and De Bourgade, who lately visited that vicinity.

THE Helena assay office last Monday received the biggest single deposit of gold dust ever made there, being over 3000 ounces, worth $54,000, being the first shipment for the season from the placer mines on the Yukon, Alaska.

H. A. STEVENS has twenty-six placer claims, of 20 acres each, on the north side of Josephine creek, Oregon, some of the gravel in which goes 60 cents per yard, and proposes to spend $17,000 in ditching and getting ready to work.

THIS week a 24-ton capacity Huntington mill was shipped to O. B. Amsden, Supt. Gold Bug mine, who will put it in operation about one mile above Brown's mill. The engine is 30 H. P. The mill will treat Gold Bug and custom ore.

THE Horseshoe Mill Power and Mining Company has incorporated at Merced; capital stock, $50,000; A. G. Clough, G. E. Nordgren, O. F. Giffin, Merced; J. F. Thorn, J. J. Marshall, Hornitos. The property is in Hunter's valley, Mariposa Co.

THIS time it is Prof. Hunicke of the Washington University, St. Louis, who is applying for a process by which, he claims, $10,000 worth of gold can be obtained from sea water at a cost of $1, every ton of water yielding from 2 to 4 cents' worth of gold.

THE Nevada Co. Electric Power Co. figures its ability to furnish power to mines in Nevada and Placer counties for $100 per H. P. annually. The plant now in process of construction is intended to develop 2500 H. P., and will cost about $75,000.

THE Arizona mining papers, as an aftermath of the silver "boulder" near Peach Springs, are having a discussion as to the weight of a ton of pure silver at one dollar per ounce. The statements vary from $80,000 to $29,160, which last, so far, is nearest the fact: $24,000 would be still nearer.

PLUMAS COUNTY'S ancient river channels are again attracting attention. Some San Jose men, including Tyler Beach, are about to develop the Elizabethtown channel, and Messrs. Doolittle and Sharon have the Franklin and Beckwith Consolidated bonded for $150,000.

EXTENSIVE preparations to work the placer claims of the Monitor Mining and Investment Company at Gila City, Yuma county, Arizona, have been completed. The company intends adding to its present hydraulic plant and sluicing the auriferous gravel of that section for all there is in it.

THE executive committee of the State Miners' Association met in this city last Monday evening. The question of funds was discussed and a recommendation made that the committee on protection of mineral lands take action toward getting the whole matter before Congress at its next session.

THE Poorman, Idaho, mine is just about making expenses, owing to the low-grade character of the ore and the low prices of lead and silver. There is a debt hanging over the property which the owners hoped to pay off by keeping the property in operation, but some of the owners are in favor of closing down.

THE statistics of the California gold yield for '94, by counties, exhibit a handsome increase, aggregating a million dollars more than that of the preceding year. As before published, the total is considerably over $14,000,000. From present appearances it seems that the '95 total will be close on to $16,000,000.

FROM Tucson it is reported that arrangements have at last been made whereby the smelter below the town may be started again. Copper ores are again being purchased. Richard Hamilton is in charge of the smelter. The Silver Bell and San Xavier districts are expected to furnish most of the ore purchased.

THE annual statement of the Parrot Silver & Copper Company, of Montana, shows the amount of the capital stock of the company is $2,300,000, all paid in. The amount of the existing debts on June 1, 1895, is given at $111,591.35. The statement is signed by Franklin Farrel, president, and J. E. Gaylord, A. M. Holter and A. J. Davis, trustees.

COULTERVILLE, Mariposa Co., reports lively times. There are nearly 1000 people there, many doing business in tents by reason of the scarcity of houses. The Merced Mining and Milling Company is working 175 men, the Pyxo 45, the May Harrison 35, the Red Banks 50. Many substantial improvements are projected and considerable new machinery is going in there.

THE English company, who recently secured control of the nickel mines at Lovelocks, Nev., have about completed their $75,000 plant and intend beginning operations next week. Reports say the ore goes from ten to forty per cent nickel, which is unusually high. It is understood that if the smelting tests are successful that Chas. T. and W. S. Bell, who have worked it for fourteen years, will be paid $200,000.

DURING June the Alaska Treadwell mine crushed 22,823 tons of ore and treated 384 tons sulphurets. The ore averaged $3.57 per ton. A shipment of $81,432 arrived this week. A $75,000 dividend will be paid next Monday. During June, the Alaska Mexican mine crushed 6614 tons averaging $2.65 per ton; 134 tons of sulphurets were treated. The expenses of the month were $10,500. A 15c per share dividend will be declared next week.

A HALF interest in the San Fernando copper mine, San Diego county, has been sold to Gen. E. C. Humphreys, acting as representative of capitalists of Colorado Springs and the Woods Investment Company of Victor, Colo. A stock company has been organized, known as the San Fernando Mining and Smelting Company, to develop this mine and others controlled by the company. A large quantity of ore is reported in sight, which will be worked at once.

MESSRS. OVIEDO, Salgado and associates are reported to have discovered some very rich gold mines in Lower California about four miles from the west coast of the peninsula, between the 30th and 31st parallels of latitude. The area taken up is very extensive, and as soon as title is complete, operations on an extensive scale will begin. *El Trafico* says Nogales capitalists have been interested, and that an American company will be organized to operate the new properties.

IN reference to the discovery of gold on Anacapa Island, in the Santa Barbara Channel, reported some time ago, M. Buol, mining engineer, who was sent to examine it, reports that there is every evidence of good-paying ore on the island, but recommends further examination, and that mill tests would be better than to rely on assays. Messrs. Pratt and Storke, who made the discovery and location, intend sending out another party to the island to look deeper into the matter.

ONE hears and reads a great deal about hard money, paper money, white money, yellow money, wildcat money, etc., but few communities have all these different varieties in circulation. On the first of July the Emmett, Idaho, *Index* claims to have received white money on subscription, yellow money on an advertising account, a ragged paper bill for change, and towards evening a man came in and planked down a half-grown wildcat, teeth, claws, and all, and demanded a year's subscription. They are all legal tender in Emmett.

THE following is from the New York *Recorder* of the 20th: "The phosphorescent effect of fungi upon the old bark of decaying trees is well known; but it is not so thoroughly understood that there is in California and Nevada a rare tree known as the 'witch tree,' from the way in which every limb, twig and leaf stands outlined in the darkest night by some peculiar phosphorescent quality of the bark. A large tree of this species is estimated to furnish light equivalent to 100 electric lights of standard sixteen-candle power variety, and a few small towns in the foothills have planted witch trees on street corners as an economical means of municipal illumination."

J. A. POLLOCK, of Salt Lake, Utah, says an American reproduction of the Johannesburg cyanide gold fields exists in the Mercur district, where a continuous vein of gold-bearing rock stretches like a blanket immediately beneath the surface of the mountains and following their contour over an area ten miles square. Scientific theory has not yet established the nature of its origin. The ore body consists of decomposed quartz and magnetic iron oxide carrying fine gold, yellow quartz sand and fine silt, with traces of cinnabar, considerable arsenic in places which have escaped oxidizing, but no silver, copper or lead. The hanging and foot walls alternate between hard shale and blue limestone. Evidence is patent everywhere that the region in which the vein lies was once submerged beneath the waters of old Lake Bonneville, the precursor of the present Great Salt Lake.

THREE smelters are talked of in the West Kootenay, B. C., region. One at Nelson, to be erected by the Hall Mining Company for the smelting of the Silver King ore; one on a new site, near Bannock point, at the head of Arrow lake, to be erected by the Kansas City Smelting Co., under the patronage of the C. P. R.; and one at Trail creek by a Montana company, for the smelting of Trail creek ores. This is partly occasioned by the Dominion Government, which is about to give a "bonus" for the establishment of smelters, to be a sum not exceeding $30,000 per annum for five years to be paid for all ore smelted in Canada at a maximum of 50 cents a ton; smelters must be blown in before the first of next July. At present the Pilot Bay smelter is the only one going. Its capacity is 100 tons a day, which would exhaust about half the bonus. If another 100-ton stack is put up, that would absorb the other half of the bonus at its maximum of 50 cents a ton. A large customs smelter of 200 tons a day capacity would reduce the bonus to 25 cents a ton all round at once, making the inducements appear insufficient.

THE tsetse fly, so fatal to draft animals throughout large districts of South Africa, is at last defeated. A railroad is in operation across the fly belt that intervenes between the sea and Mashonaland. When the Masbonaland boom began, some Englishmen thought they would make their fortune by carrying gold-seekers from the coast to the gold fields. They sent a lot of horses and a half-dozen fine new stage coaches to Beira, on the sea, and advertised in the English newspapers that they were ready for business. A party of gold diggers went down the Portuguese coast to take the new short cut to the gold country. Great was their dismay when they learned at Beira that every horse had perished in the fly belt and the stages were stranded there. These vehicles, now mildewed and molderiug, are still seen on the road where they were abandoned—a melancholy illustration of the fact that discretion and knowledge must go hand in hand with enterprise to make it pay. The iron horse gets through. In its triumphant progress it pays no attention to the swarms of the extraordinary insect that never before saw the pack or wagon train it could not destroy.

Metalliferous Deposits in Fissures.

Written for the MINING AND SCIENTIFIC PRESS by MELVILLE ATWOOD.

Lode.—The term lode is exclusively applied to metalliferous deposits which only occupy very *limited portions* of pre-existing fissures, or fractures met with in igneous or sedimentary rocks. By the term "true fissure vein" is meant ore deposits in well-defined fissures, so that in the examiuation of a mine, in the first place, the study of the euclosing rocks and the character and occurrence of the fissure is absolutely necessary.

Arranging rock species according to their structures, it will be found that most rocks fall naturally into one or the other of two great classes: First, Primary or eruptive rocks; second, Secondary or sedimentary rocks. I use the term primary and secondary quite independently of geological chronology.

1st—Primary or eruptive rocks. This class includes rocks which have make their appearance in many, if not all, epochs, from the most ancient to the most recent, from the old granitic outbursts to the eruptions of the now active volcanoes; and if, as is now generally admitted, the earth be regarded as having once been a molten sphere, the consolidated original crust of the globe would pertain to this class of rocks.

The 2d class—Rocks pertaiuing to this class are all directly or indirectly formed from the breakiug up or debris of previously existing rocks. When found in the normal state of sedimentary deposition, they may he conveniently subdivided into:

1st—Rocks formed of the immediate products of the hreaking up of eruptive rocks.

2d—Rocks built up of the more or less rounded or angular debris of previously existing sedimentary rocks.

3d—Rocks composed of mineral substances extracted from aqueous solution by crystallization, precipitation or the action of organic life.

A large portion of fissures, or cracks in the earth's surface, are formed by intrusive igneous rocks, termed "dykes," which have penetrated both *igneous* and sedimeutary rocks *long after they were in place*, and the spaces between intrusive rocks and those in place form the fissures.

These dykes vary very much in thickness, both in a vertical and in a horizontal direction, and they frequently die out before reaching the surface, so that absence of continuity in the outcrop is no proof of a want of continuity underground.

Another class of fissures or cracks are caused hy the disturbance of the equilibrium to which the crust of the globe has been periodically subject. Also to different points of a giveu area having been acted on by unequal or subsident forces, generally accompanied by alterations of level, the effect of which is that points on the two sides of the fissure which coincided before are no louger opposite to one another, so that in stratified rocks the amount of displacement is easily seen and measured.

In the examination of a gold mine, it is of the greatest importance to find out what is the average width and hreadth of the different chimneys and pay shoots, also the course aud angle of dip of the pay shoot from the horizontal.

The length of the auriferous pay shoots in different fissures on the line of strike or course of the fissure varies from fifty to some hundreds of feet. The auriferous shoots or quartz matter, after consolidation, contract, and even in the narrowest quartz shoot there is evidence of their shrinkage, allowing the running down of rain water from the surface; and though those portions of the fissure not occupied by quartz may to some extent dam up the water, yet the pay shoot will be the channel hy which it will find its way to all the lower workings.

A great deal has been written respectiug the filling of auriferous matter iu the shoots, chimneys, etc., which occur or occupy such limited portions of different fissures; but in case a careful examination is made of the condition of the gold and gangues, the fact of their having been precipitated from aqueous solution will be too apparent to admit of contradiction.

The Mineralization of Gold.—The telluride of gold is the only ore of gold that so far has been met with in any quantity, and then it is mostly found in what are termed "pockets." But should it he so disseminated in the lode matter as not to admit of assorting, the plan I used at the San Jose mine, Minas Geraes, Brazil, can be successfully adopted, namely, to roast the lode matter in heaps, with cord wood so arranged as not to overheat or slag it, and then pass the roasted matter through the stamps.

The two principal gangues of gold are quartz and pyritic matter. The gold sometimes is found crystallized in crystals of the quartz, and beautiful crystals are frequently to he seen deposited on the faces of the pyritic crystals. I have a specimen of placer scale gold, water worn, in which the scales are imbedded in pyritic matter.

Some Concluding Considerations.—The terms "vein" and "ledge" without addition or qualification have a very broad signification. For instance, veins of granite, non-metalliferous rocks or fissures filled with silicious matter, cale-spar or other minerals, are called veins or ledges. Lava dykes are also termed veins. The term "auriferous slates" is very misleading, and is only used by those who have no practical knowledge of gold mining. Slates are sedimentary rocks.

In the *Scientific Apparatus and Literature* for Dec. 15, 1893, is an article "On Electric Phenomena," wherein is the following: "Professor John Trowbridge, in the course of an extensive series of experiments carried out between Cambridge and Boston, U. S. A., found that the earth was full of electric currents, and that at no point explored was evidence of earth currents absent. They were, however, most pronounced along water courses.

"Many years ago R. W. Fox, F. R. S., wrote: 'If electricity be evolved when several differeut mineral substances are brought into contact, and likewise in the process of crystallization, etc., may it not in connection with the strata and veius, and the almost distinct portion of water which abounds in the earth, also act its part on a larger scale, and not only excite heat, but contribute to produce the extraordinary aggregation and position of homogeneous minerals in veins, etc., and the beautiful order which exists even under the surface of the earth?'

"Mr. Fox's theory, which certainly seems to be borne out by his observations, was that these crevices were very deep and contained more or less saline water, which, owing to differences of temperature in the earth's crust, was kept continually circulating, thus inducing and intensifying chemico-electro-magnetic actiou in *rocks*, attracting the minerals which were deposited in the crevices."

There is much to be said in favor of this subterranean electric force as an agent in various phases of metamorphism.

By long and careful experimentation, Mr. Fox found that the potential of rocks below the surface varied in a high degree, some being negative and others positive. He moreover discovered that there were decided electric curreuts in the mineral veins themselves. By placing a wire in contact with an ore point in the vein and the adjacent rock, and counecting it with a prepared bath at a considerable distance, these subterranean currents were sufficient to produce an electrotype copper plate. Professor R. Hunt states in a paper ou "The Electricity of Mineral Veins," in the tenth report of the Cornwall Polytechnic Society, that he succeeded by means of these electric currents in mineral veins to magnetize a horseshoe. But the great interest of Mr. Fox's work was the proving that the curious arrangement of crystals iu some ores, the transformation of metals and their separation, is due to magueto-electrical earth currents.

The Mother Lode.—This term, without addition, would signify a contiuuous fissure for a distance of nearly 100 miles, and filled with metalliferous deposits. The fact is, however, that there are a number of parallel intrusive igneous dykes, some of them a considerable distance apart and partaking of what are called and described as composite dykes by Prof. J. W. Judd, Esq., F. R. S. (Professor of Geology in the Royal College of Science, London) in his able and highly instructive paper read before the London Geological Society, June 21, 1893:

"1st. Definition and Classification of Composite Dykes."

"Those dykes which are filled with materials differing one from another in chemical composition or mineralogical constitution may be conveniently spoken of as 'composite dykes.' In some cases the diverse rocks found in the same dyke may be only varieties of a single type, exhibiting dissimilarities in the proportious of arrangement of their several mineral constituents, hut in other cases two or more rock species absolutely distinct may he found to enter into the constitution of a single dyke. A careful study of these composite dykes shows that they fall naturally into two classes, as follows:

"A. Composite dykes in which a differentiation has gone on in the material that has filled the dyke.

"This differentiation usually results in the separation, or partial separation, of the vitreous base of the rock from the crystallizing process, acting selectively within the dyke, and has led to the formation of rocks which, in different parts of the dyke, show marked variations in chemical composition or texture and even in mineralogical constitution. The separation of the glassy from the crystalline materials in this variety of composite dykes takes place in various ways. The vitreous material may form lateral bands (selvages) or irregular patches, or it may fill 'amygdaloidal cavities.' But in all cases there is found to be more or less perfect gradation from the one type of rock to the other.

"B. Composite dykes in which there has been injection of different materials into the same fissure.

"In these the later injected rock, though it may contain minerals and fragments derived from the older injection, exhibits no trace of gradation into it, hut can always be recognized as another type of material distinct in chemical composition or mineralogical constitution. In such cases we may infer that differentiation must have taken place in the magma deep dowu in the earth's crust and far below the fissure which is now filled with the two products resulting from the differentiation. While, however, it is probable that such composite dykes are usually filled with materials coming from the same subterranean reservoir, it is possihle that, in certain exceptional cases, a dyke may he reopened in such a way as to allow of molten material from a source totally differeut from that which supplied the earlier injectiou fiuding its way into the fissure. In such exceptional cases the composite character of the dyke must he regarded as an accident.

"In many instances the younger injection is found occupying the center of the dyke, for, owing to the cooling of the mass from the sides, a plane of weakness (often very manifest in columar dykes) may origiuate along the middle of the dyke. In this plane, indeed, contractions due to crystallization not infrequeutly leads to the formation of numerous cavities. But there are other instances where the junctious between the dykes and the enclosing rock constitute planes of weakness, along which the later ejected material has forced its way. In such cases the rock occupies the center of the dyke."

The reason why I have quoted so largely from the papers by Prof. Judd and others on intrusive igneous dykes is that I consider the study of them of such great importance to the miner.

The results of my examination of specimens taken 100 feet east of the Keystone main shaft are as follows: A hasic igneous rock, dark greenish color, specific gravity 2.800, contained silica about 45 per cent. Under the microscope the following minerals were found: Oligoclase, albite, anorthite, chlorite, pyreue (angite), labradorite, and as accessories magnetite and pyrite.

These intrusive dykes causing fissures called the "mother lode" are igneous rocks ejected in a melted state from a deep-seated source of fire through spaces made by the fracturing and raising of the beds of slate and other sedimeutary rocks from their horizontal position, the sedimentary rocks having been a very long time in place before the intrusion, the slate at the time having what is termed the cleavage structure. (In many instances writers have confounded cleavage with stratification.)

In proof of the condition of the dykes at the time of their intrusion, Prof. John Phillips, F. R. S., in his treatise on geology, remarks, when describing the dykes in Newcastle and Durham: "In working the coal toward the Cockfield dyke, when within fifty yards of the dyke the coal begins to change. It first loses the white spar in its joints and faces—loses its quality for producing flame. Nearer the dyke it has the appearance of half-burnt cinder. Eight yards from the point at which the coal becomes a real cinder—that is, eight yards nearer the dyke—the coal assumes the appearance of soot caked together."

The different fissures on the rauge of what is called the "mother lode," and limited portions of which are filled with auriferous deposits, are not all of them the cracks or spaces between the dykes and sedimeutary rocks, which dykes sometimes form what is termed the hanging, and in others the footwalls of the fissure. but fractures in the sedimentary formations parallel to them but at a considerable distance, and the result, no doubt, of the upheaval aud fracture by the intrusive rocks, small fragments of which are met with in many of them, and without question they have derived their minerals and auriferous contents from the same deep source.

I have been engaged for very many years in the working of gold, silver, copper, zinc and other mines, and the results of my investigations during that time, and from reliable information obtained from some of the best authorities, I have come to the conclusion that the different fissures, in portions of which are metalliferous deposits (that these fissures) have been the outlet of metallic and mineral vapors from deep-seated sources, which, in their passage upward, accumulated from the different formations a large proportion of their contents, and on nearing the surface were condensed aud took a liquid form. They were also then mixed with metals and minerals already in solution and derived from rocks still nearer the surface. A large proportion of the metals and minerals in the combined solution were then precipitated on congenial rocks or minerals by electro magnetic currents, which are known to be so strong in all fissures, particularly when there is considerable moisture.

We know that lodes are richer near the coutact of plutonic and stratified formations, especially where the former sends dykes into the latter.

In auriferous deposits the shoots and pipes, or chimneys, appear to have been the channels by which the metals and minerals were brought to the surface and which may account for the large bodies of quartz occasionally met with on the surface.

The question is often asked, do auriferous deposits decrease in richness as depth is attained? It all depends on the situation of the mine and the character of the enclosing rocks. The richest and most productive part of the Comstock fissures, so far, has been that above the level of the Sutro tunnel, though, curiously enough, in my collection I have specimens of ore taken from the outcroppings of the Ophir mine, and from the 1650-foot level of the Consolidated Virginia mine, which are so much alike

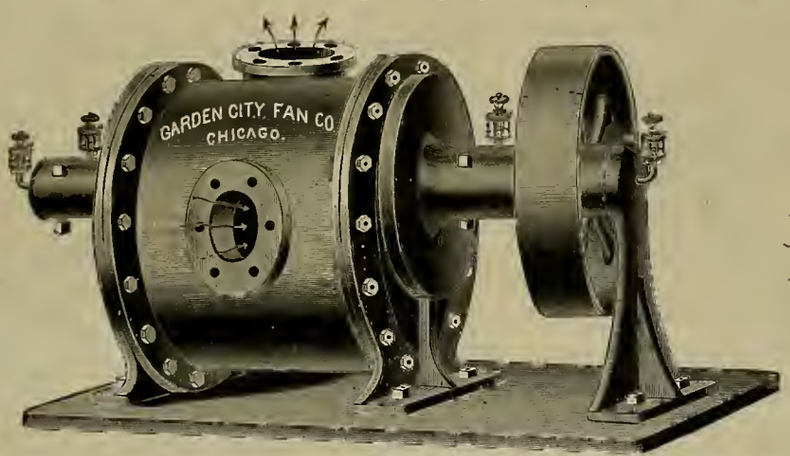
that they appear to have been broken from the same piece of ore.

The gold mining business in California has seldom looked brighter than at the present time; old abandoned mines being now opened out and worked with success; water, improved methods of extracting and milling the rocks, cheaper labor and reduced cost of supplies enabling the miner to work rock to a profit for what it cost him to mill it in the early days.

I feel confident that if the same amount of capital that is now being spent in the African gold mines was *judiciously invested* in our California gold mines, that the results would be so satisfactory as to again attract miners from all parts of the world.

An instance of the results of judicious investment of capital in California was the Eureka mine. The enterprising Jules Fricot purchased it, and in 1864 sunk a perpendicular shaft to the depth of upwards of 100 feet, which intersected the *pay shoot* at that depth. He then built a quartz mill, and erected hoisting and pumping machinery. He afterwards disposed of part of the property to a San Francisco company, who took out $5,700,000 from the claim, a large proportion of which was paid in dividends.

The Idaho and Maryland claims are a continuation of the Eureka pay shoot, and in the same fissure. The Coleman Bros., to whom Grass Valley is so greatly indebted, first bought the abandoned "North Star" mine, made a success of it and then sold it for a large sum of money. They then commenced work on the Idaho, which by good management has proved so far to be the richest mine in California, yielding in the neighborhood of $12,000,000, and it is said nearly one-half of that has been paid in dividends.



No mining capitalist on this coast has developed richer gold mines than Alvinza Hayward, Esq., and his operations have not been confined to a few localities. With good judgment and practical knowledge, he has opened out old abandoned mines, and with the aid of improved machinery made them good paying concerns, for instance the Utica mine, the output of which for a considerable time has been greater than the richest of the African gold mines.

Up to the present time the total length of all the cables laid is said to be about 157,713 nautical miles. Most of these cables have only one core, but some have two or more. The total length of core in the above-mentioned length of cables is about 166,900 nautical miles. Of this length 165,000 is insulated with gutta-percha and 1900 with India rubber. The approximate weight of gutta-percha used in the above insulation is 23,000 tons for the 166,900 miles. The approximate weight of India rubber is about 152 tons. Besides the above-mentioned submarine cables there must be some 100,000 nautical miles of cables laid by various governments and States for military defense. The longest stretch of cables are, of course, those running across the Atlantic to North and South America, and the shortest across the English and Irish channels, and between Java and Sumatra and Athens and Corinth.

A New Positive-Pressure Blower.

Herewith is illustrated a positive-pressure blower, a radical change from anything heretofore made, and novel in its construction. A difficulty experienced with most positive blowers is in the gearing. The life of the ordinary gear is comparatively short, and when it finally succumbs it rarely gives warning. There is a demand for something that will do the work without the use of gears or intermeshing revolvers, or internal parts that depend upon the gears to preserve proper contact or alignment, which is absolutely a requisite to obtain results. The sectional cut of this blower shows that there is an entire absence of any gear. It is as simple internally as the ordinary fan blower, but does not depend upon a high velocity to obtain pressure, being positive at any speed. All the air that enters inlet is effectually pocketed and forced forward, with no opportunity for backward escape, until finally delivered at the outlet; if the outlet is closed the blower will stop.

The blower has been placed upon the market after numerous experiments. Another important feature that will commend itself is the fact that this blower is practically noiseless, and requires less power than other similar machines. It is made by the Garden City Fan Co., Chicago, Ill.

A NEW POSITIVE-PRESSURE BLOWER.

Dry Placer Machines.

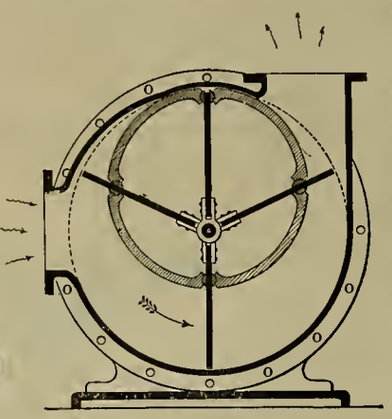
It is a great trick to handle a dry pan well—wet washing is nothing to it—and the Mexicans down in these Arizona diggings manage it with the swiftness and skill of a prestidigitator, says "Fitz-Mac" of Prescott, Arizona, in the Denver *News*. You can scarcely follow them with the eye to learn the knack of it, so rapid are the movements—tossing, twirling, deftly shaking with little jerks that send the gold toward the bottom and leave the coarser sand and gravel at the top to be pitched off with a magical flip, a turn of the wrist done in a twinkle of an eye, which, repeated and repeated so rapidly that your gaze is confused by the motions, soon eliminates all but a spoonful or two of the heavier iron sands. This is now kept in the air by skillful tossing while he blows upon it with his breath to drive off the fine dust and any large particles of light sand, adjusting the draught with scientific accuracy to the relative weight of the gold and the iron sands that always, more or less, accompany it in either dry or wet panning.

It is now ready for the quicksilver, and with another flip he tosses it into a can containing more of the same, to be amalgamated at his leisure when he has a lot of it. But if he chances to be out of quicksilver, he can blow it with his breath almost down to pure gold by taking a little more time and care, so perfect is his skill and so accurately trained his eye to measure the weight of the particles of gold he is handling and bring just the right draught to bear upon them. This is only in panning; but, as a matter of fact, the pan is very little used in dry placering, except as it is used in wet placering, to prospect and to fine down the product of whatever simple machine may be employed.

The little machine employed in dry placering, and which takes the place of the old rocker of wet regions, is a small affair—so light that a miner can toss it on his shoulder and carry it from one position to another. It is built very much in shape and employs exactly the same mechanical principles—a series of graded screens and a fan blast—as the fanning mill used on farms to clean grain, except only that the last screen is a piece of muslin with wires stretched across it to aid in retaining the gold. The draught is forced through this cloth and must be regulated according to the conditions of the dirt and the gold.

For the benefit of readers who are not miners, I may mention that the success of the operation depends on the fact that gold is from two to five times as heavy as most of the accompanying dirt, so that a draught strong enough to blow the dirt away will leave the gold upon the cloth with a small quantity of the heavy iron sands, from which it has to be separated by quicksilver. The gold being heavier than quicksilver—about as 19 to 13—readily sinks in it and forms an amalgam. The iron sands, being lighter, float upon the quicksilver and are easily blown or brushed off. Quicksilver volatilizes at a very low heat and is thus driven off as a gas in a retort and precipitated for repeated use, so that it is not very expensive nor very troublesome.

To work one of these little dry washers to advantage requires two men, just as it does to work the old wet rocker—one to shovel the dirt into the hopper and the other to turn the fanning wheel by a crank with one hand and keep the screens from clogging with the other.



There are innumerable patented dry washers, but the little machine I have described employs none but old and well-known mechanical principles and I presume cannot be patented. At least, I know the miners down here make most of those used themselves. A man handy with carpenter's tools, and having a pattern at hand, ought to be able to make one in a day at an expense of $5 for materials.

They are very efficient little contrivances and one would think they might be easily improved to work on a large scale, but so far as I am aware all attempts to do dry placering on a large scale by machinery have not proved successful in general practice. The trouble probably is that, being heavy and cumbersome, they cannot be easily, quickly and cheaply moved about and adjusted to meet the ever varying conditions of the placer field.

Placering by the dry method can only be successful in an arid region, where the ground is as dry as flour. The least dampness interferes; therefore, one can see the method is not of very extended use. But it is used all over Arizona more or less, and in the State of Sonora, Mexico, which lies directly south and is similarly conditioned, being even much more arid, hotter and very rich in placer grounds, which are now worked extensively by the dry method.

I should say as a likely guess, though I have no statistics to back it, that nearly as much gold has been recovered by the dry method as has ever been recovered in Colorado by the wet. But Colorado has always possessed the knack of making a noise in the world. Just about the time the country was wild over the placer grounds of Gregory and Russell gulches and Spanish Box up Clear creek, Arizona was producing by dry washing in the La Paz diggings on the Colorado river more gold than Gilpin county. Yet the fame of Gilpin county filled the country, and outside of La Paz one scarcely heard of La Paz, though if tradition may be trusted 500 or 600 miners were placering there and turning in $100,000 a month—about $200 a month to the man—so it is evident they made wages. They were Mexicans mostly. The inhabitants of that district still are mostly Mexicans, and several scores, if not a couple of hundred of them, still remain about the old diggings and make a living by dry washing.

The turning back of the waters of the Red sea by a strong wind, as told in Exodus, was repeated this last spring in presence of Mayor Tullock, who has reported the facts to the British Government. A wind arose so violent that it drove all the waters back, leaving the sailing vessels stranded on the saudy bed of the sea. This is the Bible description, and the time of year when it occurred was the same as when the Israelites made their exodus from Egypt 3500 years ago.

Of the 11,621,530 square miles that Africa comprises, England now holds 2,194,880. France has 3,326,790 square miles, including Algeria, Tunis, and a large part of the Sahara; Germany, 884,810, the greater part acquired since 1884; Portugal, which at one time had almost a monopoly of Africa, now owns only 826,730 square miles; Spain holds 153,834, chiefly on the Sahara coast, and Italy 548,880. The Congo Free State contains 905,090 square miles, and the Boer Republic 177,750. Europe has already seized upon more than three-fourths of the continent.

How We Go to Sleep.

"Order is Heaven's first law," and the truth is manifested even in the process of going to sleep. When a man drops off to sleep, says the Cincinnati *Medical Journal*, his body does not do so all at once, so to speak. Some senses become dormant before others, and always in the same order. As he becomes drowsy the eyes close and the sense of seeing is at rest. It is quickly followed by the disappearance of the sense of taste. He next loses the sense of smell, and then, after a short interval, the tympanum becomes insensible to sound, or rather, the nerves which run to the brain from it fail to arouse any sense of hearing. The last seuse to leave is that of touch, and in some hypersensitive people it is hardly ever dormant. Even in their case, however, there is no discriminating power or seuse of what touched them. This sense is also the first to return upon awakening. Then hearing follows suit, after that taste, and then the eye becomes able to flash impressions back to the brain. The sense of smell, oddly enough, though it is by no means the first to go, is the last to come back. The same gradual loss of power is observed in the muscles and sinews as well as in the senses. Slumber begins at the feet and slowly spreads up the limbs and trunk until it reaches the brain, when unconsciousness is complete and the whole body is at rest. This is why sleep is impossible when the feet are cold.

The MacArthur-Forrest Patent Commission.

The commission sent by the South African courts to gather testimony evidence in the case of the MacArthur-Forrest patent for the extraction of gold by cyanide, got as far west as Salt Lake, Utah, and then returned to New York.

The commissioner-in-chief is E. Kent. With him is T. W. Goad of Denver, manager of the Gold & Silver Extraction Company of America; W. D. Edwards of New York City, of counsel for the patentees; J. N. Sparks of London, a MacArthur-Forrest engineer; C. W. Truslow and Dr. H. Wurtz of New York, representing the South African contestants.

The commission is at the instance and expense of the owners of the MacArthur-Forrest patents; its object is to present to the courts of South Africa the testimony of practical American mining men and mining engineers regarding the MacArthur-Forrest cyanide patents, and the general applicability of their process to American low-grade, gold-bearing ores. This commission began its sittings in New York, adjourned to Denver, then to Salt Lake, and then back to New York.

The litigation over these patents involves the expenditure of hundreds of thousands of dollars. The cost is probably greater than that in litigation over the Bell telephone inventions. The English High Court of Appeals, composed of three judges, has decided unanimously in favor of the patent for the dilute solution of cyanide, reversing the judgment of the court below. There is, however, still pending the suit referred to in the South African courts, and also a suit against the Mercur Mining & Milling Company of Salt Lake.

The process has been used in a modified form in working the gold ores in Mercur district, and the owners of some of the claims in that district contested the right of the company to exact a royalty for the use of the process, generally known as the MacArthur process. It was this suit which was recently heard before Judge Merritt, the case of the Gold & Silver Extracting Company of America vs. the Mercur Gold & Silver Mining Company. Judge Merritt sustained the demurrer to the complaint, and gave leave to file an amended complaint.

The first witness was E. C. Steen. The commission had traveled 3000 miles to hear his story of the cyanides of potassium as he had applied it to the extraction of gold while conducting the Union mine in Amador county. For forty-five years the witness had resided in this state. He had come here in 1850, and had ever since been directly or indirectly, he testified, connected with mining and the manufacture of mining machinery. In 1864, he purchased the Union mine, and, having operated it for some four or five years, turned it over to John J. Haley and his associates. The mine was subsequently relocated by Eli Gardner, who had been in witness's employ in former years, put in condition for sale and disposed of to prominent brewers in California. The gold was very fine, and it was impossible to save it through any of the processes then known. Amalgamation was the process applied to it. They occasionally used cyanide of potassium, but that was to purify and enliven the action of the "quick" and scour the plates. They put in a piece occasionally about the size of a hickory nut, but it did not appear to do much good, said witness, and it was abandoned. Witness had no knowledge that it was a solvent of gold at that time. Had he been aware of it he would not have used it, as he sees now that the gold they sought to save was dissolved and carried off down the creek.

"To what extent were you successful in the handling of this mine?" was asked by counsel of Mr. Steen.

"To the extent," said he reproachfully, "of losing $110,000."

Until some five years ago witness had never heard of the cyanide process for the extraction of gold, when he learned of the MacArthur-Forrest process.

J. E. Galligher was the next witness. He testified that he was well acquainted with the systems of extractiug gold and silver with the MacArthur-Forrest process in a general way. He had never had any practical experience in its application, but understood that the essential part of the process was the application of a weak solution of cyanide. He was not familiar enough with the process to say whether or not it was customary to pulverize the ore, but understood that it was being successfully done in the Mercur district. Mr. Galligher further testified that he had never heard of the use of cyanide in extracting gold from ores prior to the introduction of the MacArthur-Forrest process.

On cross-examination Mr. Galligher testified that he did not know whether or not alkali was used in the MacArthur-Forrest process, and did not know of his own knowledge what was the strength of the solution. He had only heard of it from others. Mr. Galligher testified that he was not an owner or stockholder in any of the MacArthur-Forrest companies, and was in no way connected with the patents or any of the owners.

The collection of evideuce since the present attack upon the patent was opened by James Hay has led to most voluminous results, the evidence for plaintiff alone filling a printed volume of 974 pages, while the cost of the issue to date is over $350,000, with expenditures continuing to pile up.

Mr. Sparks, one of the engineers for the MacArthur-Forrest Company, says that in May the South African gold mines had produced 74,000 ounces of gold through that medium alone; that it was successfully handling ores of a gross value of $1 per tou, aud that it was now in use in New Zealand and Australia in addition to America.

Mr. Thomas Goad, manager of the American Company, a licensee of the MacArthur-Forrest people, states that the Moffat mill alone at Florence was producing $10,000 a week, with a capacity of 100 tons daily, which was being increased to 500 tons, and that from all parts of the country came inquiries concerning the process and its applicability to ores accompanying the inquiries.

The defense of the Mercur management will be that it has in no wise been guilty of an infringement, in that the representatives of that process were unable to successfully apply it to the extraction of Mercur ores.

Value of a Ton of Ore.

How to Find the Gold and Silver Value of a Ton of Ore from Its Assay Button in Grain Weights.

TO THE EDITOR:—Fine scales with Grain weights to the one one-hundredth part of a grain, also to the tenth of one one-hundredth of a grain, are all that is requisite for the practical miner.

For this system of valuation, one ounce avoirdupois is used for the Assay Ton, although one-half ounce or any number of avoirdupois ounces can be used as hereinafter mentioned.

All ore must be in Avoirdupois, viz., 437½ grains to the ounce, 16 ounces to the pound, 32,000 ounces to the ton of 2000 pounds.

Gold and silver always to be weighed in Troy—12 ounces to the pound, 480 grains to the ounce.

One Grain is the unit of both weights.

Gold is $20.671824 per ounce and $0.0430663 per grain. One grain gold button from an assay ton of ore, 437½ grains, one ounce avoirdupois, is $1.378.12 for the ton of ore, 32,000 ounces and 32,000 grains of gold. One one-hundredth of one grain gold buttou from same assay ton is 13.78\frac{12}{100}$ for the ton. One-teuth of one one-hundredth of one grain gold button from same assay is 1.37\frac{812}{1000}$ for the ton.

To prepare to find the value in a ton proceed as follows:

After making the assay, weigh the button of gold and silver and make note of the total weight; place button in, say a half-inch test tube, and pour in about one-fourth inch deep pure nitric acid. Carefully wave it over a lighted alcohol lamp until the silver is dissolved; fill with water and pour off the liquid into salt water to save the silver some other time; dry and weigh the pure gold button into one-hundredths or tenths of one-hundredths grains; also make note of the weight of silver dissolved, so as to estimate its ton value, same as for the gold.

To prove the gold value of a ton of ore by its assayed gold button from 437½ grains of the ore, one ounce avoirdupois, take the value of 32,000 grains of gold, *i. e.*, one grain to each ounce of ore in a ton, viz., $1.378.12; multiply this amount by the one-hundredths grain weight of the button, and you have the exact value of the tou of ore; point off *two* figures of the answer on the right hand as fractions and the other figures as Dollars and Cents. If the weight of gold button is below one one-hundredth of a grain, multiply in same manner, but point off *three* figures on the right, and the others into Dollars and Cents. Thus:

$1,378.12
$\frac{10}{100}$ gr. button.
137.81\frac{20}{100}$ value ton ore.

$1,378.12
$\frac{150}{100}$ gr. button.
6890600
137812
$2,067.18$\frac{00}{100}$ value ton ore.

$1,378.12
$\frac{1}{10}$ of $\frac{1}{100}$ gr. button.
1.37\frac{812}{1000}$

$1,378.12
$\frac{9}{10}$ of $\frac{1}{100}$ gr. button.
12.40\frac{308}{1000}$

Calculate weight of silver dissolved in same manner at its market price—say at 67 cents an ounce; use $44.66 as the multiplicand; at 68 cents an ounce, use $45.33, and so on, adding or deducting 67 cents to this multiplicand for each one cent rise or fall of the market price. At 69 cents an ounce use $46.00, which is the value of a ton of ore with one grain of silver to each ounce of ore in ton—32,000 ounces; or 60 cents to the ton with one one-hundredth grain to the ounce, or 4$\frac{60}{100}$ cents to the ton for one-tenth of one one-hundredth grain.

If one-half an ounce of ore is preferred, 218¾ grains for the assay ton, then multiply the dollars and cents results by two, or if more than one ounce is assayed, then divide dollars and cents result by the number of ounces treated.

N. Y. "Daily Financial News."

Value of a Technical Education.

Fifty years ago the young man who, entering a life of activity, had "a good common school education" was fortunate. In those days the college was for the lawyer, the doctor, the minister. Then the young man could "learn a trade." To-day there are few trades to learn. The carpenter of to day is not the carpenter of fifty years ago, nor is the cabinet maker, nor the blacksmith, nor the shoemaker. Times have changed—wonderfully, radically changed. The little shops have almost passed out of existence, their usefuluess and necessity having been destroyed by the advent of the mammoth factories with equipments of ingenious mechanisms for producing the wares which hand labor so tediously and proudly turned out. The steam-actuated hammer has taken the place of that swung by the sturdy arm of the blacksmith, and the creaking bellows has given place to the little and more powerful fan. In every line of productive industry equally radical changes in methods and mechanisms have taken place. Production has increased, and labor has found a greater field for its exercise. The conditions under which the young man of to-day assumes the task of building his fortune demand a broader education and a different character of ability from those necessary when his father began his life-work.

To-day no one questions the high value of collegiate training, but is it an essential of business success in the productive arts? Must the young man without means to establish himself in business complete a college course before entering upon his life-work? Decidedly, no. The founding and endowment of polytechnic and technological schools prove this; but does the technological school entirely meet requirements? Again no would seem to be the proper answer, because, while a young man may "work his way through" and graduate with honor, opportunity for all young men, be they ever so ambitious and persevering, is not present. Look over the vast field of productive industrial pursuits to-day, and how many of the profitable, successful mechanisms and inventions can you count to which birth was given by the technically educated brain? Perfection and adaptation of the idea or crude mechanism may have been brought about by the man, or men, educated in the strength, ductility, malleability and durability of materials, who can calculate, almost to exactness, the direction and intensity of working strains; but the crude idea, the embryo, or the imperfect mechanism is, perhaps, more often than otherwise, the child of the uneducated brain. The arts and sciences are moving forward too rapidly, however, to justify waiting for the fruits of uncultured intellect to assist in the onward progress.

In our factories and mills and workshops, to-day, are young men with ambition, with skill and with a desire to advance. They read, perhaps, poorly, spell even more poorly, but in questions of shop practice they're entirely "at home." Talk with them; they have ideas; they cannot put them on paper, at least so as to make them understood, but they'll explain that if this and that could be done, in this or that way, such or such a result would follow. Ordinary early advantages have been, perhaps, per-

force, denied them. Ordinary advantages will not now avail them. How can they now, at a minimum of cost, and without loss of wage-earning time, make up, in special branches, the loss or lack of early education?

Coast Industrial Notes.

—At Grays Harbor, Wash., the sawmills pay $1.75 a day and the logging camps from $30 to $40 per month.

—The Oakland jute mills, employing nearly 500 people, are about to remove to Stockton, if prospective cheap fuel can be secured.

—Judge Ross of Los Angeles has declared the Wright Law invalid, a decision that will greatly retard the irrigation interests of the State.

—The Portland Iron Works, destroyed by fire last April, are being rebuilt. The brick structure is 85x100, first story; the second story 50x100.

What is believed to be the first electric sawmill on the Pacific Coast is being fitted up at Tacoma, Wash. A sixteen H. P. motor will be used.

The Pacific Refining and Roofing Co. is about to build an establishment on its Potrero site, 200x233 feet, to refine coal tar, manufacture building paper, etc.

—The Bicycle Railway Construction Co. has incorporated; capital stock $300,000, all subscribed. Directors—S. H. Bugbee, P. Selby and W. H. H. Hart of this city, E. Dexter of San Diego, and J. L. Wheat of Chicago.

—The Northwestern Lumber Manufacturers' Association have advanced the price of rough lumber to Eastern buyers $7 per thousand feet; first grade flooring to $18; drop siding to $14; bevel siding to $14.50, and finished cedar to $26 to $34.

—California will be well and suitably represented at the Atlanta, Ga., Exposition. A convention of county supervisors this week recommended that $12,500 be paid the State Board of Trade to send its collection of California products, and made preliminary provision for securing that sum.

—The horse meat canning establishment at Linnton, Oregon, the only one of the kind in the country, has began operations. The company buys range horses, packs and ships the meat, and expects to do a good business. A rate of one dollar per hundred on canned horse meat in car loads to the East has been secured.

—The Safe Deposit Building, corner Montgomery and California streets, this city, is being remodeled into a modern office structure. Electric elevators to cost $17,000 are being put in by the Union Iron Works. The Risdon Iron Works is putting in a $6000 engine and boiler. About $150,000 will be spent in reconstructing the building.

—Cargo lumber shipments from western Washington for June show an increase. Reports from nine of the leading mills received by the *Lumberman* aggregate 36,031,081 feet of lumber, exclusive of lath, shingles, pickets, etc. Of this, 19,824,842 feet went foreign and 16,206,239 feet coastwise. Unofficial reports of the shipments of the other mills make the total for the month 41,443,081 feet.

—Major W. H. Heuer has submitted to the chief engineer his report on the improvements of the San Joaquin, Sacramento and Feather rivers. On the San Joaquin river $20,985 has been expended during the year, making the total $341,246 for the improvement. On the Sacramento and Feather rivers the amount expended during the year was $33,426, making the total $611,741. The river is in good navigable condition.

—Several samples of lumber manufactured on the Pacific Coast have been sent to the navy department at Washington, where they will receive attention when the consideration of new gunboats is taken up by the authorities. The samples are furnished by Pacific Coast parties, who propose to put in bids on the building of the gunboats, and who want the authorities to see the kind of lumber that will be used in the vessels.

—The great Parrott building on Market street is magnificent in many details. The contract for building the electric plant has been let for $33,000, exclusive of fixtures and dynamos, covering simply the cost of the wires, insulations and connections for 4000 incandescent and 300 arc lamps. The insulated wires would be almost forty miles in linear length, this being believed to be the most extensive system ever contracted for in any single building in this country.

—The big tunnel of the San Joaquin and Stanislaus Water Company is finished. It is 1200 feet long, and every inch of it is through solid rock. It runs through a stone bluff, around which the company formerly had a hanging flume. Two shifts of men have been working on the tunnel night and day for many months. In some places the rock was so hard that but eight inches were made on a shift, and a blast would break out but a small portion of the rock. Work was carried on from both ends. The machinery and tracks will be taken out this week, and the water from the canal will be turned into it.

—The Vancouver, Klickitat & Yakima railroad has been sold at Vancouver, Wash., to C. N. Scott. By the terms of the sale, the purchasers paid about $5000 cash, and assumed indebtedness amounting to about $34,000. This indebtedness is to be paid in 15-year bonds, drawing 6 per cent; the purchasers also oblige themselves to build at least three miles of extension of the road this year. The sale puts an end to the litigation in the courts. The road is estimated to be worth from $75,000 to $100,000. The proposed extension will tap a valuable timber belt, and the road already has a contract to move 50,000,000 feet of logs.

—The total coal product of the State of Washington in 1894 was 1,106,470 short tons, having a spot value of $2,528,441. Coal mining in Washington received a sudden impetus in 1887 and 1888, practically reaching the limit of profitable production in the latter year, for in only two years since has the product of 1888 been exceeded. The product of 1887 was more than 75 per cent larger than in 1886, and that of 1888 more than 55 per cent larger than in 1887. The product in both 1890 and 1893 exceeded that of 1888 by about 50,000 tons, but these were the years when it did so, though in no year has the product fallen below 1,000,000 tons, since it passed that figure in 1888. In 1894 the product was 158,407 tons less than in 1893, while the value declined $342,435. There was an advance in the average price per ton from $2.31 in 1893 to $2.33 in 1894.

—B. F. Cheney, Jr., of Boston, chairman of the board of directors of the Santa Fe system, accompanied by C. S. Gleed, a director of the company, was here this week on a tour of observation, it is believed, for the purpose of finding out just what is needed in the way of branch lines hereabouts to complete the system. So far over $3,000,000 of railroad construction work is in sight, with almost $10,000,000 to be expended in the near future. The Southern Pacific has construction costing about $2,000,000 in view in the valleys tributary to Los Angeles, while the Santa Fe has undertaken extensions from San Jacinto, Temecula, and other points, which will necessitate an expenditure of about $1,000,000. The proposed Los Angeles and Salt Lake road would distribute $6,000,000, and the proposed San Diego and Phœnix road would cost $4,000,000.

—The next Mechanics Institute Exposition opens at the Pavilion in this city on the 13th prox. It will be different from many of the former ones, more varied and complete, and with special reference to the progress in actual manufacture of coast products. Superintendent Smyth reports that out of an available total of 80,000 square feet of space he already has applications for 76,000. This illustrates the interest felt by manufacturers and exhibitors, and justifies the zeal with which the officers and members of the association are working. Mr. Smyth says it is the wish of the management to consult the preference of exhibitors in the location of their exhibits as far as possible, and they will in all cases concede to an exhibitor the location which he deems the most appropriate to his exhibit, if such location can be made available. The available space portion of the main floor of the building will be occupied by manufacturing processes, which will receive their power from the same line of shafting. It is the present intention of the exhibit committee to occupy the annex hall adjoining the Pavilion with exhibits pertaining to the subject of roads and road making, forming an interesting department. Many of the exhibitors are making elaborate preparations in this department, besides the Merchants' Association, who will have a joint exhibit pertaining to the same subject, comprising individual exhibits by members of that organization. Manufacturing enterprises which have never before been brought to the notice of the public will be there seen in large variety and in actual operation. The fair will be an industrial success, and deserves the cordial co-operation of every one interested in the material progress of the city and State.

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

TRADE MARK.

(MACARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - £110,000 STERLING.

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

Mechanical Progress.

The Steam Gauge.

What is a steam gauge? An instrument for indicating the uumber of pounds there are in a steam boiler. But what is a pound of steam? Does it represent pounds in weight, or refer to some system of graduation?

If one weighs out a pound of cold water, and by applying heat, evaporates it into steam, it is simply changed into a pound of steam; but it is a pound tbe same as it was before. Wben we buy meat they take a "spring balance." This is called a spring balance, because if one takes a piece of meat that weighs ten pounds by it, and puts it on one end of say a piece of flat iron which is just evenly balanced over a knife-edged bearing at the center, and then puts ten pounds of iron on the other end, one would just balance the other, provided they were just the same distance from the center bearing. The steam gauge is simply a "spring balance" altbougb the springs in the two instruments are very different in their design and construction.

If one takes a tin box one inch square and a little less than twenty-eigbt inches high and fill it with water it weighs a pound. Lengthen out this box until it is 3722 feet long and apply a spirit lamp to the bottom of it until all the water was turned into steam, the box is full of steam, and still weighs one pound. With more water the height would be greater in proportion, assuming that all of the steam is of the same density. Attach a steam gauge to the bottom of tbe tin box when the water is about twenty-eight incbes bigh, it will indicatc one pound, and whcn it is turned into steam it will indicate the same. The steam gauge and tbe spring balance are the same; but owing to the nature of water, the pressure it exerts is measured by the height, regardless of the size of the column.

Supposing the box is strong enough to withstand pressure, and instead of leaving it opened at the top put in a slide which is tigbt when closed, and locate it at a height of 1938 feet: ucxt putting one pound of water in it, as before, which stands twenty-eight inches high, attach the steam gauge, light the lamp and evaporation begins. When all of the air bas been driven out close the slide and continue to apply heat until all tbe water is evaporated, when the steam gauge pointer will stand at fifteen pounds. We will now empty our box and then put one pound of water in it as before. This time we will locate our slide at a heigbt of 817 feet, and when all of the water is evaporated tbe gauge will indicate sixty pounds. By this we see tbat if the same amount of steam is crowded into a smaller place tbe pressure will be greater.

Let us repeat tbe last experiment, except tbat we will put in two pounds of water instead of one, and when it is all evaporated we sball have a good deal more than sixty pounds pressure. By this we see that if we crowd more steam into a given space, the pressure is increased. This is wbat we do when we get up steam in our boilers, for there is a certain space above the water tbat we have to fill with steam, and the more we crowd into it the greater will be the pressure.

When the pointer moves from any cause, there is some movement of the machinery within, and it naturally follows that the more this is moved the more it will wear; consequently if the gauge is connected to tbe steam pipe of an automatic engine, and every time the valves cut off the steam the pointer vibrates excessively, do not allow it to do so day after day, but close tbe valve in the pipe until tbe pointer barely moves, thus showing that tbe gauge gets the full pressure, and the instrument will last mucb longer.

To fully realize the advantages of steam jacketing in a compound engine, the jacket should be applied to tbe higb pressure and intermediate cylinders and two receivers. It is not advisable in either case, especially where a condenser is used, to apply the jacket to the low-pressure cylinder. The actual gain effected by the use of a steam jacket is "the difference between the saving by the prevention of condensation in the cylinder at the beginning of the stroke, and the loss by heating the exhaust steam during the return stroke." It is necessary to thoroughly consider tbe conditions that an efficient system of steam jacketing offers for tbat purpose, and it may be safely stated that, if properly applied to engines working expansively, a saving of from 5 to 7½ per cent of fuel may be effected. The scarcity of practical, reliable data is probably the cause of a variety of opinions regarding the advantages of the steam jacket. Without doubt it has been practically demonstrated that the steam jacket is a source of economy, and, furthermore, without efficient steam jacketing the highest economy is not attainable. Many engineers wbo are antagonistic to the application of the steam jacket probably pursue that course from having been in contact witb defectively constructed forms, and from wbich the results obtained have been unsatisfactory.

An Interesting Discussion.

The newly elected president of the American Institute of Electrical Engineers, Dr. Louis Duncan, at a recent meeting of that organization, discussed the situation of steam for electricity in railway practice.

Dr. Duncan first considered the proper policy for existing steam roads to adopt. He agrees with other experts in saying that freigbt is now more economically bandled in long, beavy trains than in any other way, and that sucb trains, like infrequent and heavy expresses, can best be handled by steam. When tbe power on a line is being absorbed by a very few (perhaps only one or two) large units, it does not pay at present to use electricity. But wben the "load," or sum of all the demands, is distributed by a great number of smaller units, as when frequent sbort trains are run, electric traction has tbe decided advantage. On four-track roads, then, he would put expresses on two tracks, and continue awhile to run them with steam. The other two tracks he would equip with an overbead wire, provide the local trains witb trolleys and motors, and conduct tbis branch of the service electrically. Tbe freight trains would use tbese tracks, but employ steam. On two-track roads, unless other cbanges are made, Dr. Duncan would not advise the introduction of electricity; but be declares that if sucb lines wish to remain on a dividend-paying basis, "it is imperative" that most of them "either build additional tracks or control the electric roads that parallel them." Many companies to whom tbis advice is tendered already realize, from the experience of the past year, what a formidable competitor tbe trolley has become. It is pointed out by way of illustration that on one single line—the New York Central in 1892—the through passengers numbered 234,650 and the local passengers 21,978,979 (between 93 and 94 times as many). Commutation rates reduce the profit on this class of busiuess, but its dimensions are so considerable as to emphasize the remark just quoted. Dr. Duncan adds: "In a few years electric roads will have absorbed practically all of tbe local traffic and will begin to cut into tbrough transportation. The steam roads cannot afford this. Their only safety is to make of electricity an ally instead of an enemy, and this before it is too late."

Most of the problems that are likely to arise in such transportation, President Duncan thinks, will be disposed of in building and operating tbe proposed line between Baltimore and Wasbington; and he therefore considers that enterprise a significant one. For municipal rapid transit with frequent service, whether on elevated or underground roads, of course the argument is strongly in favor of electricity. A preference for the direct current, instead of the alternating, is expressed in tbis connection; but the objection offered to the latter is not treated as very serious.

The precedent established by the Baltimore and Ohio road in equipping its cross-town line with a heavy motor is pronounced by the new president of the Electrical Engineers a good one, not only for the many other tunnels throughout the country, but also for switching in yards, especially when (as is often the case) the two spheres of usefulness are so close together topographically that the same motor can be used in both.

Scientific Progress.

Exploring the Upper Air.

Meteorologists believe tbat a great deal of useful information may be obtained by an intelligent and systematic exploration of the upper air. The great atmospheric currents which flow from the equator toward the poles, at a considerable altitude, otber movements which have mucb to do witb the progress and route, if not with tbe formation, of our storms, and various conditions of temperature and humidity aloft, on which our weather here below is more or less dependent, can be studied better by a proper series of aeronautic ventures than in any other way. Our mountain observatories possess the advantage of stability, and they permit regular and continuous records of wind direction and velocity and other pbenomena to be made. Valuable contributions to weather science have been made in tbe last few years in consequence of the establishment of such posts. But we want to learn something about regions which are still higber, and which are free from the wind-deflecting and temperature-modifying influences of irregular uplifts of the earth's crust.

Two or three years ago several small gas-bags, not accompauied by living passengers, but equipped with self-recording instruments, were sent up from tbe vicinity of Paris, and one of them, wbich was subsequently recovered, showed that it had attained a height of at least ten miles! The same thing bas beeu done in Germany, too. But it is highly desirable tbat such airsbips, like Cook's tourists, should be "personally accompanied." Observations made under such circumstances are more complete and instructive. When one ascends more than four or five miles, bowever, the air is so rare tbat it is almost impossible to breathe. Glaishes, wbo in 1862 got up at least 29,000 feet (nearly six miles), became unconscious at that point, as did his companion, Coxwell; and this has bcen regarded as about the limit bcyond wbicb one could not hope to go in safety, unless some improvement were made in tbe facilities for sucb work.

Last year tbis record was matched by a German aeronaut, Berson, who took along a cylinder of compressed oxygen, such as druggists in large cities keep for medical purposes, and breathed that gas wben the air had grown too rare for comfort. The lowest reading of bis barometer (9.1 incbes) indicates that his elevation was from 28,700 to 30,000 feet, and his achievements points out a way by which imitators (like Professor Hazen) may reasonably bope to retain full possession of their faculties six, seven or even ten miles up.

Among the results attained on this occasion were these: Dr. Berson recorded a temperature (almost directly over Berlin in summer) of fifty-four below zero, Fahrenheit, something never observed at the surface of the earth except in tbe interior of Nortb America and Asia or the Arctic regions in winter; he found that the rate of temperature decreases with ascent. After be got up a mile it was about one degree to every 250 feet, or more rapid tban bad been bitherto supposed. Below the one-mile limit the rate was slower, while at certain hours in the morning and evening there was a slight increase of temperature with ascent; a good deal of bumidity was discovered in certain strata six miles up; and the cirro-stratus clouds, beretofore believed to be composed, like the pure cirrus, of ice particles, proved to be made up of snowflakes. Eacb single ascent like this, effected by a competent meteorologist, adds perceptibly to our knowledge. But it is desirable that many more, in America as well as in Europe, planned with reference to locality, season and nearness of area of high and low barometric pressure, shall be undertaken in order to enable us to reach safe generalizations on various questions.

First Cunard Steamer.

The first Cunard line steamer, the Britannia, left the Mersey for the United States on July 2, 1840. The company started with four steamers each of 1200 tons gross register, built of wood, and propelled by paddle wheels. Boston was then the great harbor of the States, and the Britannia made ber first voyage in 14 days 8 hours.

Her arrival at Boston was the occasion of great public rejoicing. Salutes of artillery were fired and other festivities werc held to celebrate the important event. A weekly service was maintained for seven years, two more steamers of 1400 tons being built. After this tbe Englisb Govcrnment called on tbe company to double the number of sailings and six new vessels were built. Some little time afterward the paddle steamer Arabia was built. She was a vessel of 2400 tons, and was considered at the time to be the largest it would be safe to build for Atlantic navigation.

In 1852 a radical change was iutroduced, tbe sbips being built of iron, and the paddle wheel being superseded by the screw propeller. This was found to be so satisfactory that only two more paddle steamers were built, and then the screw was adopted in all cases. The immense advance of engineering and shipbuilding since that time is well sbown by the size and speed of the vessels now belonging to the company.

The following is given in brief as the theory most generally entertained by scientists, with a few exceptions, concerning tides: It is assumed that tbe moon, acting alone, would not only raise a wave on the side of the earth nearest to it by gravitation, but would also draw the eartb itself far enough out of its course to leave behind some of the water on tbe farther side, which water would then be raised relatively to the earth's surface, and constitute the second tidal wave. The sun alone would act similarly, altbough its tide-raising effect is only about two-fifths that of the moon. Now, at new moon, the sun and moon "pull together" and give higher tides than at the first and third quarters, when the sun draws its right angles to the line of tbe moon's attraction, and at full moon, when the sun is on tbe opposite side of the earth from the moon, virtually the same effect is observed as at new moon, but the double tide-raising action of the sun would again be superimposed on that of tbe moon and give tides on opposite sides as bigh as those a fortnight before.

Owing to the occasional damage done to the fishermen's nets by what appeared to be fragments of masonry in the sea off the Italian peninsula of Istria, the city authorities of Robingo sent down a diver tbe other day to investigate. At a depth of ninety feet he found himself in a submerged city, with streets and squares laid out, the doors and windows of the half-ruined bouses being almost hidden by masses of seaweed. Archæologists identify this lost city witb the island and city of Cissa, described by Pliny, and of which no trace had been found since tbe days of tbe Cæsars.

Bulletin No. 10 is received from the Department of Geology of the University of California, descriptive of Lawsonite, a new rock-forming material from tbe Tiburon peninsula, Marin Co., Cal., by F. L. Ransome.

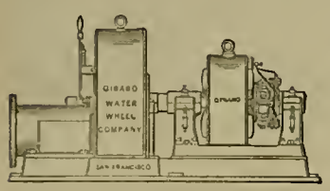
The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.



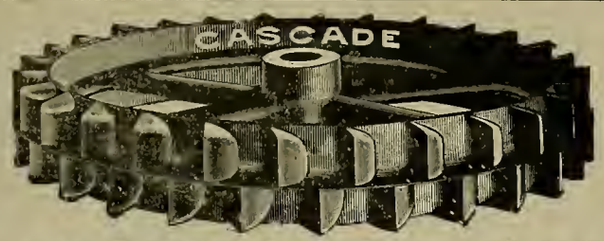
PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,

121 MAIN STREET, SAN FRANCISCO, CAL.

American Girard Water Wheel.



Adaptable to all heads between 30 feet and 2000 feet, particularly where economy in the use of water and fine regulation are desired, as, for instance, the operation of electric dynamos.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4¾ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving track shows LESS; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with LESS than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,

CLEVELAND IRON ORE PAINT CO.

THE AM. BALL PULVERIZER. Morris Patent.

DEWEY & CO., 220 Market St., SAN FRANCISCO,

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Mining Summary.

CALIFORNIA.

Butte.

AROUND HAZLETON.—At the Mattie quartz mine the shaft is to be sunk 50 feet deeper. The ledge is 24 inches wide and runs $8 in free gold. The Frederick mine has been bonded by Bothwell & Co., who are developing it. The Phœnix mill is in operation.

THE GOLDEN BUTTERFLY.—Col. McLaugblin is now adopting a new plan in working the Golden Butterfly, and is driving a tunnel 5½ by 6 feet through the bedrock, with the idea of raising into the gravel when beyond the break that has bothered the pipes and kept them playing on top dirt. It is the opinion of many in that locality that valuable gravel underlies Table mountain; this tunnel will confirm or disprove the belief.

THE MAALIA RIDGE.—The Princess Mining Company bave reacbed bedrock, after running an incline over 300 feet.

The Wylie Bros. are running a new tunnel from a lower point. Coates and Miller will flume tbe river from about two miles above.

THE BLUE LEAD BONDED.—The Gridley Mining Company have bonded their mine at Bangor to men from this city, who will work the property this summer.

THE CATSKILL MINE.—The *Register* says the miners who leased the Catskill mine made $3.50 a day on the first clean up and expect to make $5 a day on the next clean up.

Calaveras.

FREE GOLD.—Ore containing free gold is now being taken from the Gottschalk mine. Eleven men are at work.

PURE QUILL MINE.—*Voice:* This mine, is an extension of the Blair mine. The shaft is a vertical one, and is down 75 feet. In crosscutting at the 50 foot level a well developed 1 6-foot ledge of ore was discovered, and the rock which is now being taken out averages $800. The footwall, composed of heavy block slate, is full of mineral.

El Dorado.

RENEWED ACTIVITY. — *Republican:* More gravel mining is being done in the vicinity of Placerville now than for several years past. The Unity Mining Company are breasting and boisting gravel at Dirty Flat which will be washed through a flume as soon as enough accumulates on the dump. Hitberto the gravel has been worked by mill process but Superintendent Kimble finds that the beds now being explored will slack on exposure to the air sufficiently to work by a simple process. On the opposite side of the lava ridge, the Lone Star or Rupeley mine, is breasting gravel, taking it to their mill through a tunnel about twelve hundred feet long. About twenty men are employed. Tbe mill recently purchased from the Unity Company has been erected and is running on gravel from the mine. At tbe Tockey mine, where the new mill was recently erected, work is being vigorously prosecuted through the tunnel hy which the gravel is reached. As soon as the contest over the Potts or Granite mine is settled by the lawsuit now progressing in the Superior Court, it is probable that work will be resumed on tbat property by one or the other of the contestants.

Mariposa.

A GOOD SHOWING.—*Gazette:* We have made a hurried list of tbe number of stamps either now in operation or heing got in readiness for work. While we may have omitted some of the mines, as the mining area is large and we write only from memory, yet the ones mentioned are exact. There are a number of the mines mentioned which are in process of construction, but the wbole number of stamps given will be pounding gold from our unlimited supply of rich ore before the close of the year. The list is given as follows:

Mine and Location.	*No. Stamps.*
Cal. Mines Co., Red Banks	60
Merced G. M. Co., Coulterville	40
Sierra Butte Co., Whitelock mine	40
Hite G. M. Co., Hite's Cove	40
No. 9, Hornitos	30
A. Revel, Sweetwater	10
Santa Rosa, Colorado Dist	10
Buena Vista, Saxon Creek	10
Burt & Bach, Bear Valley	10
Barcroft, Hornitos	10
Tyro, Coulterville	10
Red Cloud, Coulterville	10
Compromise, near Coulterville	10
Bondurant, Coulterville Dist	10
Banderita, Coulterville Dist	10
Golden Virgin, Coulterville Dist	10
Sunset, Snow Creek	10
Eureka, Hornitos	10
Francis, Hornitos	5
Wiswell, Hornitos	5
Ludwig, Mariposa	5
Malone, Bear Creek	5
Branson, Cotton Creek	5
Ellingham, Whitlocks	5
Huntington, Colorado, rotary, equal	5
Breen, Mariposa	2
Perch & Bonham, Plum Bar	2
Total	379

In addition to the above, a chlorination plant has just been completed at the Quartz Mountain mine, near Hornitos, but of what capacity we are not informed.

We credit the Merced Gold Mining company with forty stamps, the number with which the mill will start, but as soon as practicable this number will be increased to 200 or 300.

At the Whitlock mine, also, the mill now nearly completed, is designed for a much larger number of stamps than the forty which will be used at the start.

The No. 9 mine, near Hornitos, is likely to be sold soon to an English company and will be worked to its full capacity.

Every day new enterprises are being started, and it is not improbable that by the beginning of 1896 there will be 500 stamps in operation in this county.

Nevada.

PROGRESSING.—*Transcript:* The building for the new twenty-stamp mill at the Mayflower mine, Canada Hill, is about completed, and the foundation for the hoisting works is now being laid. All the machinery is on the ground and it is thought tbat everything connected with tbe new plant will be ready for operation by September. Thirty men are working in the mine, but are doing development work principally, taking out only such quartz as is in tbe way. The object of this is to open up the mine so that a large force can be put to work and more extensive operations carried on.

WILL WORK THE COMET.—*Union:* A strong company has been formed to work the Comet mine. In early days this property paid well. There is a shaft 200 feet deep and a tunnel taps tbe ledge.

PUTTING UP MILLS.—*Transcript:* Everything is life and activity at the Spanish mine, above Washington. Men are busy erecting a ten-stamp mill and putting up four Huntington mills. As soon as the machinery is all in place tbe mine will be started up, as everything is ready to hegin stoping. This mine is owned by Fred Bradley, formerly of this city, wbo is at present superintending a big mine in Wardner, Idaho.

Placer.

ON THE DIVIDE.—There are more prospectors on the Forest Hill divide than before in years. Tbe Hidden Treasure tunnel has been worked 9000 feet, but now operations are heing carried on at a distance of 3000 feet, where 150 men are employed. It is a low-grade mine, but the output is $15,000 a month. Operations have just been begun on the Mountain Gate mine, to the north of the Hidden Treasure, and the owners of the latter have purchased tbe Dam tunnel in order to open the ground on the south end of Mountain Gate.

Plumas.

DEVELOPMENT WORK.—A. U. Rugg, general manager of the Gold Bar Consolidated Mining Co., will do considerable development work on the middle fork of the Feather river this summer. Samuel J. Hendy, of the Joshua Hendy Machine Works, J. W. Patterson, J. H. Page, A. D. Moore and others are interested in this project, wbich comprises the working of seven gravel bars, stretching along the river five miles. A sawmill will be put up, a wagon road made, and the requisite machinery put in. It is calculated the enterprise will give employment to several hundred men.

San Diego.

THE GOLDEN CROSS PROPERTY.—Hedges, the site of tbe mines and mills of the Golden Cross Mining and Milling Company, is near Ogilby, on the S. P., 16 miles from Yuma. The company about two years ago bought thirteen claims and took up fourteen more, built a 40-stamp mill, with an engine of 120 horse-power, and began devcloping the low-grade gold ore property. The Queen mine has an inclined sbaft of 40 feet, with four working levels. The Golden Cross has a vertical shaft of 125 feet and an inclined sbaft of 180 feet. The Golden Crown has a shaft of 250 feet. The Talmage has a 50-foot vertical shaft, with a tunnel running into it of 260 feet. The Beecher has two tunnels, 80 and 60 feet respectively, the Ingersoll a tunnel 55 feet in length, extending through the mountains. The company is building a new 100-stamp mill, which will be in operation next month, with a Corliss engine of 300 horse-power, a surface condenser and air compressors for running power drills, and all modern auxiliaries, including an electric light plant. A six-inch pipe line is being extended to the Colorado river, twelve miles away, and 350,000 gallons of water will be pumped every twenty-four hours. The assays show all the way from $4 and $5 up. The bullion is shipped to this city. It is free milling ore.

Shasta.

ON CLEAR CREEK.—A. H. Fitch bas leased his stamp mill on Clear creek to G. W. McFarland and T. H. Pendleton, who are running the mill on ore from the Oro Fino mine. The ore mills about $10 in free gold, and the sulphurets are bigb grade. He has let a tunnel contract to W. H. Emmerson and James Johnson to cut the main vein of the Oro Fino, inside of 100 feet. Drifting on the vein will theu begin.

MIDDLE CREEK DISTRICT. — Diestlehorst Bros.' new dredge, now being built, will soon be ready for operation on the river bed near Middle Creek. Tbey are the first to have succeeded in a venture of this kind in the State.

THE DOG CREEK ANCIENT CHANNEL DRIFT GRAVEL MINE.—This property has been examined hy T. B. Smith, G. S. Deming, C. E. Brown and others, who consider it a property tbat can be cheaply developed. Tbe system consists of a lava-capped ancient channel overlying solidified slates. It has made three spills or deposits, viz.: Into Cbase gulch, which deposited into Dog creek; into McCall gulch, which also deposited into the same creek, and the third spill heing into the same creek at a point where the channel and Old Dog creek come together. At this point the channel leaves the creek and for one mile has not yielded a particle of its gold. At its outlet the Point just above the Sacramento river and Dog Creek it made its final deposit, which was very rich. The channel is easily traced from its head to the outlet, and is very easy of access. When one takes into consideration the small extent of channel which threw off so many miles of rich bars, beds and banks of the Old Dog creek, it is permissahle to assume that the lava-capped channel is rich. Every channel of a like character in our State has yielded well.

WORKING THE PROPERTY.—*Democrat:* There are hundreds of good ledges that show enormous croppings that have been passed by for years and considered valueless because they did not show free gold. Now the prospector is finding out that many of these ledges are of the richest; and there are also a great many blind ledges—that is, ledges that do not show any croppings on the surface. These blind ledges are frequently very rich and are true fissures.

R. G. Hart of the Texas Consolidated is putting in new boilers and will increase the number of stamps. In fact, bis intentions are to double the capacity of bis already large plant and add several large roasting furnaces.

C. Lane, who took a working hond on the Brunswick a short time ago, is working the property. This is one of the oldest quartz mines in Sbasta county.

The Washington people are making extensive improvements on their property.

The Shasta County Development and Mining Company are working their mines, the Alta group, in Flat Creek district, and will soon erect new machinery for development work. Several parties who have large ledges on wbich they have expended from one to two thousand dollars are anxious to have tbis company take bold of their properties and complete the work of development. This is the proper course to pursue. Tbe day for selling prospects and holes in the ground is passed, but developed mines are in demand and can be sold at a fair price.

Sierra.

THE SCOTIA MINE—At the Scotia mine, situated one and a half miles southwest of Alleghany, Smith & Craft are making a good sbowing after three years of hard development work. The vein runs from one to four feet, carryiug sulphurets and free gold. Tbe owners are contemplating the erection of a mill, water power being conveniently at the door.

Siskiyou.

PUMPS STARTED.—The mammotb pumps of the Espey, Hunter & Co. mines at Hawkinsville were started last Wednesday and worked very well, except that there was some leakage, to he remedied by packing, as anticipated. On next day the pump, baving been tightened, worked fine, raising a large body of water to the flume at tbe top of the hill, extending to the diggings, the height being nearly 500 feet, through iron pipe laid up the side hill, a distance of about 1100 feet horizontally.

Trinity.

Platinum is reported to bave been found in quartz near the bead of Packers' Gulch. Platinum in quartz bas frequently been reported in the northern part of the State, but on investigation it has almost invariably proven to be galena sulphurets; in fact, it has never yet been found in quartz in the United States, so tbat the above statement sbould be taken with considerable allowance, but galena sulphurets are a pretty good indication of gold-bearing quartz. The gold of Packers' Gulch is quartz gold and has not traveled far.

RICH QUARTZ ON LADY SLIPPER. — *Record:* At the Himes claim on Lady Slipper, between the North Fork of Coffee Creek and the Nash mill, they have recently struck a ledge 12 inches wide in a formation of serpentine and porpbyry, which, according to Selby, of San Francisco, goes $100 in free gold and $4.60 in silver. The gold is returned at $20 per ounce. If this proves to be the case, there is but one otber mine in California which can beat it for purity. The San Guiseppi, just outside of the town of Sonora, Tuolumne county, where it sometimes goes as high as $20.50 per ounce, pure gold, 1000 fiue, is worth $20.67 the world over. The Himes mine on Lady Slipper was prospected last year by Messrs. McLeod and Henderson, who on leaving, posted a notice that they had abandoned the claims, and that anyone who wished to locate tbem could do so, a permission which was takeu advantage of by the parties who made the recent discovery within a few feet of where McLeod and Henderson quit work. It is not very often that prospectors are so considerate to those who come after them, and the gentlemen named are to be commended for their forethought and consideration for others.

Tuolumne.

GENERAL NOTES.—*Democrat:* A $50,000 plant is about to be erected on the App mine at Quartz Mountain.

The Darrow Bros.' mine, situated one-half mile east of the Alameda, at Rawbide, and bonded to John Witney, is in bonanza. The strike was made this week, hut the extent is not fully known. It is said rock is heing taken out that yields $15 to the pound.

At the Dead Horse mine at Summerville a rich body of ore bas been discovered in the 1400 level.

ON INDIAN CREEK.—Doyle and Gould have a mine situated on Indian creek which has a free gold vein, samples of ore selected at random assaying well.

THE SHANGHAI QUARTZ.—W. A. Nevils and others have taken hold of the Shanghai quartz mine, a short distance above Columhia.

Yuba.

INACTIVE.—Mining matters at Smartsville are still in a lethargic condition. The Excelsior Company's mine is still inactive, but the company is expecting to be able to commence operations soon again. The Camphell mine is working about forty men.

NEVADA.

STOREY COUNTY.

THE BRUNSWICK PROSPECT.—In case of the prospecting operations now in progress on the Brunswick lode developing bodies of paying ore, writes Dan De Quille, in the Salt Lake *Tribune*, some of the other schemes now heing talked of will doubtless be pushed. Of these those that at present find most favor are the two drain and exploration drifts from the Sutro tunnel level of the Alta shaft, one to be run west to American Flat and the other south into Devil's Gate district. These drifts would eventually he about 6000 feet in length as planned at present, hut as both start in a favorahle formation and will constantly he advanced in a fertile formation within the Comstock mineral helt, they are liable at any time to cut into ore deposits of value. Almost at the start discoveries of importance may be looked for, and the two drifts through their whole course will be in ground liahle to contain ore veins. Something may be expected at ouce, therefore interest in the work will be kept alive from first to last.

At American Flat the formation is much the same as along the lode in Virginia City and Gold Hill. The Comstock lode has been developed and paying ore extracted almost continuously from Cedar Hill, just north of Virginia City, southward through Gold Hill to American Flat, a distance of about 20,000 feet. At the Flat progress southward as regards paying operations ceased. At tbat point a wide depressed area produced conditions unfavorable to further development. Tbe ground at this poiut is so situated that to tap and drain it to any profitable depth would require an immensely long tunnel, and the attempt to work it by means of shafts proved a failure, owing to the great amount of water encountered at a depth of from 300 to 400 feet. The most powerful pumps proved unequal to the task of bandling the great floods of water encountered. One company after another gave up the costly struggle, and finally American Flat was deserted.

It seems almost certain that a large hranch of the Comstock leads into and perbaps through the Flat into tbe hilly region lying to the southward, but at that great wet basin the work of exploration ceased, and for many years all that section has been deserted.

The proposed drain drift from the south hranch of the Sutro tunnel would make it possible to prospect and work the American Flat mines, and probably to trace the lode beyond that point. The Baltimore, Knickerbocker, American Flat and other mines on which work was done in the early days gave good prospects. A considerable amount of ore that paid $90 a ton was taken from tbe Baltimore, and also from the American Flat mine, au adjoining claim. The Rock Island was also once a claim of great promise, but it was drowned out at a certain depth, like half a score of its neighbors. Some portions of the upper sections of a few of thc old American Flat mines might perhaps now be profitably worked for gold. The croppings of the Baltimore yield no other metal, tbough at depth silver was found. The Rock Island is a vein of white quartz about 100 feet in width, heavily charged with iron pyrites, which would probably prove rich enough in gold to pay for concentration.

The Comstock lode consists of a system of fissures, in which are found quartz and more or less rich deposits of the precious metals. Very few of these fissures show on the surface, and many do not reach the surface by hundreds of feet. This being the case, no one knows where fissures of paying ore will be found; all that can be done is to run exploring drifts and trust to luck. As the drain drift to American Flat will be iu fertile ground from start to finish, it will be liable at any time to cut into paying ore.

OCCIDENTAL PROSPECTS.—*Enterprise:* The connection between tbe drifts on the 550 level of the Occidental mine and the winze sunk from the 550 level has been made, and now vigorous work on the prospect in that miue will be in order. This connection was important, as through it the air used in the work of prospecting these levels is largely drawn. The importance of this connection is uot generally understood by the stock-dealing puhlic, but the fact is it opens to active work the most favorable looking prospect to-day on the Comstock or in its immediate vicinity, so far as made public. The ore in this prospect was first encountered in a drift run farther west in the Occidental ground than any had ever been before. This drift cut a stringer of ore about eighteen inches wide.

A winze was then sunk to connect with the 550 level, and at the same time an old drift, run originally by James G. Fair when he was superintendent, was taken up and extended west to connect with the winze from the 500. It is this connection which bas just been made.

THE BRUNSWICK LODE.—*Enterprise:* Tbe question of taking water to the Brunswick lode, it is understood, is far from being settled. Whether it is most advisable to take water power to the lode by the way of a pressure tank, proposed to be built 700 feet southeast of the Combination shaft, or whether to take it direct from the Gold Hill tank, or whether to take to the Brunswick lode only such water as would be necessary to supply steam power at the hoisting works are the problems involved. It is understood that nearly everbody interested is in favor of taking water power out to the lode, as this water power, after having run the works at the lode, can be taken down incline No. 1 and thence to the Sutro tunnel level, where tbis waste water would again gain a head of 1340 feet—sufficient to carry on extensive mining and milling operations.

The question of getting water out to the lode is one upon which the success of the whole Brunswick lode enterprise may hinge, and its outcome is therefore watched with much interest.

THE SAVAGE MINE.—During the past fiscal year the Savage mine yielded 3758 tons of ore, of which 3187½ tons were milled at the Nevada mill and 781 tons at the Brunswick mill, the bullion yield of same heing as follows: Gold $15,755.20, silver $43,426.55; total, $59,-181.75; discount, $23,806.16; net cash received, $35,375.59.

WHITE PINE COUNTY.

THE JOANNA MINE.—A strike is reported in the Joanna mine. A drift has heen run 18 feet across the vein at the hottom of the shaft and how much farther they will have to run to get through the vein is not yet known. The ore is free and assays $50 per ton in gold. A ledge 18 feet wide and assaying $50 per ton in gold sounds very hig.

LINCOLN COUNTY.

STRIKE IN THE GAVELIN.—*De Lamar Lode:* In the progress of the present work on the

Gavelin property free gold was discovered on Friday. This is a most important development, as it goes to establish the existence of gold outside of the theoretical north and south ledges and ore bodies. The Gavelin ledge is located east and west and across the lower end of town.

OREGON.

AROUND BAKER CITY.—*Democrat:* The Red Boy mine at Granite is said to be netting $4000 a month.

The old pioneer producer, the Virtue, continues to make great strides.

A party of placer miners are operating on the Middle Fork, a short distance from Leadville, and they are said to be taking out $5 per day to the man. They have about six acres of ground.

The Robbins-Elkhorn is producing some good ore these days.

The Humboldt Mining Company, operating the large placer mine near Canyon City, will be forced to suspend operations soon, the water supply is failing at such a rapid rate.

It is said that the placer miners in the Granite district will not lay aside the pick and shovel until snow comes.

AT THE ASHLAND MINE.—Eight men, under Thos. James as superintendent, have begun work at the Ashland mine. The work will be prosecuted on the west side, where some of the richest rock yet milled from the mine has been opened up. The development there has filled with water since work stopped, and the first thing to do will be pumping out. Only a day force will be employed at present and a week or two will be required before a steady output of ore can be expected.

BAKER COUNTY.

THE BONANZA MINE.—The Bonanza mine has already produced more than $200,000 from the old workings and never looked better than at present. The country rocks are a series of slates, quartzites, limestones and serpentine. The vein occurs in black slate. It is very regular, and is opened for 1200 feet in length by two tunnels, respectively 125 and 250 feet deep. Two working shafts are started and are now each down 20 feet farther. There are three ore chutes aggregating 600 feet in length, and this is being daily increased as the lower tunnel is being driven ahead on from 8 to 10 feet of ore, which goes to the mill as extracted without sorting. The vein as stoped and milled has varied from 1 to 12 feet in width; it will probably average 4 or 5 feet throughout the mine. The ten-stamp mill is kept running constantly.

IDAHO.

THE BLACKFOOT DISTRICT.—While it is to quartz that Blackfoot looks for its future, the old placers are still being worked and some new discoveries are being made, 50 men having worked there this spring as long as water lasted, most of them with satisfactory results. Except in a few instances the water is too low to work in any way but a rocker, and little ground will pay with so slow a method. A little sluicing is still being done, but the two hydraulics on Jerome creek, four on Gold creek and one on Garden gulch have all been shut down for some time. Some of the quartz men own placers which they work for a living, putting in what time they can spare in developing their ledges.

A NEW EXCITEMENT.—Bonner's Ferry is almost depopulated, owing to excitement over an alleged gold discovery on Crawford creek, a tributary to the Yahk, about 20 miles northeast. Already a townsite has been staked off and christened Lemleyberg, after Lemley and Berg, the original discoverers. About 35 claims have so far been located. The ledge has been traced for over a mile and a half, and is from 8 to 20 feet wide, and assays have been obtained running as high as desired a ton.

AT WALLACE.—Messrs. Finch and Camphell have secured a bond on the Custer mine, situated on the east fork of Nine Mile creek, about six miles northeast of Wallace. They have put to work twelve miners, who will make room for a larger force in about two weeks. The Custer has been idle for over two years, though formerly it was one of the principal ore shippers, and it is hoped it will again resume its old rank as a large producer.

The Hunter Mining Company at Mullan is expected to start up before long.

The foreman of the Poorman mine has wired to Butte, Mont., for twenty machine men. A few good union miners can find work at Butte at union wages.

MONTANA.

THE OLD APEX QUESTION.—A Butte dispatch says: In the $400,000 damage suit of the Butte & Boston Mining Company against the Lexington Company for ores extracted from the Wapello, the attorney for the defendant has filed an answer from which it appears that when the case comes to trial the same old question of apex rights will be discussed in all its bearings. The defendant's answer admits taking ore from the Wapello, but claims the right to do so for the reason that the Lexington has been the owner of the apex of the vein for more than ten years. The Lexington people deny, however, that the value of the ore taken from the Wapello was greater than $2,343.62.

NEW MEXICO.

A NEW SMELTER.—A smelter organization has filed articles under the name of the New Mexico Mining, Smelting and Refining Company, with principal office at Cerrillos. Capital stock, $1,000,000. It is hoped to break ground by August 1st.

BODY OF ORE AT GOLDEN.—At Golden, Santa Fe county, in shaft No. 1 on the Pearl R. mine, a body of ore the full size of the shaft has been struck at the depth of fifty-four feet. It appears to be a great fissure vein. They have only found one wall, and the width of the lead as yet cannot be determined. The ore averaged $40 per ton in gold. So far as actually developed there is a square 200x150 feet, overlaid with a body of ore at least twelve feet thick, or, in round numbers, fully 15,000 tons virtually in sight, 200 tons of which is now at the mill and on the dump. Test runs of ore from different places gave returns of from $5 to $30 per ton in gold, and one mill run of eleven tons gave a result of $40 per ton in gold. In sinking shaft No. 2 to cut the ore body 100 feet above the first tunnel, the top of the ore vein was struck at a depth of ten feet, and a sample assay made from a piece of ore weighing at least 100 pounds resulted in yielding $211 per ton in gold. It is claimed this ore can be mined, hauled and milled at the maximum cost of $3 per ton.

COLORADO.

AROUND TELLURIDE.—There was a time when the ores from the Telluride district were carried on burros across the high range to Ouray, loaded into wagons and hauled 200 miles to the nearest railroad. Then only bonanza mines could operate. To-day many changes have come which greatly cheapen the cost of operation.

Mines located high amid the snowy peaks are worked by power supplied through small wires which run over ridges, leap chasms and scale dizzy precipices. Some mines a dozen miles away from the generating station thus secure a steady, uninterrupted power.

Another recent successful improvement which still further reduces the cost of mining is the endless wire tramway which supports buckets of a capacity of 500 pounds burden. The Smuggler-Union Company operates such a tramway from its tunnel in the Marshall basin down to the railroad, a distance of 6,000 feet. The buckets clutch the cable and by their own weight push the cable along as they descend from an altitude 2,000 feet above the town. The returning buckets carry to the mines the bulk of the supplies needed in development work. This does away largely with the burro trains. The tramway at the Smuggler-Union has a capacity of 500 tons of ore per day.

The third improvement to solve the problem of profitable mining is that of the concentrating mills, wherein the values of the ores are taken out and the invaluable parts washed away. Seven tons of ore are at the Smuggler-Union reduced to one containing all the values of the seven.

To set up dynamos, tramways and concentrating mills requires an outlay of money, however, and though mining in Telluride has been made extremely profitable by these improvements, the cost of establishment is great.

One of the big mines in Colorado is the Smuggler-Union combination. It controls the entire length of the greatest gold-bearing vein of the district, and includes the Mendota, Sheridan, Smuggler, Union, Seventy-six and Hermit mines—properties which in their history have produced over ten millions of silver and gold. Besides this great vein, with its many developed areas, a parallel vein which crosses the Smuggler vein is also controlled by the Smuggler-Union Company. This includes the Pennsylvania, Emerald, Revenue and Ansborough claims, none of which have been very extensively developed. An expert informed the writer that it is a safe estimate to say that the ore blocked out contains at the present price for silver, fully twenty million dollars in values.

On the Smuggler-Union property between 28 and 29 miles of tunnels, cross-cuts, shafts and drifts have been made. One cross-cut tunnel 3,500 feet long opens both veins for a depth of 1,250 feet below the surface; another tunnel 2,500 feet long increases the development 200 feet deeper on the vein. There are four shafts, 1,000, 700, 500 and 250 feet respectively, and between these the drifts connect at various stages, and all upon the vein which varies in width from three to five feet.

ARIZONA.

THE PLANET MINE.—A correspondent of the Phœnix *Herald* says: "The lucky owners of the Planet mine, situated in Fool's gulch, between the Congress and Yarnell mines, have struck it rich, 900 feet east of their main working shaft, at a point where the ledge cropped. But little oxidized iron ore had been found and stripped along the surface for about 80 feet. The ore is about two feet solid in place, and gold can be seen all through it. Samples along the ledge run from $175.50 to $1,120 per ton. It is the top of a new ore chute, and its extent has not been determined yet. The owners, Holtzschue, Clark & Co., are jubilant. It is a chlorider's paradise and a prospector's delight.

THE HARQUA HALA.—*Republican:* M. Gallardo reports an extensive as well as rich body of ore being struck in the Harqua Hala. Since the strike, the company is keeping a close guard over the property, and no one but employes are allowed around the dump. It is thought that the strike places the Harqua Hala mine on a good footing again.

BRITISH COLUMBIA.

NEAR CHRISTINA LAKE.—About 100 men are prospecting in the neighborhood of Christina lake, and in the search for quartz ledges are gradually working in a westerly direction towards Boundary creek.

The Blaisdell Concentrating Co. direct attention to their improved belt made in the most thorough manner of superior material after new and improved patterns and warranted to give miners general satisfaction. *

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1906 Stockton St., San Francisco.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.
Crocker Building, Rooms 201, 202 and 203, San Francisco.

The Evans Assay Office.

W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering.

Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.

Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

EDWARD S. COBB,

Mechanical Engineer and Expert.
Tests and Estimates for the improvement of Pumping, Power and Hydraulic Plants.
Will supervise the Construction, Shipment or Erection of Machinery. Will make Drawings, Estimates or Specifications.
Prices obtained for machinery of every description. Twenty year's experience.
109 California St., Rms 30 & 31, S. F., Cal.

GILES OTIS PEARCE,

Mineralogist and Metallurgist.
708 Colorado Avenue, Colorado City, Colo.
Will examine Mines, Ore Bodies, Mineral Belts or Zones, and make written Mineralist Reports, fees for which made known upon application for services. I make my own assays and select my own samples when examing mines. Eighteen years' experience. Analysis of water and soils.

LOUIS FALKENAU,
STATE ASSAY OFFICE,

434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expertng in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

Almarin B. Paul, M. E.,
Mining Operator,

ROOM 58, CROCKER BUILDING,
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the investment of CAPITAL in RELIABLE Mining Enterprises, also will give attention to the sale of, and reporting on RELIABLE Mining Properties, or the procuring of suitable Machinery for Interest in Developed Mines.

Nevada Metallurgical Works,

No. 23 Stevenson Street,
Near First and Market Sts., San Francisco.
C. A. LUCKHARDT, Manager.
Established 1869.
ORES WORKED BY ANY PROCESS.
Ores Sampled.
ASSAYING IN ALL ITS BRANCHES.
Assays of Ores, Minerals, Waters, Etc.
WORKING TESTS (PRACTICAL) MADE.
PLANS AND SPECIFICATIONS furnished for the most suitable process for working ores.
SPECIAL ATTENTION paid to examinations of mines; plans and reports furnished.
C. A. Luckhardt & Co.,
(Formerly Huhn & Luckhardt),
Mining Engineers and Metallurgists.

Everette's Mining Office.

(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.

Electrical Progress.

The B. and O. Experiment.

The Baltimore and Ohio Railroad Company's use of electricity for hauling its heavy express and freight trains through a part of the city of Baltimore, over a new route opened for time-saving purposes attracts universal attention. One of the three 96-ton, 1,400 horse-power electric engines built for this service has been tested on the tracks on which it is to operate. This enormous machine stands 14½ feet high, and embodies a number of improvements in electrical mechanism. One of them relates to the method of communicating to the driving wheels the rotary motion developed by the armature of each of four motors. In ordinary street cars this portion of the motor is built around the axle and carries the latter with it, or else gears into the axle. But in the huge Baltimore engine the armature is mounted on a sleeve that loosely incloses the axle without touching it. At each end of the armature there are five stout radiating arms that fit into hollows in the interior surface of the drivers. This arrangement, combined with the springs by which the motor is suspended, protects the armature which is an elaborate piece of mechanism from the effects of the jolting.

But the most novel feature of the new plant, perhaps, is the form of the trolley and overhead conductor adopted. The latter, as previously stated, consists of an iron conduit, made of two bars of angle-iron and a cover-plate, bolted to, but insulated from, a crossbar. The road is a double-track road, and hence there are two of these conduits attached to the cross-bar. The troughs are not over the centre of each track, but a little to one side; in fact, nearly over one rail. In this lateral displacement the two troughs are moved toward each other. The current, which is brought from the power-house by cables to the iron conductor, is taken off from the latter by a brass shoe, a shuttle-shaped block sliding along in the trough and rubbing against the iron. This substitute for the old trolley wheel is attached, not to a pole such as on the ordinary electric car, but to a diamond-shaped frame, jointed at the corners in order to give it elasticity, and also mounted so as to swing sideways. Seen from in front or behind, this frame slants over a good deal, and it prevents the rocking and jolting of the engine from jerking or straining the connection with the shoe. One of several reasons for putting the electric conductor on one side is to keep it out of the way of freight brakemen's heads in the tunnel, where it is hung down within three or four feet of the level of the car roof.

Towing by Electricity.

The method by which it is proposed to apply electric energy for towing boats on the Erie canal is as follows:

A line of steel posts fourteen feet high and 150 feet apart is set along the bank of the canal. These posts carry two steel cables, the upper one being an inch and a half in diameter and the lower one an inch. A motor car is suspended from the upper cable, which bears the entire weight of the car. The motor is connected directly with the driving shaft, around which the lower cable is twice passed in such a way that the movement in either direction by the motor moves the car accordingly. The motorman has a seat in the suspended car, which consists of nothing more than a frame heavy enough to sustain the apparatus. A tow line is passed from the car to the canal boat, where it is made fast to the "sampson post," and the procession is ready to move. The motors are of seven-horse power, and can pull two or more laden boats. The electrical current is supplied to the motor through the upper cable, upon which the apparatus travels, and is returned to the power station through the lower cable, thus securing a perfect metallic circuit, which is said to be more economical than the circuits on most trolley street railways. A similar apparatus, it is said, is being successfully used in lumber hauling at mills in North Carolina.

What Blackens Incandescent Globes.

An Italian scientist has been trying to add to the comparatively small available store of information as to how the blackening of incandescent bulbs is caused. He found that under the microscope the surface of a used filament has little heaps, resembling in miniature those on the carbon of an arc lamp. They seem to have been produced by some melted material. In places the filament is furrowed by transverse cavities, out of which rise ramifications of lamp black. The film collected on the inside of the lamp shows under the microscope as a very thin coating of lamp black, in which are distinguished larger grains irregularly distributed, and also yellowish crystals. His explanation of the blackening is that certain mineral substances contained in the carbon filament become fused by the high temperature and evaporate. This causes a gradual disintegration of the carbon, some very minute particles of which are projected onto the glass. When the explosion of the little humps on the filament are at all violent, entire fragments are detached, and at these places where detachments occur most frequently the filament breaks.

Electric Power Salable.

An incident is reported from Niagara Falls, which illustrates the readiness of manufacturers to utilize electric power. It has been generally expected that Buffalo would be a large user of the electric power generated by the Cataract Company at Niagara Falls. Considerable delay has taken place in the negotiations between the city and the company for the power, and in the meantime another customer has arisen. According to a Buffalo paper, "While Buffalo is dickering for Niagara Falls power and talking about impossible restrictions, Depew has made a bid for it, and literally goes half way to get it. In all probability Depew will get the power before Buffalo does." As a matter of fact Depew, a growing town, eight miles from Buffalo, actually stepped in, and pre-empted a large amount of the power for which Buffalo was somewhat too complacently bargaining. The town has large locomotive shops, coupler works, etc., and in the acquisition of the new power it has made a big bid for prosperity.

In order to persuade a trolley current to effect its return along the rails, it is usual to connect the latter with copper wires called bonds. Great difficulty has been experienced in attaching a bond so that its contact will not be impaired by contraction and expansion, the jar of travel or rust and dirt. In what is called the "plastic bond," a new thing, a soft, paste-like compound is used to conduct the current from each rail to a flat iron bar or fish-plate, which is bolted to both rails as on steam railways. The surfaces of rail and bar are cleared by a scraper or emery wheel and then rubbed with an anti-rust amalgam or alloy. A flat ring of cork, five-eighths of an inch thick, and having an inside diameter of one and one-half inches, is then attached to the steel by means of an insulating cement. The core is filled with the plastic conducting material inclosed in a steel spring, which squeezes it out sideways, and then the splice-bar is bolted down over the cork and composition so as to make a perfect contact. It is claimed that bonds of this sort have been in use four years without showing deterioration. The plastic material always remains soft.

The Union Street Cable Road in this city is to be changed into an electric road. It is expected the work will be completed by March 1st, '96. The steep grades will be furnished in the same manner as that previously described in the case of the Fillmore Street line near Broadway.

Market Reports.

The Markets.

SAN FRANCISCO, July 25, 1895.

Copper continues to advance. It is reported that the Calumet & Hecla's sale at 10¾ was for 10,000,000 pounds. The half million pounds Lake sold in Boston last week was at 11¼, which resulted in putting it to 11½ there. The latest New York exchange prices are 11.40. Silver varies very little. Local markets are practically unchanged. Regarding coal J. W. Harrison's current circular says: "As the total arrivals of Australian coal since May 20th are less than 20,000 tons, the amount in yard at present is almost nil. Yet in the face of such slim arrivals, our yards are fully supplied with fuel for general uses, principally British Columbia products. With yards well filled and 165,000 tons listed from Australia and 130,000 tons from Swansea, the major portion of which should arrive here in six months, it becomes an assured fact that low prices must prevail. The strain for wharf and yard room will he felt in about ninety days hence, and all unsold cargoes arriving about that time will he the sufferers. It is reported that coal tonnage is not being freely offered for here for later loading; this may lead to stiffening of values after the turn of the year, as it is very duhious if seductive grain freights will prevail ahout Decemher or January next. Swansea coals are still offered for future delivery considerably helow Colonial; this handicaps any advance in the near future of all steam coals. The gas companies are now using hut little bituminous, principally anthracite and oil."

New York Metal Market.

Mining Share Market.

SAN FRANCISCO, July 25, 1895.

Stocks sagged worse than ever during the week, sales being almost lifeless. The condition of the street has nothing to do with the conditions of the mines listed on the Stock Exchange, which make a better showing than heretofore. This week the pendulum swung one way.

The Crown Point earned its expenses and a little more in June.

The following illustrates the changes of the week:

MINES.	18	25
Alpha	.....	.....
Alta Consolidated	.....	.....
Andes	$ 31	.....
Belcher	33	$ 31
Best & Belcher	96	87

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 16, 1895.

542,920.—ROTARY ENGINE—D. Berry, Fish Rock, Cal.

542,701.—BITUMINOUS ROCK MACHINE—E. F. Badgley, S. F.

542,821.—HOP-TRELLIS—Boughton & Briggs, Clymer, Or.

542,796.—COIN RECEPTACLE—A. W. Coffin, S. F.

542,797.—ASH AND SOOT PAN—H. Colman, S. F.

542,798.—FAUCET—W. Curlett, S. F.

542,730.—ANIMAL TRAP—C. Fliedner, Portland, Or.

542,679.—TELEPHONE—Hopkins & Elsom, Spokane, Wash.

542,734.—DISH DRAINER—C. N. Johnson, S. F.

542,856.—SAW—J. W. Johnson, Truckee, Cal.

542,861.—BROOM—T. H. Palmer, San Bernardino, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Kendall et al., in the Sharp Mine, near Brandy City, Sierra Co., to impound tailings in Sharp Ravine, an old pit, and on the bank of the north fork of the Yuba River; from W. R. Atkinson et al., in the Homestake Mine, near Gold Lake, Sierra Co., to impound tailings in a ravine; from Toland & Langdon, in the Corkscrew Placer Mine, near Spanish Ranch, Plumas Co., to impound tailings in ravine below the mine and on bank of Spanish Creek; from Henry Goering, in the Last Chance Mine, near Gold Lake, Sierra Co., to impound tailings in a dry ravine; from James Chapelain, in the Chapelain Quartz Mine, near Rackerby, Yuba Co., to deposit tailings in Honcut Creek; from Luigi Lagomarcini, in the Romonie Mine, near Loganville, Sierra Co., to impound tailings in an old pit; from T. T. Kirkham, in the Big Ravine Mine, near Blue Tent, Nevada Co., to impound tailings in ravine below the mine; from the Interior Development Co., in the Brown Placer Mine, near Michigan Bar, Sacramento Co., to impound tailings on flat ground near Arkansas Creek; and from the Cascade Water and Mining Co., in the Cascade Mine, Beckwourth Tp., Plumas Co., to impound tailings in Grizzly Creek, gives notice that a meeting will be held at Room 92, Flood building, San Francisco, Cal., July 29th, 1895, at 1:30 P. M.

WANTED!

A COMPETENT MILL MAN,

Who understands Vanner Concentration and plate amalgamation, as assistant in a 50-ton concentrating plant in northern Mexico. Salary $125 U. S. Currency per month. Must be thoroughly sober and well recommended. A married man preferred. Address B. D., care this office.

QUICKSILVER!

—FOR SALE BY—

The Eureka Company,

OF SAN FRANCISCO.

ROOM 1. · 426 CALIFORNIA STREET, SAN FRANCISCO.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOULD AND CURRY SILVER MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the second (2d) day of July, 1895, an assessment (No. 76) of Fifteen (15c) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room No. 68, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixth (6th) day of August, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the Twenty-eighth (28th) day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 68, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 5th day of July, 1895, an assessment (No. 27) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 12, rotunda, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 4th day of September, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. W. SARGEANT, Secretary.

Office—Room 12, rotunda, Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of May, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
John E. Todd	5	2,500	$ 50 00

Louise V. Rugg	36	10,000	200 00
A. U. Rugg	33	16,667	333 34

And in accordance with law, and an order from the Board of Directors, made on the 24th day of May, 1895, so many shares of each parcel of such Stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, corner Montgomery and Market streets, San Francisco, California, on Monday, the 22nd day of July, 1895, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, California.

POSTPONEMENT.

By a resolution of the Board of Directors of the Gold Bar Consolidated Mining Company the day of sale of the above delinquent stock has been postponed to WEDNESDAY, August the 21st, 1895, at the same place and at the hour of 2 P. M.

E. C. GODFREY, Secretary.

Office—Room 38 Crocker Building, San Francisco, California.

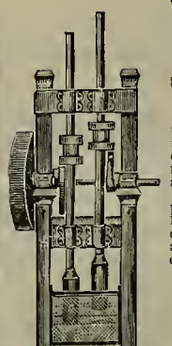
AGENT IN SAN FRANCISCO:
NEWTON M. BELL, 109 California Street.

A Full Assortment of Wire Rope for Mining Purposes carried in San Francisco.

WANTED!

To Rent or Buy

A DIAMOND PROSPECTING CORE DRILL



FOR UNDERGROUND WORK.

Complete, in working order. To be run by compressed air and drill from 300 to 1000 feet. Give terms or spot cash price, and all particulars at once. "The Sullivan" preferred.

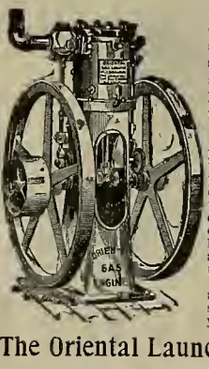
BOX NO. 23, CRESCENT MILLS, PLUMAS COUNTY, CALIFORNIA.

The Briggs

TWO-STAMP MILL,

850-lb. stamps; weight of mill, 6000 lbs.

The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.



Complete as per cut, price **$450.00.** This mill is furnished with 9-inch cast steel shoes and dies, and substantial independent iron guides.

Western Manufacturing Company,

114 and 116 Mission St., San Francisco,

Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

The Oriental Gas Engine

IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

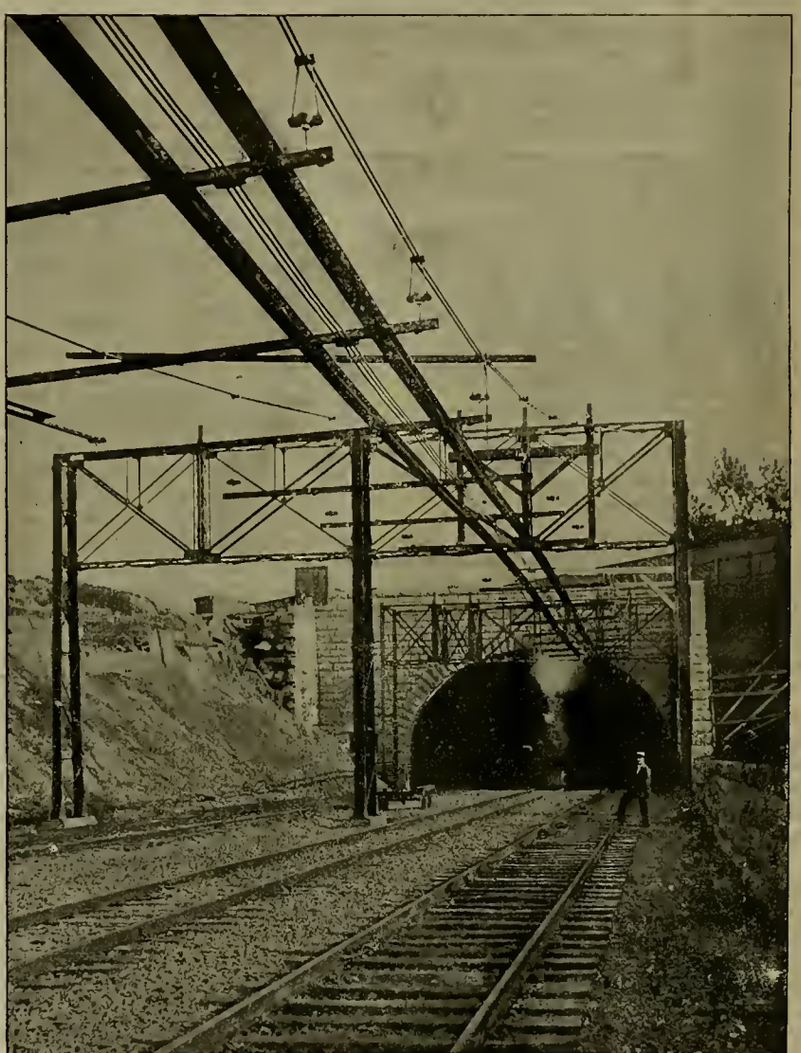
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 5. SAN FRANCISCO, SATURDAY, AUGUST 3, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



The B. & O. Belt Line Tunnel.

Much has been written about the suppression of the steam locomotive by the electric locomotive in railway service. The nearest approach to the actual substitution of electricity for steam in railroad work under ordinary conditions is found in the case of the belt line tunnel at Baltimore. An account of the work recently inaugurated there and of the plant by which the power is generated, transmitted and applied will be interesting to many of our readers.

Previous to the completion of the Baltimore tunnel, all trains of the Baltimore & Ohio road between Baltimore and the north were required to be transferred by ferry, to the great disadvantage of that road in point of time, other lines having an all-rail route through the city. The substitute for the ferry, and what is now known as the belt line, runs from Camden station to Bay View, a distance of a little over seven miles, and includes the tunnel. The tunnel has a length of 7339 feet, is 27 feet wide and 22 feet high, and was built through soft earth underneath Howard street in the center of the city. The cost was $225 per lineal foot.

It is understood, of course, that this line is to be used for the transfer of whatever trains running upon either end of the main line may require to be transferred, and the advantages of the use of some power other than steam, both in the tunnel and at the approaches in the heart of the city, are obvious. The work of providing an electric locomotive of sufficient power for the purpose was undertaken by the General Electric Company, after several other schemes of traction failed. This part of the work as well as the entire equipment was taken in charge and completed by that company. The specifications called for locomotives sufficiently powerful to push or pull passenger trains of 500 tons, including the steam locomotive, at a speed of 35 miles per hour, and freight trains of 1200 tons at 15 miles per hour, on a grade of 0.8 per cent. The plant was to cover the generation of power and current for lighting.

The northern section of the engine-room contains the lighting plant, consisting of eighty 50-light Thomson-Houston arc generators, and two alternators for the incandescent lamp service in the tunnel. The arc light machines are belted to two cross-compound 250-H. P. engines, $16\frac{1}{2} \times 23 \times 19$ inches. Two other engines of similar capacity drive the two alternators, and space has been left for an additional engine and alternator. Each alternating generator has a capacity of 2000 sixteen-candle power lamps, and as the tunnel is lighted by 1000 thirty-two-candle power lamps, one alternator will suffice for the present illumination of the tunnel. Facing the lighting plant, on the east side of the room, is the lighting switchboard, also of polished white marble. It consists of one standard, twenty-circuit, arc lamp plug board to which only sixteen circuits are at present connected; three alternating generator panels, one of which is left blank, and one feeder panel.

OVERHEAD CONSTRUCTION AT ENTRANCE TO BALTIMORE BELT LINE TUNNEL.

INTERIOR VIEW OF THE TUNNEL, SHOWING LIGHTING ARRANGEMENT.

From the positive bus on the railway switchboard, eight cables of stranded copper, each of 500,000 C. M. cross-section, or a total cross-section of 4,000,000 C. M., pass to the overhead structure immediately outside the power-house, where connection is made to three feeder cables, of 1,000,000 C. M. cross-section each, and to the overhead conductor itself, which has an equivalent of 1,000,000 C. M. cross-section. The negative bus is similarly connected to the rails, which are double bonded with No. 0000 wire, and also to the return cables laid in a wooden box beneath the tracks. Perfect contact between bonds and web is obtained by using a hollow rivet on each end of each bond and expanding it, when inserted in the rail, by means of a conical steel pin.

The distance over which the electrical locomotives will operate is about 15,000 feet, passing through two tunnels, 7339 feet and 265 feet long, respectively, and over 7396 feet of track in the open.

The most interesting portion of the installation is, of course, the locomotives. Electric locomotives of such weight and power had never before been conceived, but it has always been a rule in American electric railway practice from the beginning, to push ahead where improvements were possible and make the results realize the expectations, and there has been no departure from the rule in this case. The ninety-six-ton electric locomotive is a success.

The General Electric Company undertook the task of building these machines, and the tests made on the one completed, before it left the Schenectady shops, showed that it is fully equal to all reasonable require

TABLE OF CONTENTS.

ILLUSTRATIONS.—Overhead Construction at Entrance to Baltimore Belt Line Tunnel; Interior View of the Tunnel, Showing Lighting Arrangement, 69 End View of Electric Locomotive; One of the Ninety-six Ton Electric Locomotives Used in the Baltimore Belt Line Tunnel; Interior View of Power Station, 72.

EDITORIALS.—The B. & O. Belt Line Tunnel, 69-72-73. Commissioner of the General Land Office; El Dorado Canyon; Assessment Work; American vs. English Mining Machinery; Proposed Smelter at Vancouver; W. Hamilton Smith Inspecting British Columbia Mines; "What to Exhibit in Mexico;" Suit Against Supt. Lyman; The Placer County Contest; "Clear List No. 54;" Personal Heroism on the Part of Miners; The Argument in Full, 70.

MECHANICAL PROGRESS.—Standard of Horse Power; Cut and Wire Nails Compared; To Insure Tight Joints in Pipes, 75.

SCIENTIFIC PROGRESS.—Compressed Air in the Machine Shop; Building a Steam Engine Fifty Years Ago; Lining Basic Open-Hearth Furnaces; Welding of Metallic Bodies; Scale in Steam Generators, 75.

ELECTRICAL PROGRESS.—The Electric Furnace; New Telephone Company's Wire Between Sacramento and Folsom, 76.

PRACTICAL INFORMATION.—New Wind Engines for Pumping; Bullets for the Navy Rifle; Deposits in Kitchen Boilers; Nonsense about Aluminum; A Man of Titles, 76.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 78-79.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 82.

MISCELLANEOUS.—Concentrates, 71. The Game Laws; Wood Work of Interior of Men-of-War Fireproof; Submarine Telephone Cable Between Montevideo and Buenos Ayres; Boulder Burst; For Powder Smoke; British Extension in Africa; Making Idols; Sunshine in California, 73. From Steam to Electricity; "Value of a Ton of Ore;" International Geographical Congress; The Gold Yield of Europe; Importation of Flaxseed; Bolandite; Coast Industrial Notes; Obituary; Salt Lake, Utah, Mines, 74. Notices of Recent Patents, 79.

THE country seems to require the services of a commissioner of the general land office. At present that important position appears to be filled by an attache of the railroad company.

EL DORADO CANYON, the Mecca of many prospectors, is attracting renewed attention. Several different parties have gone in there during the month. It is where California, Nevada and Arizona come together and is a hard country to reach, stay in or leave.

ANOTHER statement about assessment work has been started and is appearing in several newspapers that assessment work for '95 must be done by October 1st. It would be just as well to have it done by that date, but holders of unpatented claims have till December 31st to do the required amount of work for this year.

Machinery, published in London, derides the statement in another London journal that the United States "excels England in the manufacture of machinery for mining purposes, and has distanced all competitors." *Machinery* claims that Great Britain furnishes more mining machinery to British colonial mines than this country does, which is so, and also claims that English mining machinery is superior to American, which is not so.

A VANCOUVER, B. C., JOURNAL asserts that if the proposed smelter is built there it will give steady employment to 250 men. Hardly; as a 100-ton proposition. The smelter now in operation at Tacoma, Wash., keeps a 100-ton stack going; under date of July 14th the secretary of the company writes us that their total pay roll carries sixty-two men. The Pilot Bay smelter is also of 100 tons daily capacity, but gives employment to about the same number as the one at Tacoma.

W. HAMILTON SMITH, a former Nevada county miner since grown famous as a mining expert, is inspecting British Columbia mines. Mr. Smith's favorable report on the extent and permanency of the South African gold fields some time ago attracted considerable attention and continues to be quoted. It is perhaps news to many that, till recently, Mr. Smith had sundry shares in a South African mining corporation which he has entirely disposed of, selling them to other fortunate men.

THE *California Architect and Building News* for July has a good article entitled "What to Exhibit in Mexico." It shows how important in a business sense it is to every American manufacturer to make appropriate exhibit at the International Fair which begins in the City of Mexico April 2, 1896. This exposition is an opportunity for California to extend its trade, for all Mexico and Central America, and a large part of South America, will be represented there by the wealthiest and most enterprising of their citizens.

THE midsummer monotony of mining stock operations was varied during the week by E. S. Spring, who announced intention to bring suit against Superintendent Lyman, of the Con. Cal. & Va., to compel that official to give a detailed account of his management of mine affairs, an explanation of some of his reports and other matters. He claims that the superintendent has bought stock and worked the street and the mine to the detriment of the stockholders. He represents several thousand shares and will begin proceedings in the U. S. Circuit Court of Nevada.

THE register and receiver of the Sacramento land office have decided the Placer county contest against the miners and in favor of the C. P. R'y Co.—that is, in the face of facts, they decide that the Forest Hill divide is "agricultural land." The property has on it a valuable placer claim; another part of it has another claim bonded to the Gray Eagle Co. for $30,000, and a tunnel is being run. If that land is "agricultural," then the Idaho-Maryland mine is a potato patch and the Utica fit only for raising alfalfa. One is just as "agricultural" as the other. The law is all right, but its interpretation is an outrage upon human rights.

BY a travesty of justice and in defiance of the plainest provisions of the law, the miners' protests against railroad filings on "Clear List No. 54" have been disregarded by Commissioner of the Land Office Lamoureux, and over 200,000 acres in the counties of Placer, El Dorado, Sacramento, Nevada and Sierra have been adjudged as "agricultural land." Though within a defined mineral belt and expressly exempted by the very law invoked for their absorption, the U. S. official prostitutes his high position in technical quibbling. The railroad attorneys, including Mr. Lamoureux, and the railroad newspapers all say that this is "in accordance with law," when the most cursory reading of the law shows that the action taken by the Department is strained, biased and with evident desire to evade its plainly expressed mandate. The remedy lies in the Supreme Court. That tribunal has never been corrupted and can be depended upon to administer justice.

NOW and then the heart of humanity is thrilled by tidings of heroic action on land and sea in time of danger. Among those noble records are many instances of personal heroism on the part of miners. That action of Supt. Lane, at the Utica mine fire last week, is a case in point. Risking death he went 1100 feet underground amid flame and poisonous gas to save, if possible, seven fellow mortals, overcome in the burning depths, and brought them safely to the surface. There died at St. Mary's hospital at Virginia, Nevada, last week a man—Arthur Van Dusen—who deserves the same honorable mention accorded in song and story to earth's bravest. 'Tis now over thirteen years ago that a bulkhead in the Alta mine at Gold Hill, Nevada, burst, flooding the lower levels with scalding water. Seven unfortunate miners were entombed in a drift on the 2150 foot level, 1400 feet from the shaft; the end of the drift where they were was fourteen feet raise, and the water rose two feet above the level. Compressed air was forced into the drift and the pumps kept going. Forty-eight hours after the accident two men—Denis Callahan and Wm. Bennet—tried to reach the imprisoned men but lost their lives. No artillery flashing over conquered field ever sounded for greater bravery than that displayed by these men—their bodies were afterwards found with the flesh partially cooked. At midnight on the third day Van Dusen succeeded at peril of his life in reaching the men, and eighty hours after the accident he brought them out, starving, exhausted but alive. The coast rang with his praise, but with the modesty characteristic of men capable of such deeds, Van Dusen declined all testimonials, saying he had simply done his duty and was delighted that his fellow miners were saved. He continued to fill his humble position till a year ago, when his health failing he went to the hospital where he died. All honor to his memory and the memory of all such men!

The Argument in Full.

Reference was made last week to the brief forwarded by the chairman of the Protection to Mineral Lands committee, in the case wherein an appeal is made to the Secretary of the Interior from the dismissal by the Commissioner of the General Land Office of a protest against the issuance of a patent to the S. P. Co., for a tract of mineral land in the Los Angeles district. In response to numerous inquiries, the full text of the brief is published, which is a clear exposition of the entire case.

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C.

In re
SUPPLEMENTAL CLEAR LIST NO. 22, SOUTHERN PACIFIC RAILROAD COMPANY, BRANCH LINE.
(Los Angeles District.)

Brief for Appellant, Edward F. Benjamin.

STATEMENT OF THE CASE.

This proceeding arises under the provisions of the instructions of the Honorable Secretary of the Interior to the Commissioner of the General Land Office, dated July 9, 1894. In pursuance of these instructions and by virtue thereof a verified protest was filed by the applicant against the issuance of patent to the Southern Pacific Railroad Company, a corporation, of the list of selections by such corporation made, embracing 24,901.52 acres of land situate in the Los Angeles Land District, and specifically described in said protest, on the ground that such lands, tracts and legal subdivisions are excepted from the grant to said corporation because such lands, tracts and legal subdivisions are mineral lands and more valuable for mineral than for agricultural purposes. A hearing to determine the character of such lands, tracts and legal subdivisions, therein specifically described, was prayed for in said protest.

This protest was dismissed by the said Commissioner on the ground that "It is not believed that the instructions of July 9th provided for hearings where large numbers of tracts, as in this case, were alleged to be mineral," and "while the mineral affidavit of the petitioner fully meets the non-mineral affidavit of the company's agent, filed with the list of selections, yet in view of the fact that the publication has been regularly made and no specific protest filed, the protest herein, in its present form, is not considered sufficient to warrant an order for a hearing as prayed for."

From that order of dismissal this appeal is taken.

ARGUMENT.

I.

Under the instructions of July 9, 1894, no discretionary power is vested in the Commissioner of the General Land Office to order or deny a hearing.

The Secretary of the Interior is the guardian of the people of the United States over the public lands. The obligations of his oath of office oblige him to see that the law is carried out, and that none of the public domain is wasted or disposed of to a party not entitled to it. He represents the Government, which is a party to interest in every case involving the disposal of the public lands. And the phrase "under the direction of the Secretary of the Interior" as used in Sections 453 and 2478 of the Revised Statutes with reference to the status of the Commissioner of the General Land Office is not meaningless, but was intended as an expression, in general terms, of the power of the Secretary to supervise and control the extensive operations of the Land Department of which he is the head. Knight vs. Land Assn., 142 U. S. 161.

The Secretary of the Interior, as head of the Land Department, issued certain instructions on July 9, 1894, in the matter of the selection by railroad companies of lands in satisfaction of their grants, which were to be observed in determining whether the lands selected were mineral or non-mineral lands, which were directed to his subordinate, the Commissioner of the General Land Office (Patterson vs. Tatum, 3 Sawy. 164), and which, among other things, contain the direct and positive command that said Commissioner shall order a hearing in the local land office in each case "in regard to lands protested, or contested, or claimed to be mineral, or concerning which *any suggestion* has been made, or report by the register and receiver as to their mineral character."

The Act of Congress making the grant to the railroad company excluded the mineral lands and the statute not having prescribed the mode of proving the character of land lying within the limits of a railroad grant, it is the duty of the Land Department to determine the character of such lands, and a regulation of the Department, if not repugnant to the Act of Congress, may permit this to be done by some recognized mode of proceeding.

The instructions were intended to give wide latitude as to the manner in which information of the mineral character of such lands could be conveyed to the Department, and a mere "suggestion" or "report" was declared to be sufficient to warrant a hearing to be ordered "*in each case.*" But the Commissioner refuses to order a hearing "*in this case*" because, he says, "it is not believed that the instructions of July 9th provided for hearings where large numbers of tracts, as in this case, were alleged to be mineral," as "it is the uniform practice of the office to require petitioners for hearings to specify the tract or legal subdivision alleged to be mineral," although he concedes it to be a fact that the "mineral affidavit of the petitioner fully meets the non-mineral affidavit of the company's agent, filed with the lists of selections."

An inspection of appellant's protest shows that it fully complies with "the uniform practice of the office" in this, that it contains a particular description of each tract and legal subdivision involved, and then "specifies" that *all* of such tracts and legal subdivisions are mineral lands and more valuable for mineral than for agricultural purposes. If *all* of these lands are of that character, and appellant alleges in his protest that he is so informed and believes, how can there be any segregation of that which is indivisible? or, how can it be held that there is a failure "to specify the tract or legal subdivision alleged to be mineral," when it is alleged that *all* the tracts and subdivisions *are mineral?* If "the uniform practice of the office" requires anything more than this, it requires that which is practically impossible. But "the uniform practice of the office" does not control in this class of cases, as they are governed by a special code of rules (July 9, 1894).

If the instructions are subject to construction they should receive a practical common sense construction with reference to the mischief intended to be remedied by the change—that is, the issuing of patent without the investigation and consideration which the public interest requires. Barden vs. Northern Pacific, 154 U. S. 288.

A mischief which will always exist as long as there are

any lands to be selected by a railroad company. If the Government continues to rely upon hearsay affidavits and reports of deputy surveyors "whose reports have no binding force," and to raise purely technical objections against the sufficiency of information which it has invited from the public at large and which is fully as definite as any furnished by the railroad company.

If, as the Commissioner finds, the protest herein "fully meets" the non-mineral affidavit of the company's land agent, the case, viewed in that light, is properly at issue, and its dismissal is merely an officious act on the part of the Commissioner; and the Secretary of the Interior would not perform his duty, stated in Knight v. Land Association, 142 U. S. 161, as the "supervising agent of the Government to do justice to all claims and preserve the rights of the people of the United States," by certifying the list until corrected in accordance with the discoveries made known to the department. Barden v. Northern Pacific, 154 U. S. 288.

But, whoever heard of a judicial tribunal dismissing a case *ex mero motu*, after finding that the pleadings on both sides "fully meet," but were not precise enough on one side to warrant the case being set down for trial, and therefore judgment must follow for the other side whose pleading is acknowledged to be no more precise! Yet such action would be analagous to that of the Commissioner in dismissing this protest for the reasons given. True, the additional reason is given that "publication has been regularly made," but persistent examination of the statutes fails to disclose any provision changing the character of land because of that circumstance. Congress never intended that the "uniform practice of the office" or "publication" of a railroad list of selections "regularly made" should have the effect of transmuting mineral land into non-mineral land or that a departmental regulation should add to the law, render its enforcement difficult, burden the proceedings under it with unnecessary expense and hardship or to encumber them with onerous and technical conditions. Anchor v. Howe, 50 Fed. R. 366.

The Commissioner also commits the mistake of supposing that these instructions are so ambiguous as to require extrinsic aid in their construction, and by ingenious refinement he proceeds to give them a meaning that the Secretary never intended they should have. The Commissioner's reading of these instructions leave it optional with him whether to order a hearing or not as he sees fit, although it is a well settled rule of law that directions in a statute which are of the essence of the thing to be done are mandatory and not directory. It is to be presumed that the Land Department has no favors to bestow and designs to inflict no arbitrary deprivation of rights, but the practical working of these instructions results in the bestowal of certain rights and privileges upon railroad companies which are obnoxious to their grants in making them the judges of their own cases by permitting them to file hearsay affidavits as to the character of the lands which they select for patent and which affidavits are taken as conclusive evidence that the lands are non-mineral in character and therefore subject to "approval and patenting as agricultural" regardless of their true character, unless a protest is filed which is sufficiently precise to warrant consideration by the Commissioner. In which event a hearing would be ordered to determine whether the land is "more valuable for mineral than for agricultural purposes," which is a distinction not drawn in the Acts of Congress, but which, says the Supreme Court in the Barden case, *ante*, "may be sound because of the difficulty which may arise in many cases to ascertain with accuracy whether the lands to be disposed of are to be deemed mineral lands or agricultural lands." But this difficulty is easily overcome by giving the affidavit of the railroad company's land agent a conclusiveness which is denied, and properly denied to a protest, even when it is deemed of sufficient weight to warrant consideration by the Commissioner.

The Commissioner's construction of what is required of a protestant is harsh, oppressive and unreasonable, is unwarranted by the instructions of July 9, tends to embarrass the administration of the law and diminishes the rights of the Government in the public lands by practically adding to the grant a right to lands which are expressly excluded from the grant.

II.

The instructions of July 9th, 1894, are beyond the proper scope of the jurisdiction of the Land Department.

The source of the right of the railroad companies to lands lying within the alternate sections granted to aid in the construction of the road is in the Acts of Congress making such grants, which expressly exclude the mineral lands from such grants; and in Barden v. Northern Pacific, *ante*, it is said that selections of the land by a railroad company, as a part of its grant, shall not, in any respect, change its purport and effect or eliminate any of its reservations; nor does it empower the officers of the local land office (or their superiors) to accept the list as conclusive with respect to such grant in any particular. The determination of the character of the land granted by Congress, in any case, whether agricultural or mineral is placed in the Land Department and under its direction and supervision the actual character of the land may be determined and fully established.

Among the questions, therefore, which the Land Department is called upon to determine, when a railroad company makes application for a patent for lands lying within the limits of its grants, is whether such land is agricultural or mineral in character. This duty is not performed in promulgating rules and regulations which provide for an arbitrary determination of the question without any investigation upon the part of the Land Department.

For instance, the rules and regulations of July 9, 1894, provide that if a railroad company selects lands that are not within a radius of six miles from any mineral entry, claim or location, they shall be patented as agricultural land, and if the lands selected are within such radius, then, unless objection is made within a certain time, they, too, shall be patented as agricultural land. That is to say: that under certain conditions all lands lying within the limits of a railroad grant are to be deemed and taken to be agricultural lands, regardless of their true character, although there is nothing in the laws of Congress which provide that remoteness or contiguity to a mineral entry, claim or location, cuts any figure in the matter or that all lands are agricultural if no one happens to assert that they are more valuable for mineral than for agricultural purposes. The acts of Congress excluding the mineral lands from railroad grants cannot be supplanted by a rule or regulation of the Land Department. The right to enforce and carry into execution by appropriate regulations every part of the provisions applicable to the disposal of the public lands is not a grant of power to legislate; to add to the law, it is designed that the permitted regulations shall be reasonable and within the limitations and intent of the statute in the enforcement of which they are designed to aid. Anchor v. Howe, 50 Fed. Rep. 366.

The rules and regulations of July 9th, 1894, vary, add to and encroach upon the law in providing that all lands lying within the limits of a railroad grant may be patented as agricultural land whether in fact mineral or non mineral in character, "for the grant only passes a title to non-mineral land, yet the patent may be conclusive in subsequent proceedings respecting the title," and the result is that while the Land Department cannot, theoretically at least, grant land, yet practically it grants to a railroad company the very lands which Congress says it must not have. It is the plain duty of the Land Department to make full investigation of the matter and assure itself that the lands embraced in a railroad list of selections are not of the prohibited class, and if the means are denied it, by want of appropriate legislation, of reaching a proper determination of the question it should not seek to supply the deficiency by declaring that all lands shall be considered as agricultural because of their position or the happening, or not, of certain contingencies.

The delay of the Government in issuing patent to a railroad company does not affect the power of the company to assert in the meantime, by possessory action, its rights to lands which are in fact non-mineral (Barden v. Northern Pacific, *ante*) and it therefore follows that no harm follows delay in issuing these patents and that there is no actual necessity for the summary proceedings provided by the rules and regulations of July 9th, 1894, which only serve to materially add to and enhance the value of the railroad grant without any corresponding benefit to the Government or people. "The mineral lands," says Mr. Commissioner Lamoreux, "should be preserved for our people, and there is no claim on the part of the railroads to obtain these sources of vast wealth not intended for them that should be tumored to the least degree beyond the law. This I say in no spirit of hostility to the railroad companies, but from a thorough conviction that the best interests of the Republic would be served by dividing this vast mineral wealth among individuals, rather than by allowing it by any means to fall into the possession and control of large corporations. It is not intended to be granted to them, and they should not be allowed to obtain it by default. Sufficient means of proving exactly what the character of the land is should be provided."

See letter from Commissioner Lamoreux to Secretary of the Interior, dated August 29th, 1893. Mis. Doc. 258, 53d Cong. 2d Sess. If no proper provision has been made for the determination of the question, then the railroad companies must await appropriate legislation.

Certainly "sufficient means of proving exactly what the character of the land is" is not "provided" by declaring it all to be agricultural land without even the semblance of an examination or the taking of any testimony upon the subject other than an affidavit from an agent of the applicant for patent based wholly upon something that some one else, more or less mythical, has told affiant, who, by the way, is presumably interested in seeing that his employer loses nothing by the proceeding. But the provisions of the rules of July 9th, 1894, concerning the action to be taken upon a suggestion made, information given or report by the local land officers, indicate that the Land Department believed that there was a "sufficient means of proving exactly what the character of the land is" had already been provided and at its command because it is not reasonable to assume that the expense of the presenting of proof thereabout is to be cast upon the local land officers, or upon a party making suggestion or giving information upon that point. But the vice of these provisions as of these rules and regulations generally is that, unless some one moves in the matter, the lands mentioned in the supplemental list are *ipso facto* agricultural lands, "while the fact remains that, under the law, the duty of determining the character of the lands granted by Congress, and stating it in instruments transferring the title of the Government to the grantees, reposes in officers of the Land Department." Barden v. Northern Pacific, 154 U. S. 288.

The passage of the Idaho-Montana Act was certainly an expression of the legislative mind as to the appropriate means for determining the question of the character of the lands lying within a railroad grant, which are diametrically opposite to the rules of July 9th in all essential particulars, but the Land Department has not seen fit to make any modifications in its practice, although there is not a single provision in such law regarding the classification of lands that could not be adopted by the department substituting special agents for the Commissioners provided for in said act, and confining their examinations to such lands as the lists of selections filed from time to time by the railroad companies should designate. Undoubtedly, such action would go far towards providing "sufficient means of proving exactly what the character of the land is," and do away with the objectionable features of the existing rules and regulations, which are not only detrimental to the interests of the Government and the miner, but are clearly void because in conflict with the granting acts of Congress by enlarging the grant to the railroad companies in stupendous fashion.

In conclusion, we respectfully submit:

1. That the rules and regulations of July 9th, 1894, are free from ambiguity in so far as they concern the duties of the Commissioner of the General Land Office and therefore are not subject to construction by him.

2. That the ordering of a hearing, being of the essence of the thing to be done, is mandatory and not directory.

3. That the "uniform practice of the office" in other cases has no controlling effect in the matter of ordering or denying a hearing herein, as it is governed by special rules.

Further, that the rules and regulations of July 9th, 1894, are void in that:

I. They conflict with the acts of Congress excluding the mineral lands from railroad grants, and enlarge and extend such grants by arbitrarily determining the character of all lands selected by a railroad company lying without a radius of six miles from any mineral entry, claim or location, to be agricultural lands, notwithstanding such lands may in fact be mineral lands.

II. They arbitrarily determine the character of all lands lying within a radius of six miles from any mineral entry, claim or location which are not made the subject of a contest, or a protest, or concerning which no suggestion is made, information given or report had as to their mineral character.

III. They provide a mode of proceding to divest the Government of its title without the investigation and consideration which the law and the public interest requires.

A. H. RICKETTS,
Attorney for Appellant, Edward H. Benjamin.

Concentrates.

THE Iron Mt. (Shasta Co.) mill shuts down this week, prior to change of location.

COL. BAKER, Minister of Mines, has started a mining bureau in British Columbia, with headquarters at Victoria.

SPOKANE, WASH., which is the natural commercial center of a great mineral area, wants to hold a mining convention in October.

L. P. DREXLER has bought from the Sunnyside Mining Co. the Sunnyside mine, on the north fork of Feather river, Plumas Co.

THE export of gold from Western Australia for the year ending June 30th, '95, amounted to 239,593 ounces—an increase on the previous year.

A LOS ANGELES MAN who thinks he has a successful process to work refractory ore has bought a Meadow Lake mine for $3000 and will experiment some.

DR. W. D. HUNTINGTON of Oakland, who owns seven acres near Lake Temescal, thinks he has a gold mine there. He has had an assay made of some quartz, which showed $8.50 to the ton.

PERMITS to operate the Last Chance mine, near Sierra Valley, were issued to Henry Goering last Monday, and to Lugi Lagomacini for the Roomie mine, Sierra county, by the Debris Commission. The Homestake mine, Gold Lake, Sierra county, and the Brown mine, Sacramento county, were authorized to erect restraining dams.

THE Cinnabar Mining Company of British Columbia has incorporated at Vancouver; capital stock $100,000. Retorts will be put up and the furnaces built. About fifteen men are engaged in connection with the property, which is on Copper creek.

THE Burton Electric Company was incorporated in this city during the week; capital stock, $1,000,000. Directors—G. C. Perkins, J. R. Kendall, Oakland; J. E. Richards, N. A. Harris, G. E. Davis, C. A. Warren, San Francisco; G. D. Burton, Boston.

THE Hydraulic Mining Company has incorporated at Portland, Oregon; capital, $25,000. Incorporators—J. D. Cook, G. E. Howland and H. N. Scott. Also, the Oregon Bonanza Mining Company, Grant's Pass; capital, $50,000. Incorporators—E. Wade, R. Brown, J. King and S. Baldwin.

THE Norman Mining and Milling Company, whose mines are at Ripsey, on the Gila, below Riverside, Arizona, has levied an assessment of $8 per share on the capital stock of the company, payable before August 6th. The money thus raised will be expended in the purchase of a 20-stamp mill.

THE production of gold in the Witwatersrandt, South Africa, district since regular returns were made in '87 is as follows: 1887, 23,155 ounces; 1888, 208,122; 1889, 369,557; 1890, 494,817; 1891, 729,238; 1892, 1,210,807; 1893, 1,478,473; 1894, 2,024,159; 1895 (six months) 1,113,547; total, 7,651,935 ounces.

AN item in last Saturday's "Concentrates" told of a shipment of Alaska gold to the Helena, Montana, assay office. Usually Alaska gold is sent to this city; the shipment in question was made by the North American Transportation and Trading Co., of which J. J. Haley, a Montana pioneer, is general manager.

THE Washington, Eureka, No. 9, and three other claims near Hornitos, Mariposa Co., have been sold to English parties for $100,000. The Washington has yielded well and has had considerable development work. The other claims have also been worked profitably. There is a 10-stamp mill on the Eureka and a 30-stamp mill on the No. 9.

THREE mining companies were incorporated at Spokane, Wash., this week: The Crown Point Mining and Milling Company, capital $1,000,000; the Kootenai Mining and Milling Company, capital $1,000,000, and the Iron Horse Mining and Milling Company, capital $1,000,000. Incorporators of all three—A. E. Humphreys, W. H. Yawkey, J. D. Farrell, B. E. Barinds and L. F. Gordoa.

THE twelve mineral commissioners appointed by Congress to ascertain the character of the public lands in Montana and Idaho are divided into four parties, three in Montana and one in Idaho. They have so far examined and reported on 30,000 acres out of a total of ten millions. The appropriation is limited to $20,000; the monthly expenses are about $4000. About one-fifth of all the land examined so far has been certified to be agricultural.

THE commissioners of Golden Gate Park are desirous of making a creditable display of minerals, rocks and ores of the Northwestern States in their new museum in this city, and have written to prominent mining men all over the coast for such aid in this matter as they may be able and willing to give. Any specimens of native minerals they send will be correctly labeled in the name of the donor and suitably installed. Wells, Fargo & Co. will carry free of charge all material intended for the museum.

THE production of refined lead in the United States in 1894 was 219,000 short tons. The product of 1893 was the largest on record—229,000 short tons. The lead markets of the United States are supplied from four sources—domestic mining, divided between the soft lead ores of the Mississippi valley and the silver-lead ores of the Rocky mountains; Mexico and British Columbia; base bullion sent from Mexico for delivering and refining in bond in this country; and refined foreign lead. The total domestic production for '94 is estimated at 132,700 tons.

W. LINDGREN, geologist of the United States Geological Survey, appointed by the Secretary of the Interior to examine and report upon the mineral character of School Section 16, within the corporate limits of Tacoma, has filed his report with the land office, in which he says the land contains an extremely small amount of gold, of no value for mining purposes. The land in contest was filed upon by John G. McBride in 1889, and has been contested since. The testimony at the trial showed the value to be a million dollars. The case has been argued before the Interior Department by Attorney-General Jones three times. The testimony at the last examination before the local land office was so conflicting that the Secretary of the Interior detailed Geologist Lindgren to make a special examination, as a result of which he says the average gold deposit is less than ten cents per cubic yard, while at the former hearings, in which McBride was charged with salting, McBride's experts testified that certain strata ran as high as forty-four cents per cubic yard.

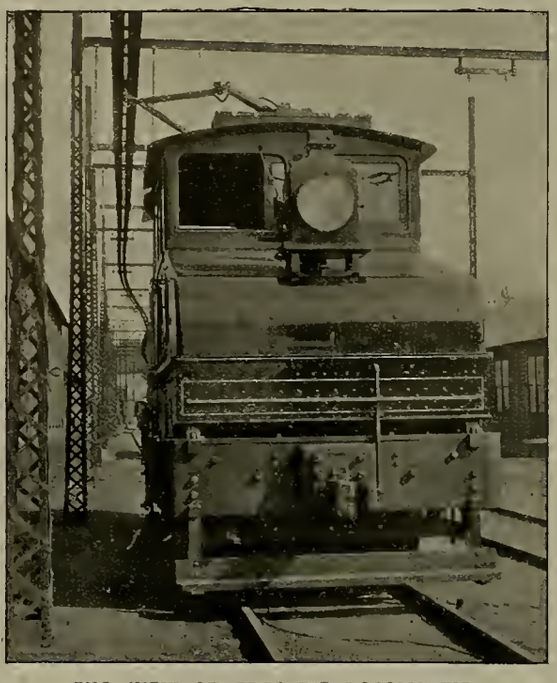
"TO NO ONE THING the stockholders in the Anaconda Copper Company owe more for the tremendous dividends they have pocketed than to the economical and exhaustive manner in which a ton of ore from its mines is handled," says a Butte mining man. "There is not a scrap of waste. Even the water is, by precipitation, made to yield value that comes in the nature of a precipitate carrying from 75 to 85 per cent copper. This precipitation of the waters has been going on for about two years. That it could be done was discovered in a very peculiar way, and upon experiments that were very crude. The first to try it was a miner who knew but very little of the chemical relations of the metals, but who learned that a tin can or piece of iron thrown into the channel through which the waste water was discharged, would attract the copper contained in the water, and save at least a large percentage of it. Experiments followed, and soon every drop of water discharged by the Anaconda and St. Lawrence was being handled for the metal that was in it. Truth is, it is nothing less than a thorough solution of copper, running at the rate of about thirty miners' inches a day out of each of the mines. This volume is raised into tanks, charged with scrap iron and salt. From tank to tank the volume goes until it passes through a circuit of fifteen tanks, over 500 tons of iron, and through from 1000 to 1200 feet of fluming, before it is discharged, and after which it is as clear as coal oil. The contents of the water are now settled in the tanks, and one after another a tank is cut out of the circuit, the iron removed, the copper hammered off, sorted and shipped. It is through this that the least particle of copper contained in the bonanzas of the company is saved."

The B. & O. Belt Line Tunnel.

(*Continued from page 69.*)

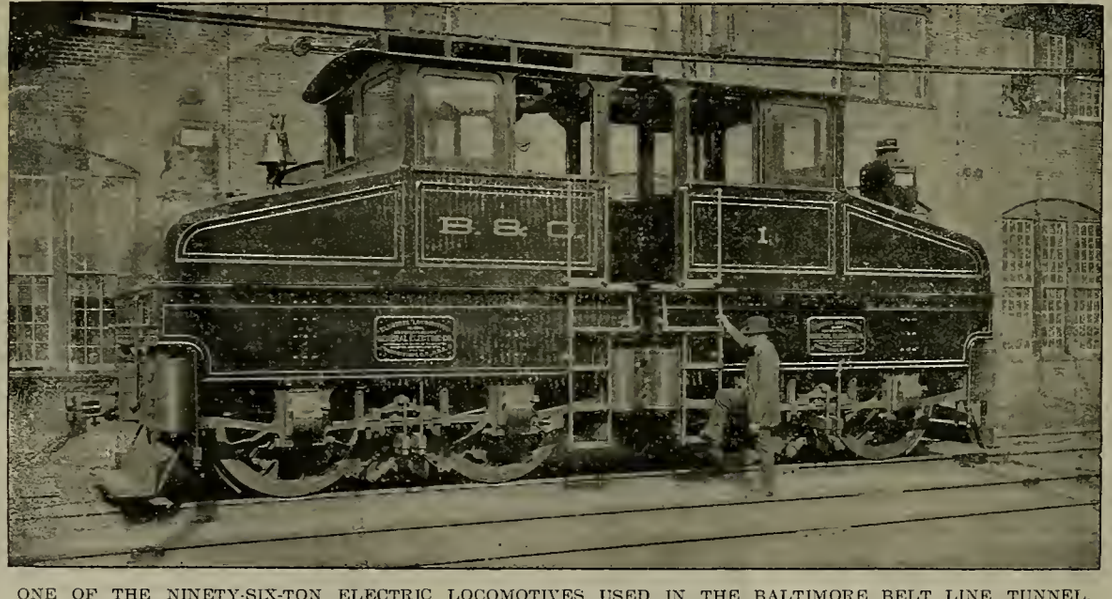
ments of trunk-line service. The dimensions are as follows:

Number of trucks	2
Number of motors	4—two to each truck.
Weight on driving wheels	192,000 lbs. (96 tons).
Number of driving wheels	8.
Drawbar pull	42,000 lbs.
Starting drawbar pull	60,000 lbs.
Gauge	4 ft. 8½ ins.
Diameter of drivers	62 ins. outside of tires.
Length over all	35 ft.
Height to top of cab	14 ft. 3 ins.
Wheel base of each truck	6 ft. 10 ins.
Extreme width	9 ft. 6¼ ins.
Diameter of sleeve bearings	13 ins.



The driving gear cousists of a cast-steel spider shrunk on and keyed to a cast-steel driving sleeve, having a tensile strength of not less than 80,000 pounds. Each arm of the spider is provided with a double ruhber cushion, with a chilled cast-iron wearing cap, the cushion being forced into the arms of the spider and the cap. The eight driving wheels are of cast steel pressed and keyed to the axles, and have tires, three inches thick at centers of tread, shrunk onto the wheel centers. The driving axles are of special open-hearth steel. The journal bearings are outside the driving wheels and allow of easy access to all parts of the truck frame and driving hox. In the design of this are embodied the good features of the steam locomotive driving box and passenger car box. It is of cast iron, with a phosphor hronze bearing fitted on in a similar manner to that of a steam locomotive driving hox. It slides in jaws protected hy shoes in the same way.

The two opposite side frames of each truck rest upon four wheels, each consisting of one piece of hammered wrought iron three and one-half inches thick, to which the frame jaws are welded, and protected from wear by cast-iron shoes, and are connected together at the ends by heavy forged irou plates, with oak humper hcams between them.



The motors are supported on carriers bolted to the field magnets, and rest in adjustable hangers carried on half-elliptical springs placed on top of the frame aud bumpers. The frames thus carry the motors by carriers and springs, and this load is carried in turn by rubber blocks in a cast-iron casing.

The gearless motors are four in number, two to each truck, flexibly supported aud transmitting their power to the wheels through the flexible connections described ahove. They are of pyramidal shape, are the largest railroad motors in the world, and, while ponderous in appearance, are by no means so bulky as might be expected from the heavy work they have to perform.

Each has six poles aud six sets of carbon brushes, the brushes being connected to a yoke revolving through 360° to facilitate accessihility to them. It is possible to remove four brushes without disahling the motor. The field spools arc encased in sheet-iron cases and fitted over the pole pieces holted to the field frame. The armatures are built of sheet-iron laminations, and are series drum wound. They are known as ironclad, each insulated winding being embedded in an insulated slot cut into the outer surface of the armature hody, and held therein hy a wooden key. This armature, with the commutator, is mounted upon and keyed to the hollow sleeve which is carried on the journals on the truck frame. The inside diameter of the sleeve is ahout two and a half inches larger than the axle. The entire motor is practically fireproof. When normally placed the motor rests in a position concentric to the axle, the clearance between thc axle and the sleeve allowing of a flexible support. The interposition of the ruhher cushions, through which the torque of the armature is transmitted to the driving wheels allows the armature to run eccentric to the axle, when the motor departs from its normal position on account of any unevenness in the track. The motor is designed to allow of ready removal of the field frame for inspection or repair. Each motor is rated at 360-H. P. and takes a normal current of 900 amperes.

END VIEW OF ELECTRIC LOCOMOTIVE.

ONE OF THE NINETY-SIX-TON ELECTRIC LOCOMOTIVES USED IN THE BALTIMORE BELT LINE TUNNEL.

INTERIOR VIEW OF POWER STATION.

Contact with the overhead conductor is effected hy means of a sliding shuttle-like shoe of hrass, which is fixed to a flexible support fastened to the top of the cab. This trolley support is diamond shaped aud compressible, contracting and expauding as the height demands, and is arranged to lean on oue side or the other of the overhead conductor. It is, however, rigid in so far as movement forward and hackward over the locomotive is concerned. The current is hrought to the locomotive hy means of cahles connected to the shoe and fasteued to the trolley support.

The conductor is simply a reversed iron couduit or trough erected overhead on trusses in the open and in the tunnel attached to the crown of the arch. In the open the couductor is directly over the center of the track; in the tunnel over the center line of the space hetween the tracks. It extends from Henrietta street on the south to Huntingtou avenue on the north, a distance of 15,000 feet.

The conductor consists of two 3-inch iron Z bars three-eighths inch thick, riveted to a cover plate one-quarter inch thick and eleven and one-half inches wide, and is constructed in sections thirty feet long. It weighs about thirty pounds per foot. At intervals of fifteen feet inside the tunnel there are suspended from the arch, transverse frames, consisting of two 3-inch channels, held together by plates four inches wide, and holding four castings into which are fitted conical porcelain iusulators. In the masonry of thc tunnel are fitted thc bolts necessary to support these frames. They are two and a half feet long, have split ends and extend twelve inches into the masonry. The holts pass dowuward through the outside pair of insulators. The bolts attaching the conductors to the channel frames pass through the iuside pair of insulators and support an iron stirrup in which the conductor hangs. This method affords a double insulation, and if leakage occur it can only be by the current passing the insulators between the conductor and the transverse channel, and theu the iusulation between the channel and the bolt in the tunnel arch. There may be a defective insulator either on the roof bolt or on thc bolt which supports the conductor, hut only when two insulators on the same transverse channel frame are defective will leakage occur. The height of the conductors above the level of the top of thc rails is seventeen and one-half fect in the tunnel, and they are fixed a little on each side of the ceuter line. This plan was adopted to avoid the risk of the conductors striking brakemen who might be standing on the top of passing freight cars. An additional precaution is provided in the shape of continuous wooden shields fastened to the iron stirrup which supports the conductors.

Outside the tunnel the height of thc conductors above the rails is increased to twenty-two feet. The supporting structure in the open consists of longitudinal catenaries of two chains of iron rods, having a span of 150 feet suspended from transverse trusses, supported by columns of latticed steel channels erected on either side of the douhle track. The catenaries pass over the top chord of the transverse

trusses and are fastened to a yellow pine timber post, acting as an insulation set therein. From the joints in the catenaries vertical rods are dropped at intervals of fifteen feet to support the electrical conductors. The vertical rods are attached to a casting holding a porcelain insulator, and through this a short bolt passes up to the joint in the catenary. The double insulation is secured by this vitrified porcelain insulator and the timber post, passing vertically through the transverse girder. A hood of galvanized iron is fixed to the top of the timber post. At the ends of the line an anchor pier receives the ends of the conductors. The trusses vary in length from thirty feet to sixty-two feet, the latter being required to span five tracks.

Upon the straight track the conductors are suspended from single catenaries, while upon the curves a double catenary is employed, and the conical insulator is inverted and supported in a casting bolted to the two vertical rods which drop from the catenaries. The vertical rods support a channel frame to which are bolted the conductors and the feeder cleats or clamps.

The feeder cables are of bare stranded copper of sixty-one strands each of 1,000,000 C. M. cross-section. These are supported in iron cleats fastened to channel frames riveted to the overhead conductors at points near to the heavier channels to which the conductors are suspended.

The lead-covered primaries for the tunnel-lighting plant are carried on posts set on the side of the cut, to the southern portal, where they drop to the tunnel and are carried upon porcelain knobs fastened to wooden blocks bolted to the masonry. At the points of support the cables are armored with wire to prevent abrasion. The secondaries are carried in cleats, also fastened to wooden blocks, similarly attached, and placed on either side of the tunnel about eight feet from the ground and fifteen feet apart. They are, however, staggered, and thus occur alternately at every seven and a half feet throughout the tunnel. Each block carries a lamp at its lower end, and is there cut out so that the lamp socket may be protected from moisture and dripping water from the tunnel walls. The lamps are thirty-two-candle power, fifty-two-volt Edison standard incandescent lamps.

The Game Laws.

The many twists and turns in the State game law in reference to the closing and opening dates of the game season have been a puzzle to many sportsmen.

It is a general belief that deer can be killed in any of the counties between July 15 and October 15, excepting in such counties where the Supervisors have shortened the time for the killing of deer to please the wishes of the sportsmen of their respective localities. The State law provides that it shall be unlawful to kill male deer between the 15th day of October and the 15 day of July and repeals all laws or ordinances in conflict therewith, but only such as are in conflict. It will therefore be seen that any ordinance passed by the Boards of Supervisors of the several counties of the State that is not in conflict with the State law is not repealed. It must therefore be remembered that the State law provides that it shall be unlawful to kill deer between October 15 and July 15, not that it shall be lawful to kill between July 15 and October 15. The Supervisors therefore have the authority to say that it shall also be unlawful to kill deer any other time between July 15 and October 15.

The new game law repealed only such acts and parts of acts as were in conflict with it. Section 29½ of the county government act gives the Supervisors power to pass ordinances for the protection of game and fish and that power has not been taken from them any further than to prevent a conflict with the State law.

All ordinances passed by the Supervisors a year ago or since that provide for an open season on deer whose limits are within the three months between the 15th of July and the 15th of October, and have not been repealed by the board, are not in conflict with the general law, and are consequently still in force.

AFTER a series of experiments running through a period of three months at the Boston Navy Yard, the Construction Bureau claims to have at last succeeded in finding a means of rendering the woodwork of the interior of men-of-war fireproof. The sap of the wood is extracted in vacuum in large iron tanks, and the pores are then filled under heavy pressure with a chemical composition of borax, boracic acid and muriate and sulphate of ammonia. Thus treated, it is said the wood may be subjected to flame without taking fire. The color and texture of the wood are unaltered.

A SUBMARINE TELEPHONE CABLE has been in operation between Montevideo and Buenos Ayres, South Ameriea, since 1888. It is thirty-one miles in length and lies at the bottom of the bay separating the Argentine Republic from Uruguay. It is said to perform its functions better than terrestrial telephones in that part of the world.

Sunshine in California.

TO THE EDITOR:—The Weather Bureau makes record of all meteorologic phenomena, among which is the record of the number of hours and minutes each day that the sun shone. This record is made by a photographic process or by an electrical register; each possesses merit, and both give very accurate results. Records of sunshine have been made at San Francisco since April, 1890, and a record has also been made at San Diego. At the other Weather Bureau offices in California no sunshine record has been made. However, as a record of the clear, partly cloudy and cloudy days have been made at all stations in California as elsewhere, the approximate amount of sunshine can be ascertained for all places in California in conjunction with the absolute sunshine record now made. This paper is for the purpose of disseminating such information concerning the record of sunshine in California as the Weather Bureau has so far collated. The rays of the sun are the life-giving properties to all living things. The existence of ourselves, our health, the germination, growth and development of all vegetation is dependent upon sunshine. The presence or absence of sunshine regulates, to a very great degree, the condition of the invalid and controls the actions of the healthy. Especially is the sunshine of value to the people of California in their vineyards and fruit drying. It is true that an excess of sunshine makes a country arid, a deficiency makes a country humid, but favored indeed is the country of a medium between these extremes. The records of San Francisco show that it enjoys on an average 58 per cent of the possible sunshine; that the month of June has the greatest amount of sunshine when the per cent of the possible amount is 70, and that December has the least, with 43 per cent. The amount of sunshine at San Francisco in December, 43 per centum, is, however, 1 per cent more than the average amount of sunshine that occurred in Cleveland, Ohio, during the year of 1893. The average amount of sunshine at San Francisco in the various months of the year, based on the past five years' record, is in per cent of the possible:

January	52.	July	69.
February	52.	August	57.
March	52.	September	61.
April	63.	October	64.
May	50.	November	57.
June	70.	December	43.

The average annual being 58, it is seen that from April to November, inclusive, there is more than the average sunshine, and less than the average from December to March, inclusive. These latter months are practically the months of the rainy season, yet the average sunshine for these rainy months is 50 per cent, and this average is more than the average annual sunshine over the New England and Middle States, and over Kentucky, Ohio, Indiana and the region of the Great Lakes, or more in San Francisco during the period of least sunshine than prevails on an average throughout the year over that portion of the United States where the population is the densest. It should be remembered that San Francisco is on the immediate coast, and that naturally more cloudy or foggy weather will there prevail than at places farther removed, hence a greater amount of sunshine prevails in the interior.

At San Diego there was 68 per cent of the possible sunshine during 1893, according to the figures taken from the latest report of the chief of the Weather Bureau. This report shows that August had 76 per cent of possible sunshine, April and October 75 per cent, July 73 per cent, November 71 per cent, February 70 per cent, September 69 per cent, January, May and December 66 per cent, June 61 per cent and March 56 per cent; or that at San Diego the least amount of sunshine in any month is in March, when 56 of the possible prevails. And this is a larger amount of sunshine than the average annual amount which prevails over all that portion of the United States east of the Mississippi river and north of a line drawn on the latitude of Omaha. On an average throughout the year 80 per cent or more of the possible sunshine prevails at San Diego from 11 A. M. to 5 P. M. At San Francisco from 70 to 78 per cent of the possible sunshine prevails from 11 A. M. to 5 P. M. It is to be regretted that there are no absolute sunshine records at Red Bluff, Sacramento, Fresno and Los Angeles. However, considering the number of clear and partly cloudy days at the various places, the approximate sunshine for each place is obtainable, and hence it can safely be assumed that at Los Angeles the per cent of possible sunshine is 70, at Fresno 66 per cent, at Red Bluff 65 per cent, at Sacramento 60 per cent, and at Keeler 64 per cent. The sunshine at Los Angeles, 70 per cent, is the greatest in the United States save over Arizona, New Mexico, Southern Kansas and contiguous sections, where it amounts to from 74 to 77 per cent of the possible, the greatest amount being at Tucson, where it amounts to 77 per cent.

The following data obtained from the annual report of the chief of the Weather Bureau, for the year 1893, the latest published, may in this connection prove of interest and of value, for it shows the main climatic conditions for the greater portion of California, as well as for the principal portion of the United States. The table is full of interesting deductions, which can be made by the reader.

DATA FOR 1893.

PLACE.	Sunshine per cent.	No. days clear, or partly cloudy.	No. cloudy days.	Total precipitation.	TEMPERATURE. Mean Max.	Mean Min.
San Francisco	60	235	80	17.91	69 1	48 5
Red Bluff	*65	305	60	24 36	71 7	49 5

* Approximated.

B. S. PAGUE, Local Forecast Official.
Weather Bureau, San Francisco, July 20.

Boulder Burst.

In Morris Ravine, near the Goldeu Butterfly miue, there are some gigantie lava boulders weighing from 100 to 400 tons. They are as big as a small dwelling-house and for years have attracted the attention of travelers. On Saturday evening half a dozen or more children were playing beneath one of the largest rocks which stood on an open grassy spot some distance from the mountain.

A few hours later this rock burst asunder and fully 100 tons of the lava were thrown a distanee of thirty-four feet. The part remaining was estimated by Mr. Moody, superintendent of the mine, at 250 tons. There is no theory advanced as to the cause of the bursting of the boulder unless the extreme heat of the day—108°—had affected it.

There are hundreds of other big blocks of lava similar to this in the vicinity, and not one was ever known to break apart before. Had this occurred three hours earlier, some of the children might have been crushed to death.—Oroville, Cal., Register.

For Powder Smoke.

Having been greatly troubled with the vapors arising from continued explosions of giant in driving a tuunel on a southern Utah mining property, one of the pioneer miuing men of that territory has just discovered a very valuable neutralizer for the smoke and noxious fumes which would cling to the tunuel despite the presence of ventilating flues. He called some scieutific knowledge possessed by him into play and as a result now has little or no trouble with the vapors. With an ordiuary fruit tree spray pump the foremen in the tunnel blows lime water into the hanging smoke and gases and the lime neutralizes the latter to such an extent that the tunnel is rapidly cleared and the men may return to their work at the face. The lime water is made by slacking a small quantity of lime iu a bucket of water and of the latter but a small quantity is needed at each spraying.—Butte Inter-Mountain.

THE British Government moves steadily forward in extension of its dominion in Africa. Before the late parliament was dissolved it announced its intention to construct a railway from the eastern coast of Africa to Uganda, and to establish a protectorate over the country to the coast. With the unauimity characteristic of British statesmen in such matters, leaders of all parties readily assented and £30,000 a year are to be devoted to the expenses of the protectorate. The measure was passed by a vote of five to one. The explorer, Henry M. Stanley, who has been elected to the incoming parliament, has been urging this policy of railway construction as necessary for the redemption of Africa from the slave trade. The territory of the British East African Company is now transferred to the Government and all its property passes into direct control of the Crown. The territory extends 400 miles along the coast and reaches inland to the Congo Free State, embracing 1,000,000 square miles. It includes Uganda and the equatorial provinces.

THERE is mueh exeitement in England over the discovery that the Birmingham iron manufacturers have been making idols for the worship of the heathen of India. It is thought to be very wicked. But it is suggested that these iron idols take the plaee of other idols made of gold and silver. These will aecordingly be melted into bullion and coins as money. In that shape the old idols of the heathen will be worshiped actually if not literally by many who call themselves Christians.

From Steam to Electricity.

The Nantasket branch of the New York, New Haven and Hartford road has recently been changed from steam to electricity, and is now operating successfully under the latter power.

That electricity will eventually be the motive power of all great railroads is helieved by many railroad meu, but on the question of whether the time has already come for the great change they are in doubt. It is generally believed that the New York, New Haven and Hartford Company has made the test on one of the least used of its branch lines for a purpose of great importance. The new order of things has worked satisfactorily so far, and the line will be operated in the same way through the winter of '95 and '96. Then, if everything has gone as well as now, it would not surprise many people to see the power of the main line changed to electricity. When one important line has made the change, it is regarded as only a question of short time when all the other great roads will do the same. It will be the old story over again of the trolley supplanting the horse on the street railroads.

Electrical experts disagree on the maximum speed obtainable on the great railroads. Some of them claim that there is practically no limit to it, 300, 400 and 500 miles an hour being within the scope of possibility. Of course, such high speed would uever be utilized. Traveling at the rate of 200 miles an hour the motorman would have to begin to slow down at a point 20 miles before the objective stopping place. Then the possibility of accident would he greatly widened unless the road were fenced in, throughout its entire distance, and equipped with separate tracks for freight, way and express trains.

Already a speed of more than 80 miles an hour has been obtained on the Nantasket road, and the trains can be run as easily at 90 miles as at 80, but the road is comparatively short and hampered hy frequent curves except for a single long run at a point just below Nantasket.

There is little to suggest of the trolley in the construction of the road. In place of the girder, groove, stilt-like "T," or the other styles of rail in electric railways, there is used the conventional "T" rail employed hy steam roads. The rails weigh 75 pounds to the yard, and are of the type known as the "Old Colony section," 4½ inches high and are laid precisely as the rails of steam roads.

Two flexible copper bands seven inches long are under the base of the rails at each joint and riveted to them. The bonds are so placed that when the angle bars used in splicing the rails are in position the bonds cannot be seen. The length of the bond is reduced to a minimum to insure the maximum carrying capacity with a minimum of resistance.

The tracks are fifteen feet apart from center to center, and between the tracks is the single line of poles upon which are supported the cables and trolley wire cross-arms. The poles are 12 to 14 inches at the butt, and 10 to 12 inches at the top. They are painted black to a point six feet from the ground, and white to within one foot of the cross-arm, then finished hlack.

Four motor cars, built after the style of baggage cars, are the electric locomotives. To secure traction they have been made extra heavy, weighing, when fully equipped, about 60,000 pounds each. Two will have four motors each, and the others two motors each hung on trucks.

The cars have all standard appliances of the steam cars. In addition to a 15-inch goug at the front end of the motor cars, each of these cars has a chime whistle, worked with compressed air instead of steam.

Save for a single feature, there is not the slightest resemblance to the steam locomotive. That feature is the cow-catcher at both ends of the motor cars. It is situated underneath the platforms instead of projecting beyond the body of the locomotive, as with the steam locomotive. The wheels are about the size of the largest wheels used on steam cars, but the axles are considerably heavier, to withstand the strain of the electric gearing.

One of the reasons for selecting the Nantasket branch as the line for experiment is that within its short limits are coudensed most of the difficult problems which will have to bc solved before electricity cau be recognized as a successful substitute for steam. The grades are steep and the curves sharp and frequent. Trains are now running at short intervals on the road.

Obituary.

C. A. Luckhardt.

C. A. Luckhardt, metallurgist and assayer, died at his residence in this city last Saturday, aged 61. He was a native of Germany and for more than a generation had made his home here, where be was widely known. He was an honest, liberal-minded man, skilled in his business, and will be remembered by many old-time associates on the coast.

A NEW ORE of thallium, called borandite, has been found in Macedonia, associated with realgar. It is in the form of transparent crystals, varying in color from carmine to kermes red.

The Gold Yield of Europe.

TO THE EDITOR:—In you issue of the 20th inst. you give a tabulated statement of Europe's gold and silver yield in 1894. There is one serious error. Russia's production of $27,646,000 in gold comes almost entirely from her Siberian territory. Gold quartz was first found at Ekaterinburg, in the Urals, in 1745, but the tendency ever since has been for the center of production to move eastward. At the present time the Oural district, covering the Ural mountains, which separate Siberia from European Russia, produces barely one-quarter of the total yield of the Russian Empire and nearly all of this comes from the eastern or Siberian side of the border. The Irkoutsk district, in eastern Siberia, is the most productive. The mines of the Oural, the diggings on the Yenesei, those on the Olekma, have each in turn been the scene of maximum production, and each in turn has given place to some newly found region farther from Europe. Yours faithfully,

T. A. RICKARD,
State Geologist of Colorado.

Denver, Colorado, July 23, '95.

International Geographical Congress.

The Sixth International Congress of Geographers, which is now convened in London, is perhaps the most distinguished gathering of savants ever assembled. Men of world-wide reputation are there as delegates to exchange ideas and compare notes. The importance of the convention may be understood from the fact that the United States Government has decided to have a delegate present.

The list of honorary officials includes the presidents of all the geographical societieties in Europe, Asia and South America. For the United States Chief Justice Daly, American Geographical Society, New York; President George Davidson and Secretary John Partridge, Geographical Society of the Pacific, San Francisco, and Hon. Gardiner G. Hubbard, National Geographic Society, Washington, D. C.

London society will have its representatives in the Dukes of Westminster, Devonshire and Argyll, and others equally well known. Excursions to many points outside the city are arranged for the visitors, and every effort will he made to give them pleasant impressions of English hospitality.

"Value of a Ton of Ore."

TO THE EDITOR:—Replying to "Inquirer" as to small weights used in finding the value of a ton of ore, as set forth in your current issue, I advise adding one grain of silver to the ore before assaying, which will give a good-sized hutton for weighing and handling, and better attract the gold; this extra grain to be deducted when estimating the silver valuation.

Also, to hasten the silver dissolve out of the gold button, flatten it thin with a smooth hammer upon a smooth iron surface before placing in the nitric acid. $\frac{1}{10}$ of $\frac{1}{100}$ of a grain is $\frac{1}{1000}$ and its gold value to the ton of ore from 1 oz. avoirdupois is 1.37\frac{812}{10000}$. $\frac{1}{100}$ of $\frac{1}{100}$ of a grain is $\frac{1}{10000}$; its value to the ton of ore from 1 oz. av. is 13\frac{7812}{10000}$ cents.

Forty-six cents is the value of a ton of ore from $\frac{1}{100}$ of a grain of silver to the avoirdupois ounce, with silver at 69 cents an ounce, and not 60 cents, as by error in last number. A. H. J.

Salt Lake, Utah, Mines.

The following mining report of Salt Lake county, Utah, for 1895, has been prepared hy the Bureau of Statistics:

Mines in Operation in 1894.—Patented 82, not patented 125. Character of product—gold 14; lead, gold and silver 179; gold, silver and copper 14. Number of employees, 433. Total wages paid, $340,253. Output in tons, 39,125; value of output, $442,649. Value of plant, $681,195. Tons of ore concentrated, 17,794. Total value of all development work up to 1895 (partly estimated) $4,507,927.

Mines Not in Operation in 1894.—Patented 87, uot patented 82. Character of product—gold 13; lead, gold and silver 88; gold, silver and copper 23, gold and silver 20, lead and silver 25. Value of plant, $109,725. Total value of all development work up to 1895 (partly estimated) $593.926.

THE arrival at New York a few weeks ago of a steamer from the Argentine Republic with a cargo of 120,000 bushels of flaxseed has brought to light some interesting facts. It seems that quite a trade has been going on in seed from that far-away country for some time past, about 500,000 bushels of the Argentine seed having already been sold here. The flaxseed, although dirty, is reported to he very good in quality, and the price is equal to $1.28 per bushel, duty paid, the latter amounting to twenty cents per bushel. Crushers get a rebate on oil-cake exported, which makes the net price about $1.20 paid for the South American article. American flaxseed is quoted at $1.50 to $1.55, nominally. It is interesting to note that two years ago America exported large quantities of flaxseed; now she is importing.

Coast Industrial Notes.

—"Chicago, Kansas & California" is said to he the name selected for the reorganized Atchison, Topeka & Santa Fe Company.

—The West Shore Railroad Company has incorporated at Redwood, Cal., to build and operate a railroad from San Francisco to Santa Cruz, eighty miles.

—Ten carloads of California fruit left Sacramento last Tuesday consigned to London, England, hy special train, and is expected to he landed there in fourteen days.

—Tbe Oregon Railway & Navigation Company has entered into direct competition with the trans-Pacific lines running out of this port, and has cut the cahin rates to Yokohama to $85 and to Hongkong to $60.

—The directors of the Pacific Iron and Nail Works have concluded to rehuild the plant at Oakland. It has been decided to open the wire works department at once, and this alone will give employment to a large number of men.

—A. B. Hammond promises Astoria, Oregon, railroad connection next year. He says: "The entire road will be completed in 1896, and it is my intention to give to the people first-class service. The line will be constructed on a 16-foot roadbed, with 75-pound steel rails."

—The Northern Pacific Steamship Company announces tbat the flour rate by the steamer Evandale, leaving Tacoma today, will he $2, Mexican, per ton of 2000 pounds, from Tacoma. This is a fifty per cent cut over the former rate. It is only a few weeks since the rate was lowered from $6 to $4.

—As a result of tbe starting of a rock-crushing plant at Folsom the quarries in Alameda county, representing an investment of $500,000 and employing over 500 men, contemplate a shut-down. The owners fear that tbey cannot compete with the Folsom plant, whicb will be operated by convict labor.

—The Selby Smelting Company has made it possible for owners of mines in Shasta county to ship $40 ore at a profit. The company offers to work all ore assaying $50 per ton or less for $14.50 and pay freigbt charges. Heretofore freight charges and cost of working consumed all the profit on ore of that value.

—A syndicate formed recently for the purpose of engaging in the culture of canaigre in the Salt River valley, Arizona, has closed a deal for the purchase of 8000 acres of land near Phœnix. They have entered into a contract for the shipment of one carload per month, and the first shipment will he made about September 1st.

—Coast fir is now shipped in large quantities to the South African mines via Delagoa bay on direct orders, througb London agents, at prices averaging $10 per M., freight varying from 60 to 80 shillings. The superior quality of the lumber for mine timhering and house building bas created a new market for this coast product.

—A company has been organized in this city to develop tbe oil deposits of Guatemala, which are said to be extensive. They have exclusive government privileges, and will put on machinery to develop oil property in tbe vicinity of the city of Guatemala that is said to be able to produce 78 per cent oil that will find ready local sale at a very high price.

—It was Prof. Davidson, recently removed from his place in the Coast and Geodetic Survey, who persuaded James Lick to establish the great telescope that bears his name. The eccentric philanthropist was induced to give up a pet plan for a magnificent pyramid, to rival that of Cheops, only by Davidson's suggestion that a giant telescope would he a far grander monument.

—The East Oakland cotton mills are considering a move to Japan. Tbe company was organized twelve years ago with a $600,000 capital, and has given employment to 300 boys and girls at a time, but the future possibility of having to compete with prison labor and the setback given the industry of twine, rope and ore-bag manufacture gives the works no broadening outlook.

—In the case of the Judson Company against the Giaot Powder Company the Supreme Court has affirmed the decision of the lower ocurt. Three years ago there was a wrecking explosion at the Giant Powder Works and the Judson Company insisted it had suffered to the extent of $80,000 damages. In a suit it got a judgment for $40,000, and this the Supreme Court affirms.

—One of the deepest oil wells in Los Angeles, after considerahle preliminary grunting and grumbling, has started gushing oil at such a rate that it has overrun the neighborhood and is still flowing. The output is estimated to be about 800 barrels per day. Several owners of wells in the vicinity whose properties have been yielding fair returns have decided to stop present operations and dig deeper.

—The New Pedrara Onyx Company, which operated for some time at the onyx mines helow San Quintin, Lower Cal., has reorganized in Chicago with new capital. Plans have heen made for immediate work at the mines. One of the improvements on foot is a motor road from the quarries to the Gulf of California—fifteen miles—where a good harbor exists. Rock will he shipped thence to Guaymas, to he sent to Chicago via the Sonora railroad.

—The first shipment of lithographic stone from Arizona (1000 pounds) was recently made to the Los Angeles Lithographic Co. The quarry from whicb it was taken lies about three miles from Bumble Bee station, and is owned by R. Waldin and Edward Marlowe. The stone has heen subjected to severe tests and pronounced equal to the German stone, which has heretofore enjoyed a monopoly. The commercial value of the stone is about 13 cents per pound.

—The Union Stock Yards Company of Rodeo, Contra Costa county, will he foreclosed hy creditors to secure $250,000 worth of honds, most of which were floated in the East. The company was organized hy A. S. Garrettson of Sioux City, Silberhorn of Chicago, and other wealthy men. Garrettson and Silherhorn were the leading spirits. The value of the real estate of the Company is estimated at $156,500. It is incumhered to the amount of $435,995. The personal property is valued at $13,683. The dehts due, outside of tbe realty incumbrances, amount to $342,768.

—The Oregon Supreme Court has confirmed the sale of the Oregon Pacific railroad to Bonner & Hammond for $100,000. The sale of a property representing expenditures of fifteen millions of dollars in its construction for $100,000 is unfortunate for its creditors. The confirmation of the sale of the road extinguishes the honded indebtedness of $15,000,000 and interest, held in the East, and the $100,000 paid for the road is all there appears to be to satisfy the indebtedness of over $1,000,000 incurred hy the receiver since his appointment in 1890. The court tried to realize the expenses of the management of the property from the sale, hoping the bondholders would, hy reorganization, buy the property and pay off the expenses of the receiver's management, and fixed the minimum price at $1,000,000. and at another time $1,250,000, hut was unahle to effect a sale. The only remedy remaining was to sell the property for what it would hring, which, having been done, the sale was confirmed by a court that was acquainted with the property and must have known its value. The purchase is said to he hona fide, and it is said that John Claflin of H. B. Claflin & Co., New York, is behind the deal. Everytbing connected with the railroad, from beginning to end, bas been so muddled that no one outside of the lawyers in the case has any definite understanding of its affairs.

Mechanical Progress.

Standard of Horse Power.

Although the American Society of Mechanical Engineers has adopted a standard of boiler H. P., the old nominal H. P. based upon the amount of heating surface, is still very largely used, and whenever the word H. P. is used in connection with boilers, the matter must first be settled just what rating is meant. The American standard adopted was the evaporation of 34½ pounds from 212° to steam at 70 pounds. Some men rate their boilers on a heat-surface of 15 and some 12 square feet to a H. P. This fact is clear, that the boiler H. P. bears no resemblance to the engine H. P. The boiler that will just do for a simple Corliss engine would be equal to supplying twice as much H. P. to a triple-expansion engine, and would probably be too small to supply that power to a common slide-valve engine. This must be considered.

As the method of rating boiler power by heating surface is still so largely used it is a matter of some interest to note just how this method of rating compares with the standard rating by evaporation. Take a common tubular boiler rated by heating surface at 15 square feet per H. P. Will this H. P. rating be greater or less than the boiler will actually do by the evaporation standard? The assumption of 15 square feet as the basis makes the boiler have less nominal H. P. than if 12 feet had been assumed as the standard. This should be considered. When these ratings were made they were at the time when boilers were not so economical as now. The engine that used the steam required very nearly 45 to 50 pounds of steam per H. P per hour, and the boiler that would produce a certain H. P. in these engines was ascertained by direct use. The performance of the average tubular boilers varied little then, as it varies little now, and a certain boiler found capable to provide steam for the engine of a certain power at that time was designated as being a certain H. P. of a boiler, to correspond. Taking this as a basis the heating surface was divided by the H. P., and the quotient gave the heating surface of this type of boiler per H. P., and the rating was perfectly satisfactory, since if reversed the proper heating surface for that power of engine could be again found the conditions remaining practically the same.

As the economy of engines increased it was evidently observed that a boiler calculated upon this basis was underloaded and capable of more than supplying the new engine of the same power as the less economical one, and which previously the boiler had just fitted. This led to a revision of the rule as judged from the most recent practice, and the heating surface was again divided by the power the boiler could furnish steam for in the new engine, and the quotient gave a new rating of twelve square feet of surface to the H. P. Now it would be possible to carry this idea still further and involve another rule for the very economical engines of to day, and the rule might become six square feet to the particular engine power the boiler was supplying. The American Society standard settles this matter, but the old ratings are just as true and applicable to the type of engines that gave the original rating from which the rule was obtained. The 15-foot rule we believe to apply to the common throttling slide-valve engine, and the 12-foot rule to engines of a more economical type but not coming so low as a simple Corliss engine. Our experience in this matter has been this, that with horizontal tubular boilers, and no others are considered in this discussion, burning bituminous coal with a fair rate of combustion, that the actual H. P. by evaporation will be found somewhat in excess of the 12-foot rating. That is, a tubular boiler rated at 80 nominal H. P. could safely be depended upon to give 100 H. P. of the American Society standard, burning soft coal, without undue forcing, though running with open damper. If the rating is upon 15 feet, the H. P. actually obtained by evaporation will be considerably greater. Our experience with hard coal shows the 12-foot rating to be quite near to the evaporation standard, the power of the boiler under similar circumstances being reduced by the using of the harder fuel. With these assumptions it is quite possible to still use the old rules and estimate the value of the boiler, and how much engine power it will provide, when the economy of the engine is known approximately.

Cut and Wire Nails Compared.

At a recent meeting of the American Society of Mechanical Engineers in Detroit last month, a paper was read by R. C. Carpenter, recounting some tests made with cut and wire nails to to ascertain their relative efficiency. Comparison was made between the two classes with six-penny, eight-penny, ten-penny, and twenty-penny sizes. Enough of each kind to make a pound were driven into yellow pine of uniform quality, to within a quarter of an inch of their full length, and proper mechanism was attached to measure up the total force required in driving each class. Similar data were obtained regarding the operation of starting the nails and then pulling them. The result was that the cut nails were much harder to drive, and harder to start when drawn than the wire nails, but the latter, once started, were harder to pull out, and hence are ranked by Professor Carpenter as the more efficient nail. Why he should ignore the greater difficulty in starting the cut nails, though, is not quite clear; since in any structure put together with nails this is an important element of strength. In the same series of experiments it was observed, what almost every one must have noticed who has used the two kinds, that the cut nails in going in broke the fibers of the wood, whereas the wire nails, being pointed, merely separated them. Hence the elasticity of the wood remained greater in the latter case. As the cut nail had a greater surface than the wire nail, the former stuck tighter in starting, but after that the wood would press in against the metal during the rest of the pull, more firmly in the case of the wire nail than with the cut nail. This is the philosophy of the latter's inferiority when once loosened. Some experiments were made with carefully sharpened cut nails, and these showed a superiority over the ordinary blunt cut nail, both in starting and pulling. A sharp-pointed cut nail, then, would appear to be the best of all styles, except that there are not so many of them to the pound as there are of wire nails.

To Insure Tight Joints in Pipes.

In a great variety of industries it is desirable to transmit fluids of some kind (steam, compressed air, illuminating gas, freezing mixtures, or oil, for instance) under very high pressure. Unless the pipes which convey these gases or liquids be connected with one another very snugly, there will be a leakage at the joints. This means more than mere waste; it affects the efficiency of the plant, and may lead to corrosion and impairment of strength. A method of rendering joints tight, invented by A. J. Rossi, is simple and effective.

On the inner surface of the overlapping part of the joint, where the screw-thread is, he makes a groove, going entirely around, with a width of a quarter of an inch and a depth of about one-sixteenth. This recess is filled with a collar of lead. One or more holes are bored in from the outside and screws placed so that when they are turned they will squeeze the lead and force it to flow into any crevices between the underlying screw-threads. Any ordinary leak can be stopped effectively and quickly in this way. In most of the many tests made, bad leaks intentionally made were overcome in the face of 250 pounds or 300 pounds steam, 1,500 and 1,700 of air, 1,800 to 3,000 pounds of hydraulic pressure, and also of petroleum. In one of the experiments with oil the pressure was carried up to 12,700, and with water to 16,000 pounds to the square inch! A leak in an ammonia pipe was stopped so thoroughly that the most delicate tests with phenolphtalein paper failed to reveal any of the vapor outside the joint.

It might happen, from repeated tightenings of the screws, that they would get in as far as they could go. If a leak developed after this, it would be necessary only to remove a screw or two entirely for an instant and drop in small pieces of lead of the right size, to render the device as efficient as ever.

Scientific Progress.

Compressed Air in the Machine Shop.

One of several applications of compressed air in the handling or conveying of the different kinds of oil used about any establishment. Tanks for engine oil, lard oil, cylinder oil and lubricating oil are buried in the ground, convenient to the track where the oil is unloaded by running it into these tanks. The oil is forced to wherever it may be wanted, and compressed air delivers it there. By having the lubricating oil and the lard oil faucets in the tool room, each workman is supplied with his oil just as he is with any other tool, subject to an order from his foreman, and the splash and waste of high-priced lard oil is reduced to a minimum.

Did the reader ever have to fill his oilcan from a barrel of lard oil in the winter time, in a room with a temperature somewhere between the freezing point and zero? This operation always suggests the picture of a barrel with one head broken in, and a splinter of wood as a spoon, used for conveying the stiff lard oil into an oilcan through an orifice about one-quarter inch in diameter. Usually, while a small chunk goes into the oilcan, a large one drops on the floor, and the smear and waste is enormous. The compressed air arrangement not only abolishes this waste, but, by reason of the tank being buried in the ground below frost, the lard oil is kept liquid at all times. Moreover, this arrangement has the additional advantage of reducing the fire risk, and thereby lessening insurance rates, besides adding to the general neatness and systematic working of the establishment in no small manner.—C. O. Heggem in Cassier's Magazine for August.

Industries and Iron describes the new method of lining basic open-hearth furnaces recently introduced. Mixed with the usual basic materials, in a dry state, is mineral pitch, bitumen, or other solid mineral or vegetable fusible hydrocarbon, so that the compound does not become plastic, but remains in a powdered condition. In lining a furnace the latter is first heated to a high temperature, and the mixture of powdered basic material and pitch is then thrown into the furnace so as to be deposited where required. The pitch is immediately set on fire by the heat of the furnace, and serves to retain the mass of basic material in the spot to which it was directed when thrown into the furnace, whether the spot be on the bottom or walls of the furnace, the throwing-in of the mixture being continued until the hearth has taken the desired shape and size. The heat of the furnace burns away all of the carbonaceous residue of the pitch, and the basic material is glazed or burned on in a solid mass, so that the furnace is provided with a substantially pure basic lining. The basic material which the inventor prefers to use is the previously burnt dolomite, and the pitch is the ordinary mineral pitch of commerce. The basic material and the pitch can be ground together so as to become intimately mixed, or they may be ground separately and afterward mixed by sprinkling the desired percentage of powdered pitch among the basic material. The percentage of pitch may vary according to circumstances. Ordinarily from five to ten per cent will be sufficient.

Building a Steam Engine Fifty Years Ago.

First, a large drawing board was prepared, large enough to make a plan and side elevation, full size. Engines all being made very long stroke, the drawing boards were quite large, an engine of 14 inches diameter, 48 inches stroke, taking a board about 6x20 feet. The engine was plotted down, lines chalked and leaded; patterns were then made to correspond to the drawings, castings were made and fitted, but connecting rod, piston rod, valve rods, etc., were left till the cylinder guides and pillow-block were fitted on the bed plate. Measurements were then taken for the different rods, and the rods made the proper length to fit. No two engines were exactly alike; variations in shrinkage and fitting were adjusted in the length of the rods. Generally, after the first engine was made, the drawings were planed out, so that the drawing board could be used for another size. This destroyed the record of sizes; but as all rods were measured for each particular engine, this did not interrupt the work of construction. I need not refer to the present methods in this line, as you are all familiar with them. To-day almost every part of an engine or other machine could be made in different shops, widely separated, and then assembled into a complete machine without a hitch. This would have been impossible under the old plan. Taking all the disadvantages into consideration, the wonder is that the mechanics of fifty years ago could turn out as good machines as they did.—Robert Allison in Cassier's Magazine for August.

THE Royal Society of Belgium has published some additional facts in regard to the heretofore referred to process of welding of metallic bodies by means of simple pressure at temperatures far below their fusing point. In these researches the plan pursued was to put the metals in the shape of cylinders bounded by plain surfaces, great care being also taken as to their purity, and, having been mounted and welded together by means of a hand-screw, they were placed in a heating oven and kept at a constant temperature between 200 and 400 degrees for from three to twelve hours. The result, as detailed, shows that the most perfect joints were produced with gold, lead and tin, while the worst were with bismuth and antimony; two cylinders thus welded together could be put in a lathe, one of them only being held in the chuck, while the other was being worked upon by a cutting tool, without coming apart. They could be separated with the aid of pincers, but then a rough breakage was produced which did not coincide with the original plane of separation. It appeared, too, that the more crystalline the bodies the less is this phenomenon of incipient liquefaction exhibited, the commencement of its appearance in the case of platinum, for instance, being 1600 degrees below its fusing point—that such a liquefaction or softening actually took place being abundantly proved by experiment.

TO PREVENT the formation of scale in steam generators, A. Nieske, of Dresden, recommends the addition of chromic salts to the feedwater. The lime existing in the latter in the state of bicarbonate of sulphate is precipitated by such salts in the form of a non-adhesive light mud. Bichromate of potash may be used in the proportion of two pounds for a small boiler; but an excess of the salt would be attended with no inconvenience.

Electrical Progress.

The Electric Furnace.

One of the most beautiful processes in modern metallurgy is the melting of certain metals in the electric furnace, and it is now possible to project upon a screeu every phase of such an operation. Some idea of the wouderful play of colored light, which thus becomes so toned down as to be tolerable to the naked eye, may be formed by a description given lately by Professor Roberts-Austen of the projection of an electric furnace during the melting of metallic chromium. As the current is turued on, the interior of the furuace appears as a dark crater, the dull red poles revealing the metallic luster and gray shadows of the metal beneath them. Soou these poles are tipped with dazzling white, aud in the course of a few minutes the temperature has risen to about 2500° C. A lambent halo of green-blue now encircles each pole, the central band of the arc chauging rapidly from peach blossom to lavender and purple. As it becomes necessary to lengthen the arc, and the poles are drawn further and further asunder, the irregular masses of chromium fuse in silver droplets in the midst of light changiug from intense blue to green of lustrous emerald. Then the last fragments of chromium dissolve into a shining sheet, which reflects the glowing poles in green and gold shot with orange hues.

Professor Roberts-Austen adds: "Still, a few minutes later, as the chromium burns, a shower of brilliant sparks of metal are projected from the furnace amid the clouds of russet of brown vapors which wreath the little crater, while if the current is broken, and the light dies out, you wish that Turner had painted the limpid tints, and that Ruskin might describe their loveliness. The effect when either tungsten or silver replaces chromium is much the same; but in the latter case the glowing lake is more brilliant in its turbulent boiling, and blue vapors rise to be condensed in iridescent beads of distilled silver which stud the crater wall."

JAS. HOULAHAN has attracted some attention by his alleged discovery of a uew law in magnetism, wherein he claims that, by the use of an armature opposed to the magnet, non-magnetic metals—such as gold, silver, copper, lead, mercury, bismuth and others—will be attracted. The armature stated to be required is merely a plain piece of iron, such as the keeper of au ordinary horseshoe magnet. A feature claimed for the ore separator in which this idea is stated to have been embodied is that when gold and silver are found in the ore as sulphides or chlorides, passing them between the magnet and armature, it is alleged to liberate the sulphur and chlorine and to leave the pure metal adhering to the magnet. Whether this is caused by an electrolytic action or by the heat generated from revolving a powerful magnet in front of an iron plate is not known. The inventor's theory is that a static discharge takes place between the magnet and the opposed armature, which would probably make the action similar to that which takes place in electroplatiug. The difficulty seems to have been to keep magnets from setting up an arc between the pole pieces and the armature, which gave a heat great enough to cause fusion. This arc Mr. Houlahan says he obtaiued early in his investigations, aud it was ouly by taking off windings and a laborious system of experiments that the right point was reached. So far the discoverer or inventor's ideas have not attained much further endorsement than that accorded the multitude of new process meu.

CONSIDERABLE interest is manifested in the new telephone company's wire between Sacramento and Folsom, which is carried on the same poles as the wires over which the power is transmitted to the Capital City. Contrary to supposition, the telephone wire works satisfactorily, though the induction is so great in the case of the old company's telephone wire which runs parallel with the new line as to make the former practically useless. The new lines are not grounded, but operated by the transposition system.

A SMALL ELECTRIC LAMP is being used instead of a bell in several telephone exchauges. The call for connection lights the lamp.

SOME ONE has put a volume into a line by sayiug that "the brake is the best trolley car fender."

Practical Information.

New Wind Engines for Pumping.

A crude invention called the "Jumbo" wind engine is now coming into extensive use in western Kansas. Its ease of construction, economy in cost, capacity in power and simplicity, seem to recommend it to those who observe its work. It resembles the paddle wheel of a stern-wheel boat, with a shaft twelve to fourteen feet long, is twelve to sixteen feet across, with six or eight arms. The lower half of this wheel is shielded from the wind, so that the air acts only upon the upper vanes. A crank upon one end of the shaft counects with a pump. Its power can be indefinitely increased at any time by increasing its length, which can be done by any one who is handy with tools. It is said that a "Jumbo" giving 100 H. P. in fifteen-mile wiud can be put up at a cost of $500. The wind acts upon this sort of paddle wheel from all points of the compass except two. It seems to require no "goveruor," but simply pumps more during a storm. No tower is required, and it is placed so that the radial arms will be clear of the ground. In fact, in Kausas, where there are few trees and no hills, it is claimed that the wind currents have greater force at the surface than high in the air. One of these wind wheels now running in Kansas is 21 feet in diameter, 27 feet long, with eight fans. The largest water wheel in the world is an overshot wheel in the Isle of Man, recently illustrated and described in these columns, is 72 feet 6 inches in diameter, 6 feet in breadth, with a crank stroke of 10 feet. It gives 200 H. P. There may be many wind-power Ferris wheels in the States of the plains, bringing fertility where is aridity.

Perhaps in this crude device for raising water for irrigation in a wind-swept country there is the germ of an idea which, when fully developed and perfected, may become widely useful. If so, it will be quickly improved, for it is watched by many eager and anxious eyes, and now the development of an implement requires days where formerly centuries were needed. The crude "Jumbo" of to-day may become the perfected irrigating machine of to-morrow in level and treeless sections of country.

Bullets for the Navy Rifle.

As the result of exhaustive experiments in actual firing the Ordnance Bureau of the navy has determiued to reduce the weight and length of the ball for the new naval rifle from 185 grains to 112 grains. The firing tests have shown conclusively that the lighter ball is much more accurate than the present ball, and certain other advantages will be realized by the change.

It has put the ordnance officers to some trouble to reach a theory that will satisfactorily account for the paradoxical fact that a light ball is more accurate thau a heavy one, but they have done this by patient investigation. The idea is that the heavy shell, composed of a thin shell of plated steel eclosing the solder, by its inertia offers so much resistance to the sudden starting blow of the powder that it is what is technically known as "up-set" or shortened, and somewhat deformed before it leaves the barrel.

This deformation from a true cylindrical form is considered sufficient to account for an eccentricity of flight. It is quite certain that the lighter ball is truer in flight, for in the experiments with it at the proving ground, shooting at a target distant 1500 yards, five consecutive shots were placed in an 18-inch circle, and at 500 yards the same number of shots were lodged in a one-foot circle—a degree of accuracy that is far beyond that achieved with any other ball in a service weapon.

Besides lightening the ball, it is probable that the steel envelope will be made thicker, so that it will be less likely to mushroom upon striking a mark—a change that appears to be desirable in view of the trials of the army rifle. The light ball loses something in dropping after passing the 1000-yard mark, but within this range it actually goes straighter than the heavy ball in a vertical line, and by the aid of screens interposed at measured intervals between the gun and the target, it is found that at 500 yards the ball may be fired point-blank, or without raising the sight.

The Ordnance Bureau has also determined finally to make the barrel of the new rifle of nickel steel, which will be a distinct step in advance for the United States in gun-making. The barrels composed of this alloy, which have been shot thousands of times, show almost no wear or depreciation, and owing to the smoothness of the alloy in working it is believed that the barrels can be bored and rifled with great accuracy and ease.

As soon as the contract for the American rights to this new rifle are closed with Mr. Lee, the inventor, the Department will address letters to the big gun-makers of the country, inviting them to submit bids for the number required for the navy. It is expected that all of the sailors can be armed with the small-bore in the course of a year.

Deposits in Kitchen Boilers.

The deposits from water may be troublesome in many places, and most people are at a loss to understand how they occur. As explained by *Ironmongry*, all cold water absorbs carbonic acid gas from the air, of which the atmosphere always contains a small percentage. When water thus charged with carbonic acid ruus over lime or magnesia, or filters through earth containing these materials, it dissolves portions of them. When heated, the carbonic acid is driven off from the water, and as it is only by virtue of the presence of this acid that water can dissolve carbonates of lime or magnesia, these then resume the solid state, and, adheriug to metallic surfaces, form a scale almost precisely as tartar forms upon neglected teeth. It follows that if water be first heated before being fed to boilers, or if by chemical means the carbonic acid can be expelled, and time for the precipitatiou of earthy matters be allowed, the water will not thereafter form a mineral scale. While feed-water heating is practicable for power boilers, it is not usually so for kitchen boilers or for heating boilers. In places where only a hard water supply is available, it is better to use such form of boilers for each of the purposes as will admit of their interiors being easily cleaned. Some waters contain vegetable matter which forms a scale, or which, at least, mingles with the mineral scale. The latter is normally white, or nearly so. If it be mixed with matter of vegetable origin, it may have a dark color, often resembling chocolate.

NOTHING that has come to the front in late years has had more nonsense written and talked about than aluminum. Aluminum is a nice metal indeed, and has its uses, but when it is said it will supersede steel for structural purposes, that is saying too much. As compared with steel the tensile strength of aluminum is about one-third as great, and as it is, bulk for bulk, about one-third as heavy as steel, it follows that for equal strength the bulk of aluminum must be three times as great as that of steel. In other words, the weight of aluminum must be equal to that of steel in order that the tensile strength may be equal, so that for structural work, such, for instance, as bridges, it does not appear to have any place on account of lightness and would not, even at the same price as steel, come into use for such a purpose as bridge building, especially since it is weak under comparison, lacks rigidity and its elastic limit appears to be a variable and uncertain quantity. Some of its good qualities are its ductibility and its non-corrosibility under ordinary conditions. Should it come about that aluminum is produced at the same price as steel it will never to any noticeable extent rival the latter, but beyond doubt for certain purposes its use would be largely extended. As before said, it has its uses, but its value is not enhanced by writing and talking nonsense about it. In fact, its use is only retarded by such writing and talking, as men are induced to use it for purposes for which it is unsuited, the result being a prejudice against it for any purpose.

A Man of Titles.

"Giving the devil his due" is no light undertaking in Turkey. Whenever the name of the Sultan is mentioned, it must be after the manner of the following, which is literally translated from a Turkish paper:

To-day our paper reaches the thirteenth year of its existence; and we celebrate this anniversary in the reign of the finest pearl of the age, and the esteemed center of the universe; at whose grand portal stand the camels of justice and mercy, and to whom the eyes of the kings and the people in the West have been drawn; the rulers there finding an example of political prowess, and the classes a model of mercy and kindness; it is our Lord and Master, the Sultan of the two Shores and the High King (Khakan) of the two Seas; the crown of ages, and the pride of all countries, the greatest of all Khalifs; the shadow of God on earth; the successor of the Apostle of the Lord of the Universe, the Victorious Conqueror (Al-Ghiz) Sultan Abdul Hamid Kahn; may God protect his kingdom and place his glory above the Sun and Moon, and may the Lord supply all the world with the goodness which proceeds from His Holy Majesty's good intentions."

WANTED!

To Rent or Buy

A DIAMOND PROSPECTING CORE DRILL

FOR UNDERGROUND WORK.

Complete, in working order. To be run by compressed air and drill from 300 to 1000 feet. Give terms or spot cash price, and all particulars at once. "The Sullivan" preferred.

BOX NO. 23, CRESCENT MILLS, PLUMAS COUNTY, CALIFORNIA.

RUPTURE CURED!

NO DANGER. NO OPERATION. NO PAIN.
No Detention from Business.
QUICKLY! PERFECTLY! PERMANENTLY!

NO PAY UNTIL CURED.

J. C. ANTHONY, M. D.,
San Francisco Offices, Suite 86 and 87, Chronicle Building.

THE GOLD BUG MINING COMPANY,
Owning rich mining bars and islands on Snake river, Idaho, and controlling valuable patented pump and gold saving machinery,

WANTS COMPETENT MAN,
To superintend working crews on mining boats financially able to invest $2000 if satisfactory after investigation. GOLD BUG MINING CO 94 Sixth St., Portland, Or.

Mining Summary.

CALIFORNIA.

Butte.

AN EXTENSIVE SCHEME. — The Golden Feather mine, comprising about a mile of Feather river bed near Oroville, will soon be worked out. In the opinion of Major McLaughlin, the manager of the company, it is advisable to generate electricity with the large water power at his command at the mine. The canal which was constructed to lay bare the bed of Feather river has a capacity of 200,000 inches of water, and Major McLaughlin believes there is an available force of about 5000-horse power for the generation of electricity. He talks of spending $50,000 in experimenting, and an electric road may be built into the mountain lumber camps and power be furnished to distant points.

Kern.

AMALIE DISTRICT.—A. Sauser has sold to Mr. McKnight the David mining claim for $1000. H gh Mann sold the old Tehachapi mill to Mr. McKnight, and it will be put up on the David immediately.

Mr. Mead, of Los Angeles, has bought the Brogan and commenced work. The Brogan is a free gold proposition, although the rock is not of a remarkably high grade. The lead is very large.

J. B. Ferris has bought the Caliente mine of Mr. McKay, and expects to put a crew of men to work on it immediately. Mr. Ferris also sold an interest in the Lime Kiln lead to San Francisco parties, and work will shortly be pushed on that.

J. Miller has sold a half interest in the Berry mine to some Los Angeles and Bakersfield parties, and they have men at work.

The Occidental mine has been bonded to Los Angeles and Nevada City men; consideration, $30,000.

The Amalie Co. are putting in a raise over winze No. 2 to surface, where they expect to put up a permanent hoist. They already have one hoist in operation at tunnel No. 2, winze No. 3, and are taking out large quantities of shipping and milling ore at that point. The new hoist is being put in order. They expect to continue sinking at this place, where they have already attained a depth of 250 feet.

G. E. F.

AROUND GOLER. — *Democrat:* At Mesa Springs a dozen men are at work getting gold. Summit Camp has only twelve men at work now.

Swartout, Kuffel & Harrison have a shaft fifty-two feet to bedrock and are drifting. They work five men dry-washing and take out about $100 per day.

At Red Rock S. James has leased the Bonanza Company's property. He employs sixty men running three dry-washers, and is getting considerable gold.

At Last Chance J. D. Richardson has, at 90 feet, struck an old river channel that promises to be very rich. He has two drifts, each 300 feet long. The gravel prospects from surface to bottom of shaft, but only two feet next to bedrock is being worked. About a dozen men are at work in Last Chance gulch.

Lassen.

DIAMOND MOUNTAIN.—Lassen *Mail:* Messrs. Goodwin, Shinn and Cain, who are interested in a mine at Diamond Mountain, have recently struck rock which promises well. A conservative estimate of the value of the find is $20 a ton. The mining boom in that vicinity a few years ago demonstrated beyond a doubt that a limitless quantity of gold-bearing quartz could be had, and on that occasion the cause of failure can be attributed to an absence of knowledge of reducing the ore and the incomplete milling machinery.

There is said to be an exhaustless body of ore at Diamond Mountain—several ledges have been opened which assay from $5 to $10 a ton. With modern machinery and processes for saving gold, under favorable circumstances—such as exist at Diamond Mountain, where wood and water, two essential factors, are close at hand—the actual cost of mining and milling quartz rock, if not too rebellious, does not exceed $2 a ton. If such be the case, what a bonanza awaits the enterprising individual or company who controls a quartz ledge and erects machinery for reducing it at Diamond Mountain!

Los Angeles.

AT ACTON.—R. E. Hudson has bought the old Tejunga mill and will remodel it. The Mount Miesa Company, which started its tunnel about 200 feet below the upper tunnel, have made a good strike.

Mono.

NEW CYANIDE PLANT. — *Miner:* The new cyanide plant on the Silver Hill mill site will consist of six tanks, twenty feet in diameter, with a capacity of about seventy tons each, two solution tanks and two sump tanks—ten in all. It is expected that the plant will have an average capacity of 150 tons a day. This will be the fourth and largest of the tailings plants around Bodie.

Nevada.

AFTER TWENTY YEARS.—'Tis twenty years since work was discontinued on the Bullion Consolidated group of mines—the Bullion, Ione and Galena—but the renaissance of California's mining industry includes the reopening of many mines so long idle as to be forgotten. Over a hundred thousand dollars was taken from those mines in days gone by. Geo. Mainhart, who continues as superintendent of the Omaha and Lone Jack, will oversee operations which begin this week.

SOLD FOR $25,000.—The Bryan ranch, east of Grass Valley, has been bought by the representative of an English syndicate for $25,000. It contains valuable mining ground, and is also favorably situated for reservoir sites.

A NEW PIPE LINE.—Work has begun on the new pipe line of the North Star Mining Company, which is to convey water from the South Yuba Company's ditch to Massachusetts Hill, where it will be utilized in running the large compressed air plant that the company intends establishing there and which will furnish power to drive their mining and milling machinery.

TO BE BUILT.—The plant of the North Star Company, where power will be generated for working the Massachusetts Hill claims, will be in a building 36 feet high, 108 feet long, to be erected at once.

Plumas.

THE PLUMAS IMPERIAL.—A limited amount of work recently done on the Plumas Imperial gravel mine at Hungarian Hill has so fully demonstrated the richness of the ground that the owner, Mr. Hazzard, intends thoroughly to equip the property at all points for the coming season. The old flumes are to be replaced with new ones, laid with increased grade. This will enable the same quantity of water to accomplish more than with the present low grade. The improvements contemplated by Mr. Hazzard, taken in connection with the excellent water supply, unexceptionable restraining dam and all necessary mining appliances in place on the mine, should by good management restore Hungarian Hill to the high place it held as a mining locality previous to the closing of the hydraulic mines of Plumas.

Riverside.

THE GOOD HOPE.—At the Good Hope twenty men are employed at the mine and mill. The latter is being run part of the time and enough ore is being put through to pay running expenses.

THE BRIGGS MINE.—Eight men are employed at the Briggs mine. The new shaft is down 100 feet and a nine-foot ledge has been opened up. The ore is better than any ever before found in the mine.

On the Glory mine, the second extension northwest of the Briggs, a shaft thirty-three feet deep has been sunk, and a three-foot ledge developed. Water has been struck and a pump will have to be put in.

San Bernardino.

TAILINGS TO BE WORKED.—A trial lot of 100 carloads of tailings from the mines tributary to Victor are to be brought into San Bernardino and worked. If the venture proves successful on the first hundred carloads it will result in the establishment being increased in size.

San Diego.

JULIAN AND BANNER.—*Sun:* A. P. Frary, who has been working the Hidden Treasure mine in the Julian district, brought in $7000 in Bullion, taken from 8½ tons of ore. This mine has been abandoned three or four times by different parties, but the present owners seem to have found some good rock. They are working about 200 men below the surface, and on a new chute of ore. Frary reports a big revival in mining interests in the Julian and Banner districts. The *Sun* says the records show nearly $6,000,000 in gold taken out of the Julian district alone from the beginning to the present time.

Sierra.

LARGE GOLD SHIPMENTS.—*Messenger:* Shipments of gold bullion from this part of the county have been unusually heavy during the past few weeks. Fully $25,000, taken from mines in the vicinity of Downieville, has been sent below since July 1st. The gold yield throughout the county this summer is far in excess of that of last year, and indications point to the conclusion that these favorable conditions will continue to prevail.

Siskiyou.

RENEWED ACTIVITY.—*Journal:* The Steamboat mine, at McAdams creek, is to be reopened by A. C. Brokaw and Nelson Bennett, of Tacoma, who intend constructing a bedrock drain 2¼ miles long for draining it and working the broad channel above Fort Jones. Powerful steam pumps are to be used in keeping the water out until the drain is completed, for which purpose a 75-horse power boiler, with two 12-inch pumps and hoisting machinery, will be used. The work will be commenced at the Live Yankee shaft, which will be enlarged and operated with steam hoisting apparatus. There will be three compartments and two cages, and day and night shifts will be employed constantly to keep the water out and prospect at the same time. This claim has always been noted as one of the best paying mines in Siskiyou—in fact the entire creek, all the way southward from its source, including the head tributaries of Deadwood and Cherry creeks on the divide between Yreka and Fort Jones, has yielded handsomely when worked. The only difficulty in working the lower end of McAdams creek is the great surplus of water to handle, which a bedrock drain will carry off successfully. The opening of this claim will give employment to a large number of men and put much gold in circulation, making lively times at Fort Jones and vicinity.

Tuolumne.

GENERAL NOTES.—"Argus" in *Independent:* The Mammoth, an English Co., at Jacksonville, employs about thirty men. Two tunnels are being entered from Wood's creek, and from which water has been brought a distance in ditches and flumes. A twenty-stamp mill is about to be erected. The grading out is being proceeded with.

Work is being carried out on the Eagle and Shawmut. The Homestake are working six men.

The Jumper, with a ten-stamp mill, is in full force. At the New Era the owners are developing. The Golden Rule is taking out very rich ore. They are shaft sinking with a full force of men; orushing with their ten-stamp mill. The Miller & Holmes, and a group of mines belonging to the Napa Quicksilver Co., are all in full working force. This company are putting in a full and complete electric power plant, to drive the necessary machinery for the whole group of mines owned by them.

The App, Quartz Mountain, is developed 800 feet deep, at which level, exceedingly rich ore has been struck; vein matter of large dimensions.

Next, the Dutch mine, is in active operation. They have five distinct ore bodies. This property looks remarkably well. A new five-stamp prospect mill will start up crushing this week, to determine value of ore shoots.

The Gem mine, still further north, is running their ten-stamp mill on large ore body, profitably.

The Crystalline group of mines are prospecting with a small force of men, showing value in several places, and mill of fifteen-stamps at work.

The celebrated Rawhide is taking out unusually rich ore, even for this mine, rich rock being the rule, rather than the exception. The last find is from the 700 foot level. The regular clean-ups, from this mine, are immense. This mine was abandoned, and laid idle for many years, and was purchased by Mr. Nevills, on its past record only.

In the next mine, the Rappahannock, the shaft is now down 350 feet, with excellent prospects. When the owner, Mr. Chute, crosscuts to the east, and intersects the black slate belt, another paying mine will be added to Tuolumne's list of gold producers. Last week a rich vein was discovered, on the surface, to the west, showing gold, and assaying about $30 to the ton.

At the Darrow mine, owned by Johnny Witney, very rich rock was discovered; value as high as $15 to the pound; formation, black metallic slate. He expects soon to put up a small mill. There are a number of other mines working to the north and west, including the Pena Blanco; the latter have twelve men employed, keeping mill running continuously on good rock. Large works will be placed on this property, in the near future, now being prospected by Hayward & Lane.

The Golden Gate, one mile from Sonora, is turning out its regular monthly shipment of bullion. This is a good property—needs a second shaft and increased mill and chlorination capacity; then their output would be very largely increased, with little extra cost.

IN THE COPPER BELT.—The Dead Horse, or Old Eureka, has struck a 22-foot ore body at the 1400-foot level, showing free gold in great richness, and sulphurets of high grade. This was an old abandoned mine, or rather the Eureka was, which is now an integral part of the same mine. Owners, Messrs. Hayward & Hobart estate. Their twenty-stamp mill is running day and night.

The Seminole group, all old abandoned mines, are being re-opened. The rock found is of high grade, and is turning out most profitably. Their mill is running continuously, and the shipment of bullion, monthly, is quite large. The resident manager, Col. Coles, is highly elated at his present and future prospects. This is a New York Co.

The Louisana, an old abandoned mine, is being re-timbered and pumped out. So far as unwatered, rich ore is visible, and plenty of it. The prospects for a valuable property are assured.

The Laura & North Star is sunk some 400 feet. Steam hoist; shows well. The old Eston mine is taking out rich rock. The Cullers, a parallel, shows rich ore. The North Fork is steadily working, with very good prospects.

The Old Soulsby has re-started, sinking new shaft. This mine in the early days produced millions, sunk to a depth of 800 feet. This old mine will again be a steady gold producer.

The Mountain Belle, north of Soulsby mine, will have a trial crushing next week. The ore is of high grade; rich in sulphurets; value as high as $600 per ton. Owner, O. C. Wilbur.

THE BLACK OAK.—This mine is working steadily exceedingly rich ore, six feet wide, at No. 8 level. The ore is calcined before reduced. There is a well equipped ten-stamp mill. The sulphurets are of very high grade—ten to fifteen per cent—running up into the hundreds per ton.

The Draper-Whitto, Soulsbyville, is being re-opened. This mine has a splendid record—rock paid $100 to $150 per ton, free gold; sulphurets' value, $600 per ton. Several hundred thousand dollars have been extracted in the early days.

The Belle View Mining and Agricultural Company are drifting for a shoot at their 100-foot level. This mine is well equipped and their future prospects are exceedingly good. Ten-stamp mill, steam power—same at hoist.

The Keltz mine is paying steadily. Their fifteen-stamp mill is in constant operation.

The Star group of mines, Rose creek, is being systematically developed. They find some high grade ore on the shoots that have been exposed; value in the hundreds per ton.

The Chimney mine and extension has just started up. The ore runs as high as $300 and $500 to the ton in free gold. The vein is four feet wide. A new tunnel is being entered; 100 feet of length will give 200 feet of backs, which increases in greater proportion as entered.

The Ham & Birney, on the Stanislaus river, is well opened by four or five tunnels. They keep a ten-stamp mill profitably employed on their rock. There are many other mines working with a small force of men in this district.

Yuba.

WILL DREDGE THE GRAVEL.—The New Era Gravel Mining Company is a new corporation formed here to work an old gravel claim at Long Bar by means of a dredger, lifting the gravel from under the water and thus obviating the necessity of pumping.

NEVADA.

ON THE COMSTOCK.—*Tribune:* The ore extracted by leading Comstock companies is holding out well in value. The averages of the Con. Cal. & Virginia are $50.61 a ton. On the 1650-level they seem to be getting into a new body of ore. They find quartz at this point that assays from $8 to $10 a ton, with room ahead for a large bonanza.

At the old Ophir they have found in a porphyry formation some small streaks of ore that assay $20 a ton. These streaks are liable to lead to a large deposit of ore. The Chollar ore now being worked averages $41.12 a ton. In the Potosi they have recently found a six-foot streak of ore on the 450-level that assays from $25 to $45 a ton. In the Savage they have a new streak of ore that averages $73.13 a ton. The ore extracted at the Belcher averages $12.17, and that from the Seg. Belcher $26.53. The Crown Point is yielding gold quartz that assays from $8 to $11 a ton. They mill a little over 600 tons a week. The June run amounted to $22,182.61.

In other leading mines prospecting is active, with more or less promising material in sight. The Occidental and one or two other companies that have pay ore in sight are not at present extracting ore.

LYON COUNTY.

BONDED BY BRITONS.—*Enterprise:* Albert H. Furness of London, representing a large syndicate of English capitalists, has bonded a group of mines in Como, the Mount Como, the Palmyra and three other contiguous claims, for $400,000. Papers were signed in Dayton last week, and together with reports on the properties involved were sent to England.

There is a great flow of water in all the Como mines, which precludes any great development until such a time as a drain tunnel shall be constructed. Colonel Boyle has perfected all preliminary arrangements for the construction of such a tunnel, and active work will be commenced upon it on the 10th of next month.

The Logan mines, Colonel Boyle's properties and the claims bonded will be drained by this tunnel, which will be a lengthy one and which will entail great outlay.

BRITISH COLUMBIA.

A STAMPEDE.—D. C. Clark, owner of half a dozen mines in the Trail Creek district, brings news to Spokane of a stampede from Rossland and other points to a new district twenty miles from Trail creek, at the head of Murphy creek. Two prospectors from that almost inaccessible region brought with them some samples of surface rock, which, when assayed, went $163 in gold. The news of the find spread like wild fire, and soon hundreds were on their way to the promised El Dorado.

TWO LIVELY CAMPS.—G. W. Paine returned from the northern mining camps, including Rossland, Nelson, Ainsworth, Kaslo and Pilot Bay, and says: "There are only three mines in the Rossland district, the Le Roi, War Eagle and Josie, hut there are many prospects. Everything with an iron capping in the district has been located. There have been 2500 claims located. Each embraces 52 acres, which means that the ground located covers a territory of 150 square miles. Mr. Humphreys has been bonding claims right and left, and at prices ranging from $25,000 to $60,000. Rossland is growing at a wonderful rate; it is five times as big now as it was last March." Of the Blue Bell mine and smelter on Pilot bay he says: "The Blue Bell is one of the greatest lead mines in the world. The ore is being run through the smelter at the rate of 200 tons a day, and there is ore enough in sight to keep the smelter running at that rate 25 years. The ore is exceedingly low grade, only going 8 or 10 ounces in silver, the rest being pure lead. The Skylark and No. 1 mines at Ainsworth are shipping their ore to the smelter. The smelter uses 60 cords of wood and 100 tons of coke a day. There are 60 men employed at the smelter and 50 in the mine, and about 60 are employed cutting wood. The duty on the product of the smelter, which is shipped to the refinery at Aurora, Ill., amounts to about $400 a day. Manager Hendryx told me if the mine was on this side of the international boundary line it would increase the profits $500 a day. Fortunately, the expense of mining is small. Incredible as it may seem, the ore is mined and laid down at the smelter at a cost of 41 cents a ton."

COLORADO.

FILTERING FOR GOLD.—At the Phillip "B" mine in West Colorado Springs, the plant installed consists of a 15-horse power boiler, a steam hoister and 200 feet of cable and bucket, a 125 gallon per minute steam pump and a large battery of filters charged with the Pearce formula for collecting gold and platinum from their aqueous solutions. The flow of water is strong from the north by northwest. The values in this gold mine are found both in the water in solution and fine, very fine gold in the sand, a large per cent of which is black sand. The pump's capacity is sufficient to increase the filtering capacity to about 100 barrels.

THE NEWHOUSE TUNNEL.—The work in the Mewhouse tunnel at Idaho Springs creates a comparatively clean bore of 12x12 feet. For years past some project of the kind has been considered; Samuel Newhouse of Denver bought the Idaho Springs end of Seaton mountain and commenced to bore straight for Central City. Two air compressor plants are used. Two drills are kept going the entire twenty-four hours, with brief intervals for blasting and dumping. The tunnel is now in 3,000 feet, and when completed will be four and one-half miles in length. The dip is towards Idaho Springs and is about five inches in 100 feet.

Work has also been started on the Central City end of the tunnel, four and one-half miles from its mouth at Idaho Springs, on the Eureka mine, where a shaft is now down about 500 feet and will be continued to a depth of 1,800 feet.

VERY RICH POCKET. — A Victor dispatch says: W. S. Stratton has struck what is probably the richest lode ever found in any mine in that country. On the Independence the miners, in following a lead, "ran across a vein of sylvanite that will run $140,000 to the

ton." It was at a point where both veins came together, and statement is made that "there is not less than several millions of the ore in sight."

IDAHO.

THE COEUR D'ALENES.—About 100 men are employed at the Standard mine. The lower tunnel is in 100 feet.

The ore is taken to the Union mill to the amount of 200 tons daily and concentrated. In addition to this some first-class ore is shipped without treatment other than sorting.

The Gem mine is running to its full capacity, employing about 100 men. The mill is running on two shifts.

ALONG YANK RIVER.—The Yuhk river mining camp is not in Montana, as has been supposed, but in Idaho. The Yuhk river at that point is the dividing line between the two States, and the mines are on the Idaho side.

The nearest railroad point is Leona station, about midway between Bonner's Ferry, Idaho, and Troy, Mont., on the Great Northern. The mines are eighteen miles from Leona, almost due north.

The Capital claim was the first located, and on this most of the work has been done: assays have been showing well. The ore is free milling. There are about 150 men in the camp.

RICH IDAHO GRAVEL.—*Tribune:* Colonel A. J. Bowie has mining properties located near Leesburg. His past year's experience upon a gold bar near Leesburg has demonstrated its value. He has, in proving up the values of the gravel, taken out $30,000, and in doing so has worked only on a limited flow of water. What is needed, he says, is an increased supply, and when that shall have been acquired, the property, he feels sure, will become one of the most productive in the West.

MONTANA.

THE ANACONDA SMELTER.—*Review:* In the new building, within the last six weeks, more than 2,000,000 brick have been laid. Four matte furnaces will soon be ready to fire up. There will be fourteen of these matte furnaces in the building. At present twenty calciners are in operation in No. 1 smelter. The calciners are taken to matte furnaces at the lower works. The new matte furnaces are connected with the old flue of No. 2 smelter. This has been bulkheaded at the south end and is now connected on the north end with the high stack which carries off the smoke from the copper smelter. The new flue carries off the smoke from No. 1 smelter, which contains forty calcine furnaces. The new automatic copper dipper at the copper smelter is not yet in successful operation. At the new refinery building, carpenters are engaged in building the tank foundations. The lead lining for the vats has arrived. This required a train of cars to haul it. Opposite this building six boilers are being placed in position to supply power to operate the electric dynamos furnishing the current for the refinery.

WILL BUILD A DITCH.—The Eureka Mining Company is preparing to commence the work of putting in a ditch at an estimated cost of $9000. Hiram W. Rogers is secretary and treasurer. The ground owned by the company is located in Quartz gulch, a tributary of Rock creek, about fifteen miles from Philipsburg. The company proposes to put in a ditch that will carry 600 inches of water.

A NEW ORGANIZATION.—*Inter-Mountain:* The Queen Mining and Milling Company has been organized in Great Falls, with Harry Hill secretary and treasurer. It is built upon what is left of the Queen of the Hills Mining Company, and provides for the issuance of 300,000 shares at $10 each. The company extends an offer to the individual stockholders of the original Queen of the Hills Mining Company to enter the new company by purchasing shares at the rate of 28 cents.

OREGON.

AT CORNUCOPIA.—The Union-Companion Mining Company at Cornucopia has contracted with the I. B. Hammond Company, of Portland, for a twenty-stamp mill.

CANYON CREEK PLACER MINES.—The placer mines of Canyon creek, Marysville and Prairie diggings have produced over one-half of the gold taken out of the different placers in the county, or over $2,500,000. Canyon creek is credited with $2,000,000 as its output. Over 4000 men were employed in 1894 on the creek. With the exception of the Humboldt mine, no hydraulic mining has been done. The work consisted of stripping off the ground to within two feet of the bedrock. The remaining gravel was wheeled into sluice-hoxes and washed. Wages were $3 per day, and nothing but the richest parts of the creek worked. The east side of the creek, below Canyon City, was not considered rich enough, and has not been worked. The dirt stripped off varied in depth from eight to sixteen feet, all of which prospects well. It is claimed by all of the old-timers yet residing in the county that not one-half of the gold has been taken out of the creek.

SOLD TO MICHIGAN MEN.—W. Q. Brown has closed a deal with George E. Nichols, representing Grand Rapids, Mich., men, whereby 320 acres of mining claims have been transferred. The property comprises the claims of W. H. Gordon, J. L. Scott, W. Huggins, N. Sehring and W. Q. Brown. The company was organized at Grand Rapids, Mich., with a capital of $2,500,000. Secretary, G. E. Nichols; T. L. McGarry, W. H. Woods, G. E. Nichols, C. E. Brown and W. W. Thompson, directors.

ON THE SANTIAM.—In the Quartzville mines forty men are employed, tunneling, laying track for new cars, and making ready for machinery. The wagon road from Gates, on the Oregon Eastern and Central road, into the mines, has been graded. It is eighteen miles long; the mining company has expended $2500 putting it in repair.

Superintendent W. B. Lawler, having some capital himself, has induced capital to believe there is a field for investment in these mines, and has enlisted sufficient to make a test. The company's engineer, Arthur L. Pierce, sailed for London from New York on the 20th ult. When the kind of machinery is decided upon by the members of the syndicate in London, Engineer Pierce will cable specifications immediately to Mr. Lawler, so that excavations may be made in accordance therewith. The machinery will cost $25,000. The outlay necessary to put the mill in position, ready for operation, and the expense in getting ore ready to be crushed will approximate $100,000. Mr. Lawler states that a 20-stamp mill will be dropping at the Quartzville mines by the 1st of January.

MAID OF ERIN SOLD.—The Maid of Erin mine, owned by P. Long, was sold in Baker City last Tuesday for $10,000, mostly spot cash, to A. Dragovich of this city and J. Conlisk and H. C. Baker of Ogden, Utah. The mine is on the Union county side of Powder, on the Baker City-Seven Devils road.

SOUTH DAKOTA.

KEYSTONE.—*Pioneer:* The Holy Terror Company is sinking the original shaft, which is 65 feet below the 85-foot level. They expect to go down 300 feet. The mill is shut down at present.

Work is being pushed on the Keystone shaft and will be kept up until a 400-foot level is reached. There are fifteen stamps at work.

WASHINGTON.

MINING DEAL NEAR LEAVENWORTH.—John Stanshury, representing the Tacoma Smelting Company, has bonded several claims on Pike creek owned by Hood and Grant of Leavenworth.

Pike creek is a small stream joining the Peshastin river three miles above the mouth of Ingalls creek. The formation all along the stream indicates gold and several claims have been located a long time. It is near the old Blinn stamp mill, now owned by the Cascade Mining Company, which was a liberal producer of gold 15 years ago.

Mr. Stanshury is also examining some nickel properties on Red Butte mountain, Ingalls creek.

G. A. Weber has been relieved as superintendent of the Ontario mine, and other changes are expected to be announced in the near future.

WYOMING.

NEAR HAHN'S PEAK.—Twenty men a day are going into the Columbine camp, near Hahn's peak. Appearances indicate a permanent camp. Much of the mortaring and panning show free gold. The rock is of a carboniferous nature, and resembles the Leadville carbonate. A number of the prospectors are from Aspen, Colorado, and are working in the interests of David Brown. Red Park, north of the peak, has a camp of twenty-five men and Columbine 200 men.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891, the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

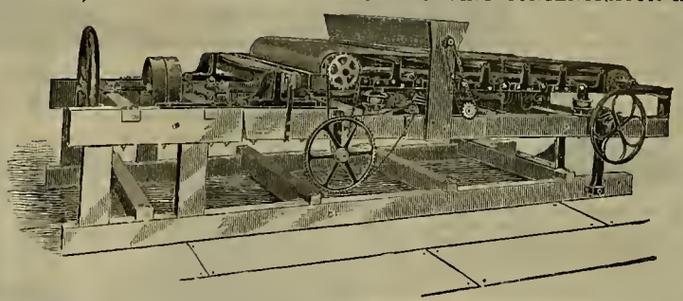
This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1895.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show " " " from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, " " " a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

Office of THE CLEVELAND IRON ORE PAINT CO. and THE GARRY IRON ROOFING CO., CLEVELAND, O., Jan. 25, 1894.

The American Mining & Milling Machinery Co., Cleveland, O.:

GENTLEMEN:—We purchased a No. 2 American Rock Breaker and a No. 2 American Ball Pulverizer from your company about one year ago. The latter part of April, 1893, we started up for regular work, since which time we have run both of said machines to the full extent of our demands and to our entire satisfaction. The first 700 tons of hard iron ore that we pulverized for paint purposes was ground without taking the Pulverizer apart, and without expending one dollar for repairs for either of these machines. Of the 700 tons spoken of, about 200 tons was Lake Superior Specular iron ore, containing some 70 per cent iron; a very difficult ore to pulverize. The remainder was a red fossiliferous iron ore, carrying quite a per cent of silex, which cuts out buhr-stones rapidly. We find that the steel balls, which were when new 5 in. in diameter, now caliper 4⅞ in., and are perfectly round and smooth. The grinding track shows very little wear, and the driving truck shows less; in fact, the wear is almost imperceptible. These two machines crush and pulverize more than one ton per hour with less than 12 H. P. We do not know of any Crusher or Pulverizer that can compare with the output of these two machines in quantity, quality, small amount of wear and tear, and like power. In our opinion, you cannot recommend them too highly. Very truly yours,
CLEVELAND IRON ORE PAINT CO.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 1, 1895.

The advance in metals continues. During the week the Wire Nail Manufacturers' Association have advanced the price of nails 50 cents per keg. The advance is said to be the result of the Consolidated Wire Nail Company getting control of almost the entire product of the country.

Copper continues firm, as also iron and steel. A dispatch received from Pittsburg this afternoon says:

Reports dealing with the condition of the iron trade show some irregularity. On the whole, however, the industry is holding its own remarkably well. Bessemer pig iron has been quiet since the recent large transactions which have taken out of the market two of the large Shenango Valley furnaces for a considerable period.

In the East a number of small lots have been picked up, but on the whole the shortage remains. Steel billets weakened a little early in the week under review, largely because of the labor troubles at the wire rod mills. The numerous inquiries appeared in the market and the old range of prices was recovered. The mills in the Chicago district are crowded with work. The strongest article in the whole list of finished goods is plates, which are extremely scarce.

Car building has been more active lately and has found its expression in heavy demand for bars. The Western Association has again made an advance, this time of $2 per ton, and the western markets have followed suit with a rise of 1 1-10c per pound.

There has been some easing up in the pig iron markets lately. Cincinnati reports indicate that in the West this feeling has been only temporary. In the East cutting has been confined chiefly to mill iron. Copper has stiffened further for the consumption, showing good increase.

Mining Share Market.

SAN FRANCISCO, August 1, 1895.

There were a few sales during the week at prices that varied a few cents. The only sensation was the announcement by a prominent Con. Va. stockholder that he would bring suit in the U. S. Court of Nevada against Supt. Lyman to compel that official to furnish an accounting. The Hale & Norcross decision still slumbers in the Supreme Court. The mining companies' dividendsin July '94 were $107,350; in July '95 they aggregated $156,250, being as follows: Alaska-Mexican Mining Co., 15c ₱ share, $30,000; Alaska-Treadwell Mining Co., 37½c ₱ share, $75,000; Homestake Mining Co., 25c ₱ share, $31,250; Napa Con. Quicksilver Mining Co., 20c ₱ share, $20,000.

Senator Jones of Nevada is in the city. Jno. W. Mackay is expected here about the 15th inst.

At the annual meeting of the stockholders of the Lady Washington Mining Company Jno. Landers was elected president, H. Zadig vice-president, and Messrs. Goodrich, McBoyle and Stauf, directors. J. E. Jacobus was re-elected secretary, and E. D. Boyle superintendent.

The following illustrates the changes of the week:

Gold Quartz Mine

FOR SALE AT A BARGAIN.

Eight Quartz Claims, with 10-stamp mill, complete. Income paying and now in operation. For $90,000, easy payments. Worth $250,000. A "snap" if sold within three weeks; after that time $200,000 will be the price. I want to find a mine purchaser who means business at once.

Four-foot vein ore $20 to $40 per ton.

J. F. CROSETT, 628 Sacramento St.

WANTED!

A COMPETENT MILL MAN,

Who understands Vanner Concentration and plate amalgamation, as assistant in a 50-ton concentrating plant in northern Mexico. Salary $125 U. S. Currency per month. Must be thoroughly sober and well recommended. A married man preferred. Address B. D., care this office.

WANTED.

A thorough miner, bookkeeper, assayer and millman desires position. Several years experience in California and Nevada mines as superintendent and foreman. Good references. Address J. S., 1133 Market St., Stockton, Cal.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of May, 1895, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order from the Board of Directors, made on the 24th day of May, 1895, so many shares of each parcel of such Stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, corner Montgomery and Market streets, San Francisco, California, on Monday, the 22nd day of July, 1895, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office—38 Crocker Building, San Francisco, California.

POSTPONEMENT.

By a resolution of the Board of Directors of the Gold Bar Consolidated Mining Company the day of sale of the above delinquent stock has been postponed to WEDNESDAY, August the 21st, 1895, at the same place and at the hour of 2 P. M.

E. C. GODFREY, Secretary.

Office—Room 38 Crocker Building, San Francisco, California.

WANTED SITUATION AS BOOKKEEPER and Assayer in mine. A 1 references. Communications confidential.

Address X. Y. Z., This Office.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

GOULD AND CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the second (2d) day of July, 1895, an assessment (No. 76) of Fifteen (15c) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixth (6th) day of August, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the Twenty-eighth (28th) day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 5th day of July, 1895, an assessment (No. 27) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 12, rotunda, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 4th day of September, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. W. SARGEANT, Secretary.

Office—Room 12, rotunda, Mills Building, San Francisco, California.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CRUSHING AND GRINDING MILL.—H. L. Lightner, San Francisco, Cal., and J. J. Newsom, Oakland, Cal., assignors to H. L. Lightner, H. C. Biggs and O. C. Haslett of San Francisco, Cal., and Jessie L. Newsom of Oakland, Cal. No. 542,087. Dated July 2, 1895. This invention relates to that class of mills for breaking up and reducing rock, ore and other materials and in which a muller, operating within a mortar, has imparted to it a wabbling motion over a fixed die in the mortar and about a central cone therein by means of a crank pin applied to it. The mill consists of a mortar having a central cone, a hollow shell forming a cylindrical or conoidal muller, a non-gyratory shaft passing up through the central cone of the mortar and having a crank pin fitted thereto just below the top of the muller and passing loosely through the same, and means for rotating the shaft. It also consists in other details relating to the construction of the mortar, the hopper and the means by which the mill is kept lubricated. The object of the invention is to increase the efficiency of a mill of this general character, not only with respect to its grinding or pulverizing action, but also to adapt it, by reason of the strength, shape and weight of its parts, and especially of its muller, the hopper and position of the driving shaft crank, to the crushing of rock.

COIN RECEPTACLE AND REGISTER.—Arthur W. Coffin, S. F. No. 542,796. Dated July 16th, 1895. This invention relates to a device for receiving and holding coins, and registering the number or amount of the various coins thus received. It consists of an interior case, having a dial with subdivisions and figures indicating amounts, a hand or pointer centrally pivoted and movable over said dial, interior mechanism by which the pointer is advanced in one direction by the introduction of a coin and proportionately to its diameter, slots in the periphery of the case for the introduction of the coins, and a mechanism intermediate between the pointers and an arm which is movable by the introduction of a coin, whereby the pointer will be advanced over the dial to indicate the amount of the coin thus introduced.

ASH AND SOOT PAN.—Herman Colman, San Francisco, assignor of one-half to Julius Colman, of Oakland. No. 542,797. Dated July 16, 1895. This invention relates to a combined ash and soot pan, to be used in conjunction with stoves and ranges. The object is to so construct the pan which receives ashes from the grate that any deposits of soot from beneath the oven may be raked directly into the pan and removed, without the necessity of removing the pan and drawing these deposits into the space usually occupied by the pan, and afterwards removing them with a shovel. It consists of a pan adapted to fit the ash pit beneath the grate of a stove or range, and having an open rear side and vertical guides, within which a sliding gate or door is adapted to move, so that for ordinary purposes the pan is closed upon all sides, but when the deposit is to be removed from beneath the oven this grate may be withdrawn, leaving the rear portion of the pan open toward the space beneath the oven.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

VOLUME LXXI. Number 6. SAN FRANCISCO, SATURDAY, AUGUST 10, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Cheap Ocean Transportation.

There arrived here on the 1st inst. a raft of logs from the Columbia river, the first shipment of the kind on this coast, and a noteworthy event in the history of cheap ocean transportation. From the days of the old Sylvia de Grace, when freight on lumber from the Columbia river to San Francisco was $100 per M ft., board measure, to the present, the cost of lumber in San Francisco has been a varying problem. For the last ten years freight has been from $3 50 to $5.00 per M., by sailing vessel from Puget sound and the Columbia river, where is found the finest spruce and fir. The success of the present enterprise means considerable to California in the matter of cheap lumber. The idea of rafting logs down the coast from Oregon and Washington to California ports has long been entertained. Several attempts have been made, all resulting disastrously, the rafts going to pieces amid the ocean waves and forming a serious menace to coast vessels, sail and steam. The effort has at last been successfully carried through, and a brief account of the scheme will be of interest to our readers.

RAFT COMING DOWN THE COLUMBIA RIVER IN TOW OF TUG, WITH RIVER STEAMER AFT TO ASSIST IN ROUNDING TURNS IN THE RIVER.

Nine years ago H. R. Robertson, of St. Johns, N. B., patented the Robertson cigar-shaped raft. He built a raft of logs at Port Joggins on the Bay of Fundy in 1888, which was towed to sea by the steamship Miranda, bound for New York. When half way on its voyage over the Atlantic, during a heavy storm the hawser parted; the sea was rough, and the steamer was unable to recover her tow, finally abandoning it. It drifted over the sea, and at last went ashore on the Western islands, off the coast of Africa. The inventor returned to Port Joggins and began building another raft on the same general lines, with some improvements suggested by experience. This one was successful, being towed to New York by the tugs Underwriter and Ocean King, the seven hundred miles being accomplished in ten days. Since then several rafts containing millions of feet of timber have been transported from New Brunswick and Nova Scotia to New York in this manner.

Mr. Robertson came to this coast two years ago, and, with W. E. Baines, built on the Columbia river a plant for the construction of these rafts, and prepared a raft for shipment here. It sailed from Astoria, Oregon, in tow of the tug Monarch October 12, 1894, but struck severe weather and was finally wrecked, having made about 150 miles of its 600-mile journey. The owners lost heavily, but pluckily concluded to try it again. Accordingly, last March, at Stella, Washington, they built a big cradle or frame and started putting together another raft. This frame was somewhat similar to the gridiron frame used in shipyards for the construction of large vessels, and it conformed in many respects to the lines of the whaleback type, the chief difference being that this frame was anchored to a row of piles by means of loose anchor boxes, with sufficient play to admit of the frame rising and falling with the tide. The frame was also constructed by an arrangement of key pins, which, on being drawn, admit of the frame falling apart in complete halves, thus releasing the raft when constructed.

In May the raft was about half built. The illustration on page 88 shows how the giant structure looked at this stage of its construction. The photographs from which the cut on page 88 was engraved, as well as that one on this page, were taken specially for the MINING AND SCIENTIFIC PRESS, the enterprise being deemed of sufficient interest to warrant extended notice in this journal. The raft was completed the first week in July. It was towed to Astoria, Oregon, seven miles from the mouth of the Columbia. The engraving on this page is from a photograph of the raft in tow of the tug and a river steamer alongside as it passed down the Columbia river. The point selected by the photographer for the view is in Cathlamet bay, about three miles above Tongue Point, which is seen on the left of the picture, and which is two miles east of Astoria, where it arrived on the 26th ult. The steam tug Mineola made fast to the huge raft at noon on the 27th, crossed out to sea at a four-knot rate and in a comparatively smooth trip down the coast, passed Point Reyes at 9 A. M. on the 1st, arriving safely at Alameda Point, San Francisco bay, at six that afternoon, 600 miles in five days and six hours.

The raft is 580 feet long, and is shaped like an immense cigar. It is fifty-two feet in width; its girth at the midship section is 139 feet, and at the ends of the tapered sections forty-five feet. Where built at Stella, about ten thousand logs were hoisted by means of donkey engines into the cradle, which gradually settled down in the water. When completed the top of the cradle was on a level with the water, while the top of the raft was ten feet above it. When all the logs were loaded into the cradle the raft assumed the shape of a cigar, tapered at both ends; it was then bound together with heavy chains. The main chain, running fore and aft the entire length of the raft and through its center, is of one and seven-eighths-inch iron. Running at right angles to the main chain, and at regular intervals of twelve feet, are cross chains of one and a quarter-inch iron. These are connected with the main chain and run to each side of the raft. These chains are in turn secured to encircling chains of one and three-eighths-inch iron, which encircle the outer circumference of the raft, also at regular intervals of twelve feet. All chains are connected with the main chain in such a manner that when the strain of towing came on the main chain the strain was brought to bear equally on every chain in the

TABLE OF CONTENTS.

ILLUSTRATIONS.—Raft Coming Down the Columbia River in Tow of Tug, with River Steamer Aft to Assist in Rounding Turns in the River, 85. Filling Cradle with Logs—Raft About Half Built, 88. Electric Pump; Electric Locomotive in Workings; Map of Mine; Electric Drill, 89.

EDITORIALS.—Cheap Ocean Transportation, 85-88. The Horr-Harvey Debate; Cost of Producing an Ounce of Silver and Gold, 86. The Hale & Norcross Decision, 86-87-90.

SCIENTIFIC PROGRESS.—The Universal Force; Alloy of Copper and Aluminum; Alcohol by an Entirely New Process, 91.

MECHANICAL PROGRESS.—New York's New Suspension Bridge; Accuracy of American Tools and Workmanship: Third Avenue Bridge, New York; Important Changes in the Mode and Means of Newspaper Making; The Ball Nozzle; Magnetic Observations; Standard of the Loudness of Sound; Celluloid, 91.

ELECTRICAL PROGRESS.—Causes of Atmospheric Electricity; The Kaweah Irrigation and Power Co.; The Baltimore and Ohio Railroad; Electric Feeder Lines; Electricity and Street Railway Propulsion; Electric Railway Commission; Electric Carnival at Sacramento, 92.

PRACTICAL INFORMATION.—The British Census; North Pole by Balloon; Maintenance of Secrecy by Telephone Employes, 92.

MINING SUMMARY.—From the Various Counties of California Nevada and Other Pacific Coast States and Territories, 94-95.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 98.

MISCELLANEOUS.—Concentrates, 87. South African Gold Output in 1894; Towing by Means of Electricity; Report of the Geological Survey for 1894; Electricity as a Motive Power on Steam Roads; The Harqua Hala Mines, 88. Electrical Mining Plant, 89. The Equator; Road from Red Bluff to Eureka; Strike at Trail Creek, B. C.; Coast Industrial Notes, 90. Notices of Recent Patents, 99.

MUCH is being said and sung about the cost of producing an ounce of silver, and the cost of producing a similar quantity of gold. In the recent Harvey-Hoar debate (which leaves everything as it fouud it), it was brought out that in isolated instances it cost only sixty cents to "produce" an ounce of silver. But this proves nothing any more than is shown by the report of a Colorado mine broker, received here, to the effect that in one instauce gold is produced there at a cost of forty cents an ounce. The man who, walking along the street, finds and picks up a $20 gold piece, had that "produced" for him at a cost, to him, of less than one cent, yet it cost some one $20. As well use the cost in the finder's case as in another isolated case where fortuitious and extraordiuary circumstances make it possible to "produce" gold for forty cents an ounce or silver for sixty cents an ounce. Taking a larger view of it, it is probable that every ounce of silver mined in the world represents a cost of more than $1.25, and every ounce of gold more than $20.

IN the great Horr-Harvey debate the monometallist champion reiterated the old short-sighted statement that owners of silver mines were alone desirous of and interested in the bimetallic staudard: that they wanted a market for "pig silver," and that it was simply a question of marketing their production. In sayiug this, Mr. Horr shows his lack of comprehensiou. Such silliness is unworthy any one claiming sufficient intelligence to discuss the matter. A pointed negative to his proposition comes from Ohio, which is largely "a gold bug" State. The Standard Wagon Co. of Cincinnati failed last week: assets, $300,000: liabilities, $400,000. The company had plenty good orders and was honestly and efficiently managed. The president of the concern was asked the reasou for the failure. His answer is worthy of study by Mr. Horr and statesmen of his school. He said thcy carried a large indebtedness, and added: "While our mercantile creditors were generous, our bank creditors were not. The banker's dollar has its purchasing power almost doubled, while the manufacturer aud business man's dollar invested in buildings, machiuery and merchandise is reduced fully 50 per cent." There is the whole silver question iu a nutshell. It affects the merchant, manufacturer and producer more than the miner. The miner is in the same position as the man in the wagon drawn by the runaway team, who said he could ride as fast as they could run.

The Hale and Norcross Decision.

"All things come to him who waits," even to waiters for legal decisions. Last Saturday the Supreme Court of this State gave its decision in the celebrated Hale & Norcross suit. It will soon be five years since M. F. Fox began suit against the Hale & Norcross Mining Co., the Nevada Mill and Mining Co., H. M. Levy, Hayward, Hobart, et al. In August, 1890, Fox, delegated by an association of the stockholders of the mine, wrote to the directors that he had conclusive proof that for three or four years the stockholders had beeu systematically robbed by a ring controlling the output of the mine and the manageineut of the mill; that over $2,000,000 had thus been wrongfully withheld, and demanding restitution. No notice being taken of this, he began suit in October, '90. The trial began before Judge Hebbard of the Superior Court November 18th, '91, and was sensational. In May, '92, the Judge rendered a decision which was a surprise to many. Messrs. Levy, Hayward and Hobart were decided to be parties to a conspiracy to rob the mine by dishonest manipulation of the ore in the Nevada and Mexican mills. Judgment was pronounced against them and the Nevada Mill aud Mining Co. for $1,011,835. The other directors, A. K. P. Harmon, C. P. Eagau, C. S. Wheeler and J. Marks, were found guilty of negligence, aud judgment entered against them for $208,172; E. B. Holmes was held responsible for $60,905, and J. Souther, W. E. Sell and C. T. Bridge for $12,045. The enormous costs in the suit were also put ou the defendants. Their motion for a uew trial being denied, they appealed to the Supreme Court. The case has been before that court a long time and many unjust things have been said on and off Pine street regarding the delay. Much of this criticism has been undeserved. The case did not get before the Supreme Court as at present constituted till January 22, '95, and its magnitude, as well as the multiplicity of record matter, made it impossible for the court to give a decision much sooner. The transcripts of the testimony, the briefs, arguments, etc., make over 15,000 printed pages. Chief Justice Beatty, who wrote the decision, is one of the slowest of men. He was slow when judge of the District Court in White Pine, Nevada, twenty years ago; he was slow when subsequently Chief Justice of the Nevada Supreme Court, and age has not contributed to the celerity of his mental movements. But of his integrity or of the motives of his colleagues not one derogatory word cau be said.

The verdict is a victory for the plaintiff; Judge Hebbard is partially sustained; the case is sent back to his court for a new trial on some of the issues; judgment is given against Hayward and Levy for $210,000 and interest, and to the lower court is left to say how much more. In the first part of the decision the court goes over the facts recited before the lower court.

That during the three years 1887, 1888 and 1889, the Hale & Norcross mine delivered to the Chollar, Nevada mill and to the Mexican and Vivian mills not less than 80,000 tons of gold and silver ore; that the ores were worth not less than $3,250,000; that Haywards and Hobart were the biggest stockholders in these mills; that these two men conspired with the directors to gather all the fruits of the mine at the expense of the stockholders; that they used proxies to capture places on the directorate and so maintained themselves in power; that they used this power to seleet the agents and employees about the mills and mine; that they directed the ores to the mills owned by them and caused the superintendent of the mining company to suppress in his reports the real assay of the ores; that the mine reports were doctored to conceal the fraudulent gains of the combination; that low grade ores were mixed with high grade ores to run up the milling bill for the owners' benefit; that imperfect milling was done so as to leave gold and silver in the tailings, slimes and residues, all of which were carefully rehandled to the profit of the combination and to the loss of the stockholders for over $1,000,000; that exorbitant rates were charged for the milling and $280,000 was lost that way; that 6,000 tons of ore, valued at $480,000, was shipped away, lost ou the books and never accounted for, and that altogether $2,000,000 at least was filched from the pockets of the unsuspicious stockholders and divided by the conspirators.

We shall first consider, says the Court, that in relation to the conspiracy to mine and send to the mills ore not worth the cost of mining and reduction. Although the Superior Court finds that worthless ores were mined and milled to the loss and damage of the company, the amount of such damage is not found, and it does not enter into the judgment rendered against any of the defendants—the damages awarded by the several judgments consisting of hut two items, viz: The excessive price paid for milling all the ores, rich and poor, and the bullion lost hy imperfect milling. But as it affects the motion for a uew trial, and as indicative of the views of the Superior Court as to some items of evidence, which equally affect other questions, it is deserving of some attention.

According to the testimony of Mr. Mackay—and there is nothing to the contrary—ore of a car sample value below $14 per ton will not pay for the cost of reductiou, hy which I understand him to mean that such ore will pay the hare cost of mining in a going mine, added to the bare cost of milling, witbout any profit to the miller or compensation for the use of his mill. His meaning, in other words, is that a mining company, with its mine already opened and in running order and owning its own mill, could hoist and mill $14 ore without going behind. In any other sense his testimony on this point is inconsistent with his testimony as to the usual disparity between the car sample assay and the battery sample assay and the percentage of the latter that ought to he obtained by good milling. In order, however, that $14 ore may pay expenses, it must, according to Mr. Mackay, contain about an equal value of gold and silver. Otherwise, owing to the heavy discount on silver, it will not pay. Now, the evidence in this case shows that the foreman of the Hale and Norcross mine was in effect instructed to mine and send to the mill ore assaying hy car sample as low as $12, and it appears that the Hale & Norcross ore contained a much larger percentage of silver than of gold.

In view of these facts, which show that the practice and the iutention was to send to the mills all ores assaying by car sample as high as $12 per ton, and in view of the understanding that the mills are to receive not merely the bare cost of workiug the ores, but $2.50 in addition to the cost for the use of the mills, it cannot be said that the finding of a conspiracy to mine worthless ores is without any support in the evidence.

I account for the fiuding and for the fact that no damages are awarded hy reason of it in this way: The Superior Court held that, in view of the contract or understanding, that $7 per ton was to be paid for the milling, and the actual return in hullion of only about 75 per cent of the battery sample assay, the parties must have known that only $14 ore, hut ore of eveu a higher grade was being mined and reduced at a loss. In determining the question of damages, however, all losses were comprised under two heads, viz: excessive price paid for milling, and loss hy imperfect milling. In order to determine these amounts the milling was reduced to actual cost, and the defendants were charged with 75 per cent of the car sample assay. This being done, there remained no appreciable loss on the milling of low grade ores, except up in the comparatively small quantity assayiug less than $12, which the court was justified in finding was unintentionally and unavoidably deposited in the ore bins before the assays could be returned. The calculation upon which I suppose the court to have proceeded would he as follows: 75 per cent of $14 is $10.50, or gold $5.25 and silver $5.25, which at 80 per cent equals $4.20, making a net yield of $9.45, of which $4 50 was allowed for milling and $4.95 for cost of mining. I do not think that this basis of calculation was entirely correct, in view of other evidence in the case, hut it was the hasis upon which the court seems to have proceeded, and assuming its corrections, the finding in question and the conclusion of the court are rendered perfectly consistant.

Upon the whole I thiuk the evidence sufficient to sustain the finding.

The next and hy far the most important exceptiou to the decision of the Superior Court relates to the various findings to the effect that Hayward, Hobart, Levy and the other defendants worked the ores of the Hale & Norcross Company hy a fraudulent system of imperfect milling, hy which a large portion of their value was left in the slimes, tailings and residues of the mines. The substance and effect of those fiudings is that 88,887 tons of ore were worked; that its value was $3,505,361, as correctly shown by the car sample assays, and that if said ores had been honestly crushed and milled, and the gold and silver honestly and with reasonable care extracted and accounted for, the bullion yield would have been $2,616,491, whereas the actual return made hy the mills was only $1,826,883, and the difference between these two sums, $789,618, is the priucipal item of the damages going to make up the judgment. The principal and most direct evidence in support of this finding consists of the car sample assays, which, it is contended, is corroborated and confirmed hy proof of certain irregular and suspicious transactions hetween the managers of the mills and the Carson Mint, as well as some other circumstances of like complexion and import.

The appellants contend that, even taking the car sample assays as a criterion of the amount of gold and silver in the ores mined and sent to the mills, the estimate of the Superior Court is erroneous and excessive to the extent of $34,427, and they sustain their contention hy a citation of the pages and folios of the record, to which counsel for respondents have made no reply. If there is any mistake in the computations which apparently demonstrate the error alleged, it was the duty of counsel to bave pointed it out. In the absence of any attempt to do so I should perhaps have been justified in assuming that the error was conceded. I have, however, gone over the figures as carefully as I could, and while my computation does not exactly agree with that of counsel for appellants, it does agree substantially. The error of the Court amounts to over $30,000, the larger portion of which is found in the first item of the account, where 1259 tons and 1500 pounds of ore delivered at the Vivian mill in December, 1887, of the car sample value of $72.12 per ton, is found to have amounted to $113,518.41, when its real value was only $90,856.41, an error of nearly $23,000 in one item.

But the appellants contend that the car sample assays do not, as found by the Court, correctly show the true value of the ores, and in this connection they call attention to what they say is an inconsistency between the findings that the value of the ore was $3,505,361 and that it should have yielded $2,616,491 in hullion. I do not deem this an inconsistency. One stands for the total amount of gold and silver in the ores and the other for the percentage (about 75 per cent) which, in the opinion of the Court, it should have yielded under proper treatment.

This objec'ion disposed of, we come to the pivotal question in the case—the value of the car sample assays as a criterion of the value of the ore. The testimony is without conflict that, according to the general custom and course of dealing between the miners on the Comstock lode and the managers and owners of custom mills, the battery samples are, and the car samples are not, regarded as the true index of the value of the ores; that all settlements between miner and miller are hased upon the average assay of the battery samples, and the car sample assays are for the guidance of the miners, and useful as a check upon the mills. There is also no conflict in the evidence that the car samples always run above the true value of the ore. This fact was clearly proved when the plaintiff closed his case, in chief hy the testimony of his own witness, John Mackay, and it was much more fully proved by a number of witnesses sworn on behalf of the defendant.

The miling of the Hale & Norcross ore was not in itself an unlawful act. The means hy which the employment to mill them was obtained was wrongful, and entails the penalties which are to he considered hereafter; hut the milling, if properly conducted, was a lawful, legitimate and necessary operation. The form of the ores was, of course, changed, and their identity destroyed, hut the usual means and the only means of establishing their value was taken and the evidence preserved. They were the car sample and the pulp sample and the settler sample assays, all taken according to the usual course of husiness, and all preserved. They constitute the most direct and trustworthy evidence of the real value of the ores, while all other means of proof are indirect and secondary. So far as they are indefinite or uncertain, the willful suppression of any secondary evidence or corroborating circumstances which would tend to clear up such uncertainty, would justify a Court in giving to the direct evidence the strongest construction in favor of the other side that it would reasonahly hear. But, as has been shown, the evidence in tbeir case is all to the effect that the car sample assay is iuvariably and largely in excess of the actual value of the ore

and that it is not unreasonable in the face of such evidence to assume the car sample as a basis of computation. This is not holding that the respondent is bound by the battery samples, or that a deduction from the car samples of $10 per ton, or of any definite sum, must be made, but only that the trial court should give proper consideration to the uncontradicted testimony of all the witnesses and to make such deductions as in its judgment is reasonable, in view of all the evidence.

As to the claim that evidence was suppressed by failing to keep any record of the bullion resulting from the working over of concentrates, and by the refusal to produce the books of the Nevada Mill and Mining Company, the record does not bear out the assertions of counsel. There is no record kept in the mill of the workings of the concentrates, or, as far as appears, of any other part of the business. The books containing a record of the business of the mill were kept at the office of the corporation, and the testimony of Williams, the superintendent of the mill, is that the account of the proceeds of the concentrates of all the ore worked in the Nevada mill, amounting to 93,000 tons of Hale & Norcross ore, was kept in the books of the corporation and showed a product of only about $14,000. Mr. Williams, when the crude bullion was delivered to him by the foreman of the mill who had charge of the retorting, and who kept a memorandum of the weight, took the bullion to the assayer, who in a few days returned the resulting bars with his certificate of weight, fineness, value, etc., to the office, and he says that in the meantime he made no written entry of the weight, but carried it in his head. This may be a loose way of conducting business, but it is not a suppression of evidence. As to the refusal to produce the books of the company, counsel does not recite the evidence in the record, and I have been unable to discover that any demand for the production or inspection of the books was ever made.

My conclusion is that the Superior Court did not err in requiring the mill owners to account for $2.50 per ton for all the ores milled by them, and this part of the judgment, which is erroneous only so far as it includes the ores worked at the Vivian mill, may be modified upon the findings contained in the record. The proper sum is $2.50 per ton in 84,079 tons, the quality of ore sent to the Nevada and Mexican mills amounting to $210,197.50. To this extent the judgment against Hayward and Levy is fully warranted by the findings and evidence.

As to the Nevada Mill and Mining Company, it would be necessary to reduce this part of the judgment still further, on account of the fact that it had nothing to do with the ores reduced at the Mexican mill; but this and all other errors in the proceedings affecting that corporation became immaterial in view of my conclusion that it was never brought under the jurisdiction of the Superior Court. It is a Nevada corporation, and the only service of summons was made on Evan Williams, the superintendent of its mill, at Virginia City, who was at time of service in attendance upon the trial of the cause, but not engaged in attending to any business of the corporation in this State. Such service was wholly insufficient to confer any jurisdiction over the company, and the judgment as to it is erroneous in toto.

As to the Directors of the Hale & Norcross Company, other than Levy, it is not seriously contended that they are liable except on the ground of negligence, and it is clear that such was the opinion of the Superior Court. But they were not charged with negligence in the complaint, but only with fraud. Fraud and negligence, however culpable, are not the same things. It is true that when negligence causes an injury of the same character as would be occasioned by an intentional fraud, it is visited with the same consequences, so far as compensation to the injured party is concerned, but the plaintiff has no right to demand a conviction of fraud when no fraud has been committed. When he relies on fraud he ought to plead fraud and when he relies on negligence he ought to plead negligence, not only because the defendant has the right to know what the charge is which he is called upon to meet, but because the defenses are different. An action for relief on the ground of negligence is ordinarily barred by the statute in a shorter time than action for relief on the ground of fraud. In this case, however, it is contended that the action against the directors is founded upon a liability created by statute, and, consequently, that the same limitation of the right to maintain the action applies as in cases of fraud. (C. C. P., S. 338.) The statute referred to is Sec. 3, Art. XII of the Constitution, which contains the following provision:

"The directors or trustees of corporations and joint-stock associations shall be jointly and severally liable to the creditors and stockholders for all moneys embezzled or misappropriated by the officers of such corporation or joint-stock association during the term of office of such director or trustee."

This clause of the Constitution has never been construed, so far as I can discover. According to its literal terms every director of a corporation is severally liable for the full amount of any misappropriation of its funds during his term of office, without respect to any question as to his own culpability, and the argument of counsel is that it must be enforced according to its letter. *Ita lex scripta est*, and hence a director, no matter how innocent he may be, must be adjudged to pay, at the suit of any stockholder, the whole of any misappropriation of corporate funds accruing during his term of office. And, therefore, according to the contention of counsel, if some large stockholder of the Hale & Norcross Company, with the sole purpose of protecting his own interests and the interests of the other stockholders, had, by cumulating his stock, secured an election to the board of directors, and as a member of the board opposed the milling of low grade ores, or the paymeat of more than $4.50 per ton for milling, and had to the utmost of his ability guarded the interests of the company in every direction he could, nevertheless, have been singled out by any stockholder and compelled to make good the entire loss caused by the willful and corrupt misconduct of a hostile board.

If this construction must obtain, then no man with any property or character to lose will be willing to serve as a director of a California corporation after it becomes known that the Constitution contains such a provision. I do not think, however, that the construction contended for can be allowed. It does seem that it was the intention of the framers of the Constitution to make each director of a corporation severally liable, whether individually culpable or not, for certain kinds of losses to the corporation occurring during his term of office. That is to say, he is made liable for embezzlement or misappropriation of corporate funds by officers of the corporation. In my opinion the word "misappropriation" is to be construed by the maxim *noscitur a sociis*; it means something like embezzlement, or, in other words, it means the misapplication of funds intrusted to an officer for a particular purpose, and does not apply to the payment of an extravagant price for services or material properly appertaining to the business of the corporation—which is this case. For losses occasioned by such means the law affords an ample remedy, without the need of resorting to the Constitution against those who are justly responsible, whether by reason of fraud or negligence; but the law does not in such cases visit upon the innocent the sins of the guilty, and if the liability arises from negligence the action must be commenced in two years after it accrues, whereas, if it arises out of fraud it may be commenced at any time within three years after the discovery of the facts. In this case, if the directors had been sued for negligence only in paying too much for milling the ores, the statute of limitations would have been a complete defense as to some of them, and a partial defense as to others. For

Concentrates.

A MINER'S UNION has been formed at Rossland, B. C. It is a $3 camp and young.

THE Bullion-Beck (Utah) will distribute no dividend this month nor next month.

WM. CLAYPOOL, of Prescott, Arizona, has bought the Cleveland mine at Chapparel for $15,000.

L. SEINOR of El Dorado has a contract to sink the shaft at the Gwin mine 250 feet at $18 per foot.

THE Bodie *Miner* says that J. Cain will erect a 100-ton cyanide plant on Booker Flat next spring.

THE Osborn Hill mine, Nevada Co., will not be shut down, as rumored, but will be still further developed.

THE company that owns the Snowshoe group of mines will build a 100-ton concentrator near Libby, Montana.

J. B. MOFFITT, of Stockton, will operate ten of his machines for reducing refractory ore in Deadwood, South Dakota.

THE 30-stamp mill on the Hayward & Lane mine, near Juneau, Alaska, is finished. Fifty Californians built it.

THE Byron N. White Company has decided to erect a concentrator for the Slocan Star mine, Slocan district, B. C.

THE steam dredger and boat for the Brown's Valley Mine Company have been successfully transported to Marysville.

J. C. DAVENPORT, of Spokane, Wash., has bought the Homestake mine at Rosslund, B. C., for $35,000, paying $3000 thereon.

THE Scieffard mine, at San Andreas, Calaveras Co., has been bonded by San Francisco men for $20,000, for forty-five days.

KISE BROS. are having a dredge built at Redding, patterned after the Diestlehorst dredge on Middle Creek, for use on Trinity river.

THE Utica mine is being pumped out at the rate of 60,000 gallons an hour, and it is thought the lower levels will be dry in ten days time.

THE report of the Denver branch mint for July accounts for the receipt and treatment of $573,017.80 in gold, compared with $737,501 in July, '94.

DURING July the United States Assay Office at Helena, Montana, handled $285,000 worth of gold. During July, '94, $188,500 was handled.

A 100-TON concentrator is to be built at Nelson, B. C., to treat the Silver King ore. The machinery has been ordered from Fraser & Chalmers.

IF Mr. Burton of Boston, Mr. Houlahan of Chicago and Mr. Tefts of Sacramento combine forces, electro-metallurgy may be given considerable impetus.

IN a column editorial the Virginia *Enterprise* asserts that the suit of Spring against Supt. Lyman of the Con. Cal. & Va. is simply spite work and blackmail.

GOLD deposits have been found near Bokhara by M. Portorsky, a Russian Government mining engineer, which, he asserts, are practically inexhaustible.

R. F. L. HALLOCK is about to operate at the historic Jones Bar on the Yuba, and has reason for belief that he will strike good gravel deposit above the old bar.

J. B. MOORE, of Oakland, has a dry washer in operation three miles above Cool, near the Georgetown road, on Five Cent hill, Greenwood mining district, El Dorado Co.

UNDER date of the 30th ult., J. B. Sellier writes from Bath, Cal., that the tunnel being run by him is on the New Treasure, and is in no way connected with the Mountain Chief.

P. FAGAN has bonded the Mechanics mine, Sutter Creek, to Valentine Bros. of this city for $12,000, payable Oct. 1st, '95, May 1st, '96. Machinery will be put thereon and development work done.

THE San Francisco Mining Company has incorporated in this city with $1,000,000 capital stock. Shareholders: A. Meyer, $500,000; J. M. Nougues Jr., $499,850; Joseph M. Nougues, E. L. Lowe and B. Vale, $50 each.

THE holders of the controlling interest in the Mercur (Utah) Gold Mining & Milling Company, and as many others as might desire to unload, recently refused an offer from Captain De Lamar on a basis of $1,000,000 for the mine.

UNDER date of August 3d, our Picacho, San Diego Co., correspondent writes that the American Girl mine at Cargo Muchacho has been sold for $120,000. It was bought, with three other claims, a short time ago for $5000.

H. H. WALKER, one of the auditors of the Canadian Grand Trunk Railway and secretary of the American Development and Mining Company, was suffocated by foul air in one of the company's mines near Whitehall, Montana, last Sunday night.

AT last Monday's meeting of the Debris Commission M. Cortez was granted a permit to operate the Sailor Boy hydraulic mine in Sierra county. Impounding dams were authorized at Big Ravine, Nevada county, and Lost Camp, Placer county.

SENATOR GLEAVES tells the Redding *Free Press* that this month the Altoona mine at Cinnabar "will produce 728 flasks of quicksilver at a net profit of $35 per flask, or $25,480," which seems a trifle exaggerated, both in quantity and amount.

THE Red Star Mining Co. is building a dredger 18x60 feet, "embodying the best features of five different mining processes," equipped with pumps and piping to dredge to the depth of 100 feet, to operate on the Snake river below its confluence with the Payette.

THE powers of the multiplication table are being taxed to exemplify the aggregate amount of gold in the ocean which gentlemen from New Hampshire and Indiana propose to extract. There is about a grain of gold to a ton of seawater. The gold is there all right enough; to a Californian it looks like a low grade proposition; very low.

AT the Witwatersrandt, South Africa, in a month's work, 2400 stamps, working night and day, crushed 265,716 tons of stone, yielding 119,114 ozs. 16 dwts. gold; while 43 cyanide plants treated 221,698 tons of tailings for a recovery of 52,099 ozs. bullion, valued at £156,461. The average yield of gold per ton from the mills was 8.96 dwt., and from the cyaniding 4.70 dwt.

NEXT week the Golden Cross Mill and Mining Company, at Ogilby, will start up a 60-stamp mill having a capacity of about 200 tons a day. The same company intends putting up another 40-stamp mill as soon as they get the new 60 stamp one going. With these two new ones they will have altogether 140 stamps, which will give them a capacity of over 400 tons of ore a day.

IN a recent decision in the case of the Louisa Mining Company, on appeal from the Marysville land office, it is held by the Commissioner of the General Land Office that to show discovery of mineral to comply with the prior decisions there must be a discovery in each twenty-acre tract embraced in said claim. As the mineral claim at technically failed to do so, the application was cancelled.

THE company organized by G. J. Atkins to work placer ground on the Columbia river above Revelstoke has had a force of men, under the direction of "an expert from New New Jersey," prospecting the ground for over two months. Whether the ground will be worked on a large or small scale depends on his report. Mr. Atkins and his associates have spent about $100,000 prospecting the ground.

THE Broken Hill Proprietary Co., Limited, of Australia, reports: "Profit for the half-year to May 31, £345,000; value of ore extracted, £3 3s 9d per ton; cost of production, £2 1s per ton." The company reports that for the week ending July 18, 8294 tons of ore were treated, yielding 606 tons of lead, containing 173,799 ozs. silver; also 1638 tons treated by amalgamating and leaching plants, producing 16,895 ozs. silver.

THE contest of E. O. Roberts, quartz claimant, versus B. Pendola, placer claimant, has been decided in the Sacramento land office in favor of the former. It involved about seven acres of ground, claimed within Pendola's location. The question at issue was whether at the date of the placer application in November, 1892, there was a known gold-bearing quartz lode thereon. The ground adjoins the Kennedy on the east.

FROM the last number received of the Melbourne *Argus* the following is taken:

> TO INVESTORS AND OTHERS.—Gentleman possesses reliable and valuable information re gold mine, whose shares can now be bought cheaply. In month's time will have 200 per cent rise. Enclose fee £1 in application. Write for information to ———

Cheap enough! The wonder is that a respectable paper would aid such a swindle.

THOMAS G. MERRILL, president of the Montana State Board of Mineral Land Commissioners, has made a statement in reply to the report from Washington as to the cost and alleged dissatisfaction with the classification of mineral lands within the Northern Pacific grant by the Government commissioners. He declares the statements of Commissioner Lamoureux to be gross misrepresentations and without foundation in fact. Instead of costing the Government 25 cents per acre for classification, the actual expense so far has been 1 1-5 cents per acre, and the work has been eminently satisfactory to the people.

RECKONING fine gold at $248 per pound troy, there are seventeen metals said to be more valuable, viz.: Iridium, valued at $300 per pound troy; gallium, $375; rhodium, $425; osmium, $600; ruthenium, $1000; palladium, $1080; barium, $1400; didymium, $2500; cerium, $2600; yttrium, $3150; strontium, $3350; calcium, $3500; glucinum, $4100; lithium, $5100; zirconium, $5575; rubidium, $7000; vanadium, $8625. Osmium, with a specific gravity of 22.5, is the heaviest known substance; while lithium, with a specific gravity of 0.59, is the lightest metal known, and will float in the lightest known fluid.

A SHASTA, CAL., dispatch says that two men who have been prospecting on Trinity mountain for the past month found a pocket a few days ago near the foot of the mountain, twenty-five miles from there and about midway between Shasta and Trinity Center, which contained $11,200 in gold dust. That beats the "$140,000 to the ton" of sylvanite found by W. S. Stratton's men at Victor, Colorado. Some of the old Shasta residents living believe the gold found at the foot of Trinity mountain was buried there by robbers who in early days robbed Wells, Fargo & Co. frequently in the neighborhood of the find.

THE Montana Supreme Court has affirmed the decision of the lower court in the case of Chas. Kelly vs. the Fourth of July Mining Company. This suit hinged on the question whether a mine owner or his representative is supposed to furnish and sufficiently and safely timber a tunnel of a mine being worked, or whether the miner is to look after his own safety in that regard. The plaintiff, on May 27, 1891, was rendered helpless for life by the alleged negligence of the defendant in not properly timbering the tunnel, a quantity of dirt and rock falling upon him in consequence. He sued for $50,000, and was awarded $15,000 damages.

IN the Transvaal, South Africa, two railway companies have been building from Delagoa Bay and Durban, in Natal. The first-named and shorter line, the Netherlands South African railway, which is an extension of the Delagoa Bay and East African railway, to Pretoria, was finished July 8. The distance is about 350 miles, while the competing line under construction from Durban, and to be finished in a few weeks, will be a little longer. The new road, like all South African railways, is of three-feet gauge. The Johannesburg region was already reached by rail from Port Elizabeth, on the south coast, a distance of some 730 miles, and from Cape Town by the long journey of 1030 miles, but the completion of the direct line from the east coast will greatly facilitate development. Several branches are under way into the gold fields.

THE Yreka *Union* is publishing two notices from land office at Redding notifying the public generally that the C. P. R. R. Co. has applied for a patent to lands in township 39 north, range 1 east, township 39 north, range 1 west, township 39 north, range 2 west, township 31, 46 and 47 north, range 5 west, township 30 north, range 6 west, and towaships 30 and 44 north, range 6 west, all of Mount Diablo Meridian; also in township 43 north, range 9 west, and township 47 north, range 10 west, all of Mount Diablo Meridian. Within the next sixty days following the date of the notices, Aug. 1, protests or contests against claim of the company to any tract or subdivision described in the list, on the ground that the same is more valuable for mineral than agricultural purposes, will be received and noted for report to the General Land Office at Washington, D. C.

Cheap Ocean Transportation.

(*Continued from page 85.*)

structure. In addition to this a hulkhead of heavy timhers was placed on each end of the raft and kept tightly in place hy heavy steel cables running through the raft from oue bulkhead to the other. It contains ten thousaud logs of various sizes, ranging in length from thirty to seventy-five feet. The logs contained in this raft are of small diameter and are mostly pile timber. They will he used principally in the construction of wharves aud piers in and about the Bay of San Francisco. The quantity of timher contained in the raft is four hundred thousand lineal feet, the equivalent in board measure of about six million feet. The raft is thirty feet in depth, and draws hetween twenty and twenty-one feet of water. The logs contained in it, if placed end to end, would reach a distance of seventy-six miles. The total weight is estimated at ten thousand tons. At the usual rates the freight bill would he over $21,000. Towed down in hulk the whole expense of trausportation from Astoria to San Francisco will not he over $1500. The whole thing—lumber, chains, cost of constructiou, and everything—cost $37,500 as it lies at Alameda Point.

Capt. Pillsbury kept a log of his trip, and reports a smooth sea and a light, southerly breeze, with clear weather all the way down. He had 190 fathoms of rope aud 70 fathoms of chain on the tow, kept four lights on the raft at night and two men on it in the daytime, and had uo fears of the result. The Mineola, which hrought the raft through in safety from start to finish without extra aid or help, is 275 feet over all, 37 feet heam and draws 20 feet of water aft.

The economy of such a proceeding is obvious. Apart from the great saving in freight, there is a saving in material. The slabs, edging and other waste, which in northern ports can hardly he given away, are here valuahle for firewood and can he sold for more than enough to pay for hringing down the whole consignment. The lumber can be sawed here, affording employment to that many more, and the manufactured product furnished city consumers at a cheaper rate than ever hefore.

FILLING CRADLE WITH LOGS—RAFT ABOUT HALF BUILT.

South African Gold Output in 1894.

The report of the Minister of Miues of the South African Republic for 1894 gives the official figures of the gold yield of that extensive State for '94, together with a mass of interesting statistical iuformation regarding the South African mining industry. The gold yield of the several districts is as follows:

	Ounces.	*Value.*
Witwatersrandt	1,949,939	£6,718,168
De Kaap	87,483	298,598
Klerksdorp	78,358	264,724
Lydenburg	60,276	173,275
Heidelburg	52,685	172,340
Zoutpansberg, etc.	11,134	40,017
Grand total	2,239,865	£7,667,152

The De Kaap field milled 95,443 tons of quartz, yielding 46,603 ounces of gold, valued at £175,239, or 0.49 ounces per ton. The average value per ton of milled ore in the Klerksdrop district was 17s 2d. From the Lyndenhurg 63,968 tons of quartz crushed yielded 32,452 ounces, valued at £111,242, or ahout £1 14s 9d per ton. By the cyanide process 29,496 tons of tailings, having an assay value of 0.53 ounce per ton, gave bullion worth £56.772, or an average of about £1 8s 9d per ton; 1490 ounces were ohtaiued from alluvial. The average assay value per ton of the gold ohtained from the Heidelburg gold field was 1.093 ounce, or £3 16s 10d. Tbe tailings gave an average value of £1 11s 1d per ton. The Randt yielded 88 per cent of the whole.

The number of companies is 141; capital, £24,702,815; cash supplied, including payments to promoters, £7,869,811, or 34.3 per cent. The following shows the importation of machinery for '93 and '94:

	1893. *Horse Power.*	1894. *Horse Power.*
Steam engines and lighting, turbines, etc.	25,299	26,219
	Value.	*Value.*
Steam engines and lighting, turbines, etc.	£ 769,069	£1,079,314
Hoistiug, pumping, compressing machinery	222,930	316,495
Tramways, elevators, etc	227,605	223,580
Workshops, etc	33,046	60,766
Reduction machinery, mills, crushers, vats, etc	1,376,217	1,690,190
Total	£2,627,816	£3 370,345

The total gold production in 1894 was 2,239,865 ounces, worth £7,667,152—an increase over 1893 of £2,186,654. or 39 per cent. Of this 68 per cent, or 1,457,103 ounces, were ohtained from milling operations, and the rest by cyanide treatment of tailings and concentrates. The tonnage of ore milled was: 1893, 2,482,159 tons; 1894, 3,269,462 tons, or an increase of 787,303 tons, equal to about 31 per cent. In the latter year 4991 stamps were at work, having an average weight of 834 pounds each. The average crushing for each stamp every 24 hours was 3.63 tons, and the yield therefrom 0.446 of an ounce of gold, valued at £1 12s. 1d. From tailings 694,625 ounces of gold were obtained, of the value of £2,091,730, or 27.3 per cent of the total output. The average assay value of this residue was 0 255 ounces of fine gold, and worth ahout £1 1s. 3d. per ton. Of the total quantity of tailings treated 3,048,798 tons were by the MacArthur-Forrest process and 30,757 tons hy other methods. Concentrates yielded 84,471 ounces of gold, valued at £318,909, or 4.1 per cent of the total yield. The average assay value of the concentrates of the Witwatersrandt conglomerate heds was 3.16 ounces; that of the quartzite heds of Barberton 6.09 ounces; 13,060 tons of ore, of an assay value of 4.41 ounces fine gold, equal to £18 7s. 10d. per ton, were treated hy the chlorination process, yielding gold to the value of £17 15s. 6d. per ton of ore, or ahout 96.6 per cent of the gold contained; 11,341 tons of concentrates, of an assay value of 2.29 ounces of fine gold, worth £9 11s. per ton of ore, treated by the cyanide process, yielded bullion to the value of £7 12s. 7d. per ton, or 79 per cent of the assay value. The yield from alluvial was about 3666 ounces, valued at £12,806, or 0.2 per cent of the total output.

The output for nine years is showu in the following table, supplied by the report:

Year.	*Ounces.*	*Increase.*
1886	10,632	8,925
1887	48,960	38,928
1888	279,600	230,640
1889	430,800	151,200
1890	540,360	190,560
1891	835,516	295,156
1892	1,389,498	553,982
1893	1,575,397	585,899
1894	2,239,864	664,468

A gross total of 7,254,683 ounces.

The Harqua Hala Mines.

To the Editor:—The Harqua Hala mines, well known as the greatest gold producers in western Arizona, are in honanza again. The rich strike lately made continues to widen, lengthen and improve as it is opened, and shows that the late Geo. W. Bowers, of San Francisco, one of the late owners, was right when he said: "Go in on that 200-foot level and you will strike the richest and largest hody of ore ever fouud in the Bonanza mine," but the experts and mining engineers differed, aud they sunk here and there, hut to no purpose, when finally the news came that the mine was played out and would be closed down. All but a few of the men were discharged and it looked as if the Bonanza mines were things of the past.

The new manager, hearing of the saying of Bowers, took the idea and went to work on the 200-foot level, with the result of finding what appears to be the hest hody of ore ever discovered in the mine. Forty sacks of the ore yielded $40,000. Men now stand guard over the ore piles; the miners are carefully watched as they leave their work, all going to show that the ore is very rich.

The Eugasser mine, lying a little east, is also turning out very rich, being in very rich ore at the bottom of the 200-foot shaft. The owners will put up a 90-stamp mill at once.

The Thomas mines, fifteen miles southeast of Yuma, bonded for $150,000 uutil October, are holding out well, with the chances now that the sale will he made.

The ore in the Estrella and Silver Prince mines, twelve miles northwest of Picacho, in the old Picacho mining district, owned by Guadalupe Martinez, is turning out good, carrying 25½ ounces of silver, $5 in gold and 35 cents in copper. The mines are ahout eight miles south of the Colorado river. The Gatanal canyon, which they cross, was rich in placer gold. They are within a mile of a great teuaja of water, which is permanent. The outlook for Yuma county's mines never was more promisiug.

Yuma, Arizona, July 28, 1895. E. M. G.

The Trenton Iron Works has made a contract with the Cataract General Electric Company for the construction and equipment of an experimental line of four miles for towing boats on the Erie canal by means of electricity. The electric power is to be taken from the Niagara Falls Power Company and the line is to be huilt at a point to he designated hy the superintendent of puhlic works in the vicinity of Tonawanda. The line is to he completed and ready for operation within sixty days. The cost of the system will be $2500 for a single mile, or $5000 for a line on each side of the canal. The equipment of the Erie canal will involve an expense of $20,000,000.

The report of the Geological Survey for 1894, discussing chromic iron ore, says "the entire product comes from California. The product of 1894 was more than douhle that of 1893, but the price remained nearly stationary at $15 per ton; 3680 long tons were produced." Chromic steel in relation to armor and armor piercing projectiles is very fully discussed. It is stated that the chromium does not itself increase the hardness of steel, hut iu combination with other suhstances gives it a superficial hardness equal to that of the Harvey process.

The successful use of electricity as a motive power on steam roads has led the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Company to effect a comhination for the development of apparatus for the operation of steam railroads hy electricity.

Electrical Mining Plant.

The value of electricity in mining operations is no longer disputed. In the coal industry especially it has been received with favor, and in these days, when working expenses must be reduced, electricity has been found to offer to mine operators a means whereby great economy may be effected. The advantages which follow the adoption of electricity in coal mine operation are that it presents a system of the greatest simplicity, completeness and flexibility, permitting power from one source to be distributed in units of any desired size and for any purpose to the places where it can be employed to the greatest advantage, thereby securing the minimum consumption of power and expenditure of labor. With electricity there is neither friction, heat nor condensation. There is no leakage nor loss of power when not in use, which especially recommends it for intermittent work. It is not affected by heat or cold, and does not vitiate the air, as is the case with steam and compressed air. The rapid deterioration of timbering, a source of great expense in all mines, due to bad air and heat, is also to a great extent obviated.

An excellent example of coal mine operation is the electrical installation at the Mount Lookout colliery, at Wyoming, Pa., where locomotives, pump and drills are being successfully and economically operated by electricity.

This plant was installed by the General Electric Company, and all the electrical apparatus employed is of its manufacture.

The source of power is a McEwen high-speed engine, making 218 revolutions per minute. It is located in the power house—a brick building some 200 feet from the main shaft, and about 100 feet from the air shaft. Belted to this engine are two multipolar General Electric generators, one of 100 K. W. (135 H. P.) capacity, the other of 20 kilowatt (28 H. P.) capacity. Haulage, drilling and pumping in the mine are operated by current from the larger generator, while that from the smaller is taken for the incandescent and arc lighting circuits on the surface. In case of accident to the larger generator, the current from the smaller one can be utilized for power purposes.

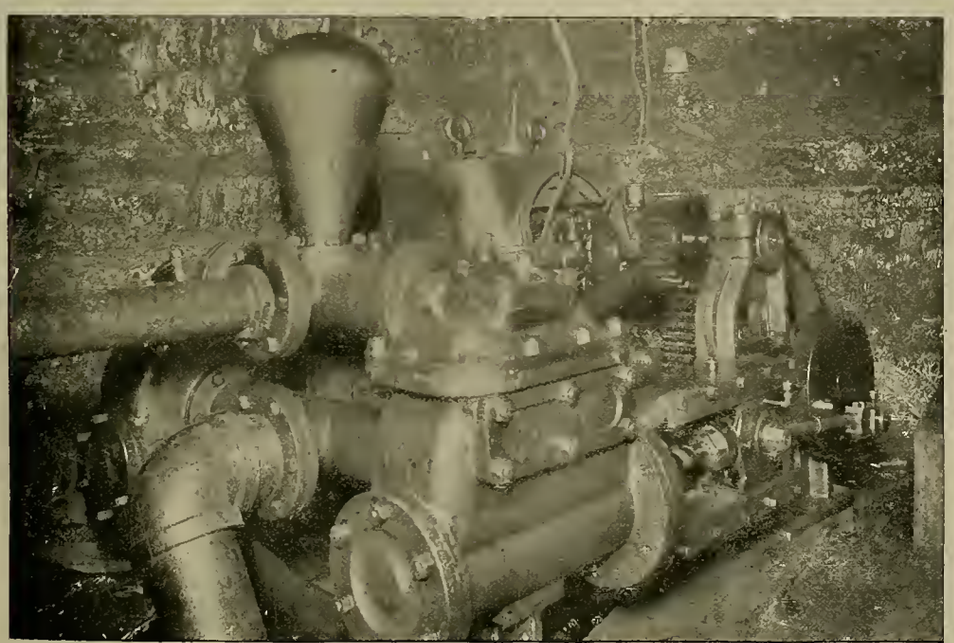
From the two skeleton switch-boards in the power house the circuits are led, one to the surface, the other to the mine. The office, engine and boiler houses are lighted by incandescent lamps; the breaker and surrounding grounds by 2000 C. P. arc lamps.

The conductors for the mine operations are strung 300 feet down to the bottom of the air shaft, and consist of lead-covered cables for the feeders and returns. The feeders are carried along the main gangways parallel to the trolley wire, or through old workings or airways. The feeders are waterproof rubber-covered copper wires strung on insulators attached to roof blocks.

At the bottom of the shaft the feeders divide, one branch supplying current to the north workings, the other to the south workings. No. 0 hard drawn wire is used for the trolley wire, the rails being bonded for the return. The trolley is suspended from oak roof blocks by a special mining ear which clamps the wire but is not soldered to it.

Haulage in the north workings is effected by one electric locomotive, which weighs about 6½ tons, equipped with two single reduction waterproof motors. It has a draw-bar pull of 1500 pounds on the level at six miles an hour, while at starting it will exert a pull of 3500 or 4000 pounds without slipping the wheels. The extreme dimensions of this locomotive are 11 feet 4 inches long, 57 inches wide and 34 inches high. The total length of the gangway over which it operates is about 2800 feet, although, including sidings and turnouts, about 3000 feet of trolley wire is suspended in the north workings. The locomotive makes between 20 and 25 round trips per day. It is hauling at present seven loaded cars, but is capable of easily handling twice this number The grades vary from the level to 2.8% and all are against the empties.

Haulage in the south workings is effected by a locomotive equipped with two single reduction mo-



ELECTRIC LOCOMOTIVE IN WORKINGS.

MAP OF MINE.

ELECTRIC DRILL.

ELECTRIC PUMP.

tors, and having a draw-bar pull of 2500 pounds on the straight level at a speed of six miles an hour. At starting, however, it can exert a draw-bar pull of 4000 to 5000 pounds without slipping the wheels. The total weight of the machine is about ten and a half tons. It is 11 feet 4 inches long, 58 inches wide over all and 34 inches high. The maximum run made by this locomotive is about 1200 feet, and the length of the wire used, including turnouts and sidings, is about 1800 feet. At present this machine is hauling ten cars and making from 40 to 45 round trips, pushing in the empties and hauling out the loaded cars. In starting from the entries, *F*, *G*, *H* and *I*, where the trips are made up, the locomotive does its hardest work, as there is a sharp grade and curve against the loaded cars. Each mine car empty weighs 3000 pounds, and loaded 8000 pounds.

The south workings haulage line is to be exteuded from *H* to *K*, and through a rock tunnel to *L*. The branches, *F*, *G* and *I*, will then be abandoned and the locomotive will then operate over about 3500 feet, hauling 400 cars per day from the head of the rock tunnel at *L*.

The electric pump is situated in the workings off the branch *I*. It is a standard duplex double-acting piston Knowles pump, operated by a General Electric motor, and has a capacity of 300 gallons of water against a 40-foot head. The piston speed is constant, and should the water fall below the mouth of the suction pipe the pump does not race. This pump has been in operatiou for more than a year, working twenty-three hours a day. It requires no attention, except at starting and stopping, and an occasional oiliug.

The General Electric rotary coal drills are also in the southeast workings of the mine. These are run from a circuit taken from that connected with the feeders in the main gangway. The length of this is about 1400 feet. The drills are working a three-foot seam of coal and taking up two feet slate bottom. They make about six feet per minute, with au iuch and a half bit, in the coal, and four feet per minute in slate or "boney."

Since this electric plant was started it has operated without hitch or accident. Its installation has induced a decided economy in the operatiou of the mine, and is exciting considerable interest among coal operators, to whom is stands as an object lesson in the economical operation of mines.

The Hale and Norcross Decision.

(*Continued from page 87.*)

these reasons I think the directors other than Levy are entitled to a new trial of the whole issue.

Objection is made to the right of the plaintiff Fox to maintain the action upon the ground that the findings and evidence show that he made himself a stockholder after the occurrence of the injuries complained of, for the express purpose of bringing this action; that he acquired but a small amount of stock at that time, and that he never had any substantial interest in the corporation at any time.

The finding of the Court is, however, that he was at all times a stockholder, and as this finding is not attacked in the specifi ations of grounds in tbe statement on motion for a new trial we cannot look at the evidence; and in construing the finding we must hold that it means that he was a stockholder in a substantial sense.

Objection is made to the form of the judgment or judgments, upon various grounds, but these are objections which should have been made to the complaint on tbe ground of misjoinder, etc. I think the objectiou to the several judgments on account of their mere form comes too late. In form they follow the complaint, and if the several judgments had been for the respective amounts for which the defendants were liable, the form in which they were entered would have afforded no substantial ground of complaint.

In view of these conclusions upon the main points in controversy, most of the other assignments of error became immaterial, and, so far as the points not herein particularly discussed seem likely to arise upon a new trial, I see no substantial error calling for discussion.

To summarize the above views my conclusion is that the record sustains, or fails to sustain, the finding and conclusions of the Superior Court in the following particulars:

First—That the defendants, Hayward, Hobart and Levy, formed a fraudulent combination and agreement for mining and milling the ores of the Hale & Norcross Silver Mining Company, but that the other directors of the mining company were not parties to this agreement, but were merely negligent in the performance of their duties, and are therefore chargeable with only such negligence, and are not chargeable with any actual fraud.

Second—That the Mexican and Nevada mills were under the control of Hayward, Hobart and the Nevada Mining and Milling Company, but it is not shown that the Nevada mill was under their control.

Third—That Hayward, Hobart and Levy, with the acquiescence and consent of the officers of the Hale & Norcross Company, controlled the affairs of that company.

Fourth—That Hayward, Hobart and Levy, in pursuance of their agreement aforesaid, caused a quantity of inferior and worthless ores to he extracted from the mine, and to be milled after being mixed with ores of a higher grade.

Fifth—That the Hale & Norcross Company paid $7 per ton for milling said ores; that the actual cost of milling the same was but $4.50 per ton; that by reason of their fraud aforesaid the said defendants were entitled to receive only the actual cost of milling said ores; that by reason of having been required to pay $7 per ton for milling said ores, the Hale & Norcross Company has sustained damage in the amount of $210,197.50.

Sixth—That the evidence is insufficient to sustain tbe finding of the court that the Hale & Norcross Company sustained damage by reason of the imperfect milling of the ores in the amount of $789,618, and that the actual amount of damage sustained thereby cannot be determined from the findings of the court.

Seventh—That the Nevada Mill and Mining Company, not having been served with process, was not before the court as a defendant.

The cause is, therefore, remanded to the Superior Court with the following directions, viz.: The judgment appealed from is set aside and the Superior Court is directed to enter a judgment as of the date of its former judgment, against Alvinza Hayward and H. M. Levy for the sum of $210,197.50, with interest from that date, upon the issue presented by the claim for having paid an excessive price for milling the ore in the Mexican and Nevada mills, and upon that issue the order denying a new trial as to these appellants is affirmed. As to the other appellants, except the Nevada Mill and Mining Company, the order denying a new trial as to this issue is reversed, and a new trial thereon ordered. Upon the issue presented by the claims for damages sustained by reason of the imperfect and fraudulent milling, the order denying a new trial is set aside as to all the appellants, and the court is directed, upon the evidence already taken in the case, and such other evidence as may be presented by either party, to make findings in accordance with the views hereinbefore expressed. Upon the amount, if any, of such damage sustained by the Hale & Norcross Company, in addition to finding the value of the ore delivered to the mills, the court is directed to find the amount and value of the bullion that should have been returned therefor. The court should also find what amount of this value of the ore delivered to the mills was necessarily lost in the working, or would not under fair milling be separated from the baser matter; and also the amount of money, if any, received by the mills from the working or sale of the tailings or residue of the ores.

Until the Nevada Mill and Mining Company has been brought before the court, the court will make no trial of the issues against that company. BEATTY, C. J.

We concur:

HARRISON, J.
VAN FLEET, J.
HENSHAW, J.
TEMPLE, J.
McFARLAND, J.

Justice Garoutte concurred as follows:

I concur in that portion of the judgment which is affirmed; but dissent from the opinion of the Court wherein it is held that the evidence is sufficient to support the finding of fact to the effect that 74.6 per cent of the car sample assay is a fair return to the Hale & Norcross Company.

This actual return to this mining company by the milling company was but 52 per cent of tbe car sample assay. This was not enough. No argument or citation of facts is necessary to prove it. Everybody knows it. But the all-important question is: How much bullion in excess of this 52 per cent should have been returned to the mining company under the evidence found in this record? There is the rub. Mr. Lyman, superintendent of the Consolidated Virginia mine, and one of the principal witnesses for the defense, stated that he would hope to get a return of 65 per cent of the car sample assay. And if I had been the trial Judge upon this and other evidence introduced I should have recognized the justice of a return to the mining company to that amount at least. But the true rule to be invoked by a Justice of this court in determining the sufficiency of the evidence to support a finding of fact made by a trial court is not what such Justice would have done upon the evidence, if sitting as a trial Judge, but, rather, is there a substantial conflict in the evidence? And the question of the presence of a substantial conflict is in no way dependent upon the great number of witnesses upon the one side and the limited number upon the other, for it is often the case that one shall prevail against the many. For the foregoing reasons and many others unnecessary to detail in a case like this the finding of a fact by a trial court should not be set aside without the soundest and most convincing reasons. The opposite conclusion should be so plain that a mere statement of the evidence would indicate it. It should not be necessary to resort to an elaborate and complex analysis of the evidence in detail to prove it.

The witness Holden testifies that the mining company should have had a return of 85 per cent upon the basis of the pulp sample assay. If we allow a variation of ten per cent between the car sample assay and the pulp sample assay, then, under the testimony, there should have been a return to the mining company of about 76.5 per cent of the car sample assay. It is attempted to reduce this percentage by a claim of allowance or discount for moisture and evaporation. There appears to have been but little importance attached to this question of moisture during the progress of the trial, and all indications point to it as somewhat of an afterthought. But, however that may be, I think slight reduction would satisfy its claims, and in view of this testimany, taken in connection with that of Mr. Mackay and others, I think there is sufficient evidence in the record to support the finding which the majority of the Court hold to be without support.

Near the Equator.

W. H. Adams, of Grass Valley, has a letter from his brother, Jas. B. Adams, who with three or four companions are working for the Playa de Ora Mining Co., in Ecuador, S. A., 200 miles back from the seacoast. The mine is three degrees from the equator, and they suffer the discomforts of heat, tornadoes and insect pests. At times the rainfall reaches teu inches in an hour, the streams rising twenty feet within a short space of time. The insects are prodigious in size and continuous in their operations. Vampire bats stealthily alight upon a person in deep slumber, inserting their beaks and gorge themselves with his life blood. There is also miasma in the atmosphere, and fever prevails. Nothing but liberal salaries could tempt civilized people to remain under all of these discomforting conditions. The miuing operatious are superintended by educated and experienced white men, while the heavy manual labor is done by the natives at very low wages. Besides Mr. Adams, Edwin Ryan of North Bloomfield is foreman at the Playa de Ora. Wm. Daws of Nevada City is located at another mine, three miles distant. Mr. Blodgett, a former foreman of the mine, is on the way home to Nevada City. Five miners from Sierra county have lately arrived in the same country. The ore taken from the Playa de Ora is very rich and pays the owuers large dividends.

C. W. BALDRIDGE tells the people of Humboldt county that if they will give him $500,000 county bonds, drawing five per cent interest and running twenty years, the Cal., Oregon and Idaho Railway Company will build a standard-gauge road from Eureka to Red Bluff in three years' time. The project is favorably received.

THERE was a strike at Trail Creek, B. C., last week for an advance of wages from $3 to $3 50, but after two days the miners resumed work at the former figure. A Miners' Union recently formed has a present membership of 275.

Coast Industrial Notes.

—Birce, Smart & Co., of Emigrant Gap, have a contract to furnish 500,000 feet of lumber to the Electric Power Company of Nevada City.

—Local capitalists contemplate the generation of electric power by water from the debris dam proposed to be built by the Government at Deguirre Point near Marysville.

—San Bernardino now has three furniture factories that will soon turn out ten carloads of furniture a month. The wood used by these factories is native mountain pine.

—The steamer Columbia, improved and refitted at an expense of over $200,000, has left the dock at the Union Iron Works, and will shortly resume transit on the northern route.

—George B. Kerper, owner of the San Diego Cable Railway, is credited with intention to change the system to electricity and extend the line four miles to National City, making the total length eight miles.

—The Monrovia Electrical Power Company has ordered a steel pressure pipe and a water wheel of 100-horse power capacity, and other necessary machinery. A wire will be run to Arcadia, and, possibly, to Duarte.

—The American Power and Tide Wheel Company has incorporated; capital stock, $900,000; actually subscribed, $1000. Directors—C. Boone, M. S. Leve, A. H. St. Marie, R. M. Clements of this city and D. E. Alexander of Sacramento.

—The State Bureau of Highway Commissioners expects to be ready to deliver crushed rock from Folsom within ninety days at 67½ cents per cubic yard, delivered on the cars at Sacramento. The present price of crushed rock is $2.95 per cubic yard.

—Among unique "coast industries" may be mentioned the tarantula traffic. A Pasadena paper says over 50,000 tarantulas were shipped from that place last year to meet tbe demand of the tourist traveler, and it is estimated that in the last five years over 200,000 spiders have been sold.

—Salt Lake men want the S. P. Co. to withdraw the California–Utah freight rates of the 1st inst., claiming that Ogden is favored thereby. The company claims that the Rio Grande Western and the U. P. are the ones blamable, and that the new rates are based on the desire to give California an equal show with Eastern shippers to Utah.

—The Oaxaca Coffee Plantation Company has organized; capital stock, $500,000; $140,000 subscribed; to grow coffee and other tropical products in the State of Oaxaca, Mexico, and purchase and operate a line of vessels. Incorporators—R. Pacheco, C. Halla, O. D. Greene, H. Hume, C. W. Kohlsaat, W. J. Russell, Eli Murray and L. R. Ellert.

—Work has been temporarily suspended on the Columbia River and Red Mountain road from Northport, Wash., to the Trail Creek mines, B. C., 14 miles, owing to a decision of the General Land Commissioner, which prohibits the road from crossing the Colville Indian reservation. The road has been completed to a point on the border of the reservation.

—One of the largest water systems in the State is in process of completion at Hemet, San Diego Co., where forty men are finishing a dam at an elevation of 4500 feet. It has cost, so far, $500,000. The dam is 150 feet in height, built of granite, and covers 720 acres with 100 feet of water, which is piped and flumed twenty miles under a pressure at Hemet of 95 lbs. to the inch.

—Active work has begun on tbe little line of railroad from Alviso, or "New Chicago," to San Jose, giviug a new line of travel from this city to the heart of Santa Clara Co. The chief present difficulty is the short-sighted action of some property owners most directly benefited thereby who want the company to pay them exorbitant right-of-way privileges which will make land valuable that is now comparatively valueless.

—When completed Arizona will have the largest reservoir in the world. The proposition is to dam the waters of the Gila river to a height of 200 feet on the face, in a high box canyon, which would be the means of impounding the water back for a distance of twenty miles. It is estimated that by this means sufficient water can be obtained to irrigate most of Pinal county, comprising several hundreds of thousands of acres. The estimated cost of construction is $2,000,000.

—The Los Angeles oil industry is assuming great proportions A new strike has been made in the city of Los Angeles of green oil on a paraffine base of a 28 gravity, the ordinary petroleum being 15, at a depth that indicates enormous deposits in the third sand stratum. It is now proposed in this city to bring Southern California oil here for use as fuel. A fleet of tank ships carrying crude oil from San Pedro to San Francisco would be a novelty, hut is a commercial possibility. It would seriously interfere with the coal importation business and necessitate in many manufacturing establishments a complete change in boiler furnace grates, etc. The idea is being actively discussed. It is a question of supply and demand, and if it be demonstrated that crude oil for fuel can be furnished the San Francisco manufacturer cheaper than coal, the change will be made, and will revolutionize present conditions and methods around the bay.

—J. B. Gorman, the United States consular representative at Matamoras, Mexico, reports a prosperous condition of affairs at that point in his report to the State Department. He says there has been a rapid growth of the commercial relations of Mexico with the United States. Crops of all kinds are more abundant than they have been for six years, while manufacturing has increased in every line. He also reports a marked increase in exports, due to the new tariff. Among the articles in which there was the greatest activity were wool, cattle and hides, and large advances in prices were realized. Mr. Gorman states that only about 26 per cent of the imported goods sold in Matamoras last year came from Europe, the remainder being received from the United States. The exports of fruit were largely increased in consequence of the Florida freeze. He thinks that a line of fast steamers on the gulf would soon bring the gulf coast of Mexico into permanent competition with Florida. Mr. Gorman also says the improvement of Aransas Pass will result in vast benefit to Mexico and southwest Texas.

—The Nevada County Narrow Gauge Railroad has thirty-two miles of road from Colfax to Nevada City. There are heavy grades and sharp curves, and the road makes eleven complete circles. Teams freight from Marysville for 25 cents a hundred. Before the railroad was built teams charged 50 cents. The railroad has to meet this competition. Some years ago four-horse teams could not be hired for less than $8 a day. Now they are satisfied with $3.50 or $4. Feed is cheap and teamsters are satisfied with making a bare living. Some people going to Grass Valley or Nevada City go to Auburn on the Central Pacific and from there travel by team. They save the fare between Auburn and Colfax, and from Colfax over the narrow gauge. The distance is much shorter by wagon road, and owing to the heavy grades and sharp curves, the teams make about as good time as can be made on the railroad. If the road was twice its length it would be a paying investment. In that case the teams would not be a competing factor. The original cost of the road was $500,000. Over $100,000 have been added since in improvements. The freight and passenger rates are one-half what their charter allows them to charge, being regulated entirely by the opposition freight lines and stages which ply between Grass Valley and Auburn, Colfax and Marysville.

Scientific Progress.

The Universal Force.

By Henry Raymond Rogers.

No object in the whole universe is more familiar to the eye of man than the sun, and at the same time there is none more deceptive and misleading, for it is not what it appears to be. Its heat and dazzle are mere superficial appearances. The evidences against our present system are abundant and clear.

Science to-day asserts and demonstrably proves to be true that the universal space in which the sun, moon and stars unceasingly revolve is inconceivably cold and dark—the black of infinite space. Science also asserts that sun heat and sun light are due to the same causes and subject to the same laws. Thus sun light diminishes in the direction of the sun in the same ratio as sun heat.

The sun, surrounded by such cold and darkness, cannot emit, or radiate, a single ray of actual heat or light. The sun, therefore, can send forth no dazzle. Then what is this dazzling brightness which appears so real, and which is so largely due to the sun's action? There is an explanation that is clear and satisfactory. Mighty currents of force come from the sun invisible and free through the 93,000,000 miles of cold and darkness of space, and awaken our atmosphere to heat, light and power. These currents pass through the void of space instantaneously and incessantly and do not manifest either heat or light until they come into conflict with our atmosphere. Through the resistance offered to the progress of those currents by the atmospheric mass both currents and atmosphere become aroused to activity and heat, light and power thereby become developed.

But where, it may be asked, is located the dazzle? But one explanation of this phenomenon is possible. That delicate but powerful little optical instrument, the eye, offers the only solution of this problem. The light thrown upon this subject by that little body now clears up this mystery and reveals the magnitude of former errors.

The eye is composed of a convex cornea, which, together with the iris and the contained aqueous humor, constitute a concavo-convex lens, through the action of which the sun's rays become converged toward the pupil and increased in power. At the pupil these rays fall upon the double convex crystalline lens and become intensified on their passage through it. From thence they pass through the concavo-convex vitreous body or lens and become diverged and distributed over the surface of the retina, with dazzling, blinding effects. Thus, in the depths of the eye, this dazzling brilliancy becomes developed, and not at the sun itself, not in the 93,000,000 miles of darkness of space, neither in our atmosphere. Out of the foregoing explanation of the sun's dazzle a whole philosophy of the sun and of the universe may be evolved. From its lessons we learn that the sun may be cool, dark and habitable, and the abode of life, intelligence and beauty, and yet the earth may be heated and lighted the same as now.

A cool, dark, habitable sun! What momentous words. What power and significance are embodied in this fact or principle of a cold, dark, habitable sun. But this lesson is lost upon science since it fails to recognize in such a sun one of the grandest of the sources of the universal energy. This principle, therefore, is revolutionary.

But what are those mysterious sun currents which we have found actually to issue from such a cold, dark, habitable sun, and which develop warmth in our atmosphere, turn our darkness into light, and dazzle the eye of the beholder?

The sun has its secrets, yet its secrets are simple, exceedingly simple. Its grandest secret is embodied in a single word, viz., *motion*.

The sun and stars were set in motion by some inscrutable process, and they have continued to move onward with their initial velocity, magnitude and power. The rule of science for estimating the power embodied in a mass of matter in motion is to multiply its weight in pounds by its velocity in feet per second. This law applies alike to worlds and cannon balls. The power of the sun and stars is thus determined by their mass and their velocities. Thus the earth's mass consists of 250,000,000,000 cubic miles of matter, moving with an axial velocity of 25,000 miles per day, and an orbital velocity of 1,500,000 miles per day, while the sun's mass is 1,250,000 times greater than the earth and moves with a velocity of rotation of 100,000 miles per day. What stupendousness of power is here represented. The universal force is thus abundantly accounted for in the energy of celestial motion. The sun, isolated in space and motionless, would possess no more power than a microbe. Then whence its energies? The earth is a magnet with a magnetic axis and poles. Inferentially the sun and all stars are magnets polarized in immensity. Thus the sun and all stars work electrically. The universal force, therefore, is demonstrably electrical. If the power of a magnet be judged by its dimensions, what electrical power must be embodied in the starry universe when a terrestrial magnet, constructed of two cannons, is found capable of holding up a mass of matter weighing five tons! Again, what stupendousness of magnetic power exists in the starry host.

But electricity is not a self-existent entity. In order to perform work it must be developed as required. It acts, passes on, and must be incessantly renewed when operating on the scale of the universe, the same as in the scale of the laboratory. It is a law of electrical action that when two bodies revolve on their axis near each other electrical currents become developed and pass from one to the other. This law acts on the scale of the universe in identically the same manner as on the lesser scale. The sun and earth, whirling with infinite velocity in space, develop electrical currents which pass to and fro between those bodies in a great cosmical circuit. Thus the sun and earth and all star worlds are actually vast electrical machines or dynamos. The sun and earth thus become harnessed together and work together in harmony through the medium of a great terra-solar circuit. The stars, too, thus work together. All worlds are as one, all force is one, all life is one, all nature a unit.

So far as electrical action is concerned, space and distance become annihilated, and the stars are as if standing side by side. The most genial influences of the sun, as well as the most stupendous electrical powers, are in operation at Neptune, 2,800,000,000 miles distant, as effectually as at Mercury or the earth. The gentle but positive character of the universal electrical force is seen in the fact that a current may be transmitted across the ocean through the medium of a wire simply by employing a percussion cap and a tear for a battery.

Upon the action of the currents of the terra-solar circuit depends all physical phenomena of the earth—its heat, light and dazzle, its gravitative and chemical actions, etc. In the words of Wm. H. Preece, the distinguished electrician of London, "All physical phenomena, every form of force, without a single exception, may be traced to the mere transformation of the electrical energy."

To briefly sum up our study of the nature, the cause and the teachings of the sun's dazzle, we may say that this same universal electrical energy, product of the tremendous motions of the heavenly bodies, the universal electrical energy whose existence was not even suspected prior to the present generation, is working toward the radical revolution in human thought and science and philosophy. Through this great revolution the sun of the past ages, the sun of our fathers, *i. e.*, the raging ocean of gas and fire and flame of present science, is fast giving place to a real sun, made on a grander plan, and whose operations are not after the analogy of the torchlights and heating furnaces of poor human contrivance.

The electrical energy of celestial motions is the universal force, and henceforth must be accepted as both interpreter and interpretation of the manifold phenomena that heretofore have stood as confused and unrelated facts outside of any perfect system of cosmical science.

A curious experiment with an alloy of copper and aluminum has been reported to the Paris Academy of Sciences by M. Le Chatelier. Equal parts of aluminum and copper were, it is said, fused together in a crucible. The resulting ingot was then placed for twenty-four hours in a solution of common salt and chloride, with a view to dissolving out the uncombined aluminum. No apparent change could, at the end of that time, be observed in the ingot. It was accordingly removed from the saline bath, washed and dried. At the end of twelve hours the whole mass was found to be reduced to a state of powder from the spontaneous oxidation of the alloy. A similar ingot, not immersed in the solution of sodium and lead chlorides was unchanged at the end of a month.

The French chemist Berthelot has made alcohol by an entirely new process, which gives a perfectly pure product and consequently less deleterious to the health. He sends a current of hydrogen gas through the flame of an electric arc formed between carbon rods. This produces acetylene, which combines with nascent hydrogen and yields ethylene. The last mentioned hydrocarbon, absorbed in sulphuric acid, makes sulphovinic acid; and mixture and boiling with water finally produces alcohol.

Mechanical Progress.

New York's New Suspension Bridge.

The suspension bridge project for the Hudson at New York assumes the use of no fewer than six tracks. The older New York and Brooklyn structure is in reality two bridges hung side by side and braced together, the promenade being an extra weight on the interior cables. It has a fifteen and five-eighths inches cable on each side; in the estimates for the new work a cable of twenty-one and one-half inches diameter is spoken of. These supporting cables of long bridges are made of steel, and are either chains composed of connected links, or are formed of parallel wires or twisted wire rope. To obtain the widest span possible, the weight of the cable must be a minimum as compared with its carrying capacity. Steel in the form of wire has a minimum strength more than double its maximum strength in the form of bars that would be suitable for the construction of a suspension chain. A wire cable can be stretched about two and one-half times as far as a steel chain before being broken, under like conditions. The cables of the Brooklyn bridge have 5400 wires in them. The cables of the Cincinnati bridge have a diameter of twelve inches, and each contains 5200 No. 9 wires. There is a practical limit to the number of wires that can be united in a cable. The number suggested for the Hudson bridge is 6000 parallel steel wires, No. 3 gauge.

The *Engineering News* noted recently a striking example of the accuracy of American tools and workmanship in the case of the twelve-inch guns going from Watervliet arsenal to the proving grounds at Sandy Hook. Each of these guns is forty feet long and weighs 115,000 pounds, yet the difference in weight between the seven guns is said to be only five pounds. These guns are nickel steel tube army rifles of forty calibers in length, instead of the usual thirty-five calibers. Instead of a jacket a series of hoops are shrunk on the inner tube for nearly the whole length of the gun, and over this is shrunk a single jacket, covering about two-thirds of the length, and then another layer of long hoops. When the intricacy of this assembling process is considered in connection with work done on lathes capable of handling guns forty feet long, the close agreement in weight is almost phenomenal.

The air injected into the pneumatic chambers of the Third avenue bridge across the Harlem river, New York, is heated to so high a degree by the work of compression that, particularly in hot weather, it becomes unsuitable to work in, and has been noted at 104° in the working chamber where the workmen were stripped to the waist. To remedy the trouble Messrs. Arthur McMullin & Co., the contractors, have applied a cooling device that is very simple and satisfactory. The four-inch pressure pipe which delivers from the receiver into the caisson enters a tank, and terminates in a header tapped on a side to receive 16 one-inch pipes, which, with elbows and return bends, form a large compact coil connected at the extremity with another four-inch header, which emerges from the tank and is continued as the regular supply to the caisson. City water is supplied to the tank, and flows through it to the suction of the boiler feed-pumps and feed-water heater. The air supply is thus made cool and comfortable, some heat units are saved for the boiler feed, and the regular water supply is utilized without extra cost.

It is thought that there will soon be important changes in the mode and means of newspaper making. The reporter will send both description and picture by telautograph, and the reporter of the future is going to draw as well as to write. The editor, whether in his office or temporarily residing at a distant point, will telautograph his orders and his ideas, and, by an improvement now being perfected, he will receive telautographic proofs in return. Writers on newspapers will become users of a machine in process of construction by which the present typewriter keyboard will not only set their ideas into print, but will also instantaneously put them into type, eliminating the machine typesetter as the machine itself has eliminated the hand compositor, and as the steam press eliminated the hand press. These are only a few of the changes in the near future of journalism. These and others bound to come will not injure any one, but will divert to other profitable fields labor now occupied immediately between the writer and the press.

The ball nozzle which has excited so much interest throughout the country is intended to work a radical change in the system of fighting fire. Instead of working at a distance with straight streams, firemen, by using the ball nozzle, can enter burning buildings and work at close range, thus not only doing more effective work, but averting to a considerable extent the serious damage to interior property, and in many cases this system will enable firemen to save the lives of inmates of burning buildings.

It has been found by means of magnetic observations that an enormous bed of iron ore underlies the city of Moscow and the surrounding country. But it is apparently at a depth of nearly 35,000 feet, or about six or seven miles, and is is therefore beyond reach. It is of the magnetic variety, which fact accounts for this interesting though tardy discovery.

Hiram S. Maxim recommends the adoption by engineers of a standard of the loudness of sound, comparable to the candle as a unit of light intensity. Thus, he thinks, it could be ascertained whether machinery in a building made more racket than street traffic. He would employ a phonograph in making such tests.

Celluloid, a composition of gun-cotton and camphor, is highly inflammable usually. But a fireproof variety of it has been invented in England. It makes admirable stereotypes, and it gives as good a duplicate as electrotyping and at less cost.

Electrical Progress.

Causes of Atmospheric Electricity.

Although the occasional lightning and, in these latitudes, still rarer aurora borealis are almost the only manifestations of atmospheric electricity with which the majority of people are familiar, it is known to scientists that the air is everywhere, at a certain level above the earth, charged with this mysterious force. The aerial envelope of our globe is a veritable storage battery of enormous dimensions. More than a score of causes have been supposed to be at work supplying the reservoir with electricity, two of the most conspicuous and noted being evaporation and the beating of the waves upon the rocks. Apropos of the recent researches of Lord Kelvin and others into this latter phenomenon, Prince Krapotkine reminds the readers of the *Fortnightly Review* that Plante and Palmieri regarded atmospheric electricity as an agent liable to cause as extensive and violent movements of the air as differences in temperature. It is possible that weather science may be entirely reorganized on this basis some day. Professor J. J. Thompson, of Cambridge University, believes that the process of generation when water splashes against a rock is not altogether mechanical but partly chemical, and that some few particles of the fluid are broken up into their constituent atoms (not molecules merely). His experiments tend to strengthen the view advanced by Helmholtz and others that "electricity and chemical action are two moods of the same energy."

THE Kaweah Irrigation and Power Co. has incorporated; capital stock, all subscribed, $300,000, at Visalia, Cal. Directors—E. C. Ware, Chicago; A. G. Wishon, Tulare; G. Hanna, John A. Pirtle, Los Angeles, and O. C. Ainsworth, Pasadena, to develop and furnish power. It is intended to put up an electric power plant of 3000 H. P. capacity, power generated by water from the Kaweah river, four miles distant, brought in a ditch twenty feet wide and six feet deep, to have a perpendicular fall of 125 feet from the lower end of the ditch to the wheel. There will be a tunnel and several hundred feet of solid rock cut. It is also proposed to irrigate 40,000 acres of arable land. An ice factory, an electric railway and local manufacturing enterprises are embraced in the company's plans. Work on the ditch began this week and will be pushed to completion, as the Kaweah river is now at its lowest stage.

THE electrical engineers and the Baltimore and Ohio Railroad officials are so well satisfied with the tests made by the electrical locomotive that they say trains can now be run through the tunnel regularly by electric power. The tests were continued, and after several loaded freight trains had been hauled through to the satisfaction of those who witnessed the experiment, it was decided to put the new engine in regular service. It is the intention of the Baltimore and Ohio Company to haul all its trains through the tunnel by electric motors.

ELECTRIC FEEDER LINES have been introduced by the Pennsylvania Railroad Company, who hope thus to render branches remunerative which have hitherto been financial failures. The first of these branches to be so worked is the Mount Holly line, which is about seven miles in length. In some preliminary experiments a speed of forty-two miles per hour was obtained with a trolley car on this line, and with two standard cars attached a speed of thirty miles per hour was reached.

IN less than ten years since the introduction of electricity to street railway propulsion, there are now 976 street railway companies in this country, operating 13,588 miles of road. About $750,000,000 of capital is invested in street railroads. Application of electric power to steam roads has been successful, two examples being the branch at Nantasket Beach and the electric locomotive for the Baltimore & Ohio tunnel at Baltimore.

F. R. LEE, Commissioner of Electric Railways of Brooklyn, N. Y., has written to the San Francisco Board of Supervisors, advising the establishment in this city of a commission similar to that at Brooklyn, with jurisdiction over trolley systems, sewer, gas, steam, water and all other service pipes. Here is an excellent chance for Mayor Sutro and Supervisor King to "get together."

SACRAMENTO will have an electric carnival on the night of September 9th to celebrate, on the 45th birthday of the State, the great electric transmission scheme now in successful operation.

Practical Information.

The British Census.

Great Britain is issuing returns of the census taken on the 6th of last April. The population is shown to be: England and Wales, 30,270,817; Ireland, 4,522,982; Scotland, 4,142,471; total, 38,936,270. Thus, about half the population of the United Kingdom is comprised within 58,310 square miles, or 100,000 square miles less than the State of California.

The most remarkable feature of the census is the small increase during the past four years. According to returns made in 1891, the population of England and Wales was 29,002,525, or an increase of only 1,268,292. For Ireland it was 4,704,750, so that there has been a decrease of 181,768. Scotland had 4,025,647, an increase of only 166,824. As many of the cities have increased very largely, the depopulation must be from the rural districts.

The population of the islands is essentially British. Of the 39,000,000 inhabitants, 73.9 per cent were born in England and Wales, 10.60 in Scotland, 13.87 in Ireland, making 98.86 in 100. Of the remaining 0.114, 0.044 were born in the colonies and dependencies, 0.069 in foreign countries, and 0.01 at sea. Of the 30,000,000 inhabitants of England and Wales, there are only 207,000 who are foreigners by nationality and by birth. One out of every ten foreigners in England is a native of "the States." Nearly one-half of the 207,000 foreigners are to be found in London. Still London is not as greatly overrun by them as is popularly supposed; where they are thickest they number only about twenty-three in every 1,000 of the population. Taking the whole of England and Wales, there are not quite seven foreigners in every 1,000.

There are nearly 2,000,000 more people in the State of New York than in Scotland, and almost as many in the State of Ohio. There are more foreign-born people in the United States than the whole population of Scotland and Ireland combined. There are nearly half as many Irish-born people in this country as in Ireland. In 1890 there were nearly as many people in this country foreign-born or born of foreign parentage as the entire population of England.

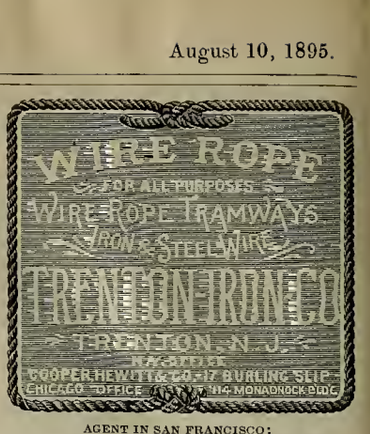
The number of persons to the square mile in England is 519; Ireland, 140; Scotland, 136. In the United States it is about twenty. If the land was parcelled out each Englishman would get one and one-quarter acres; in the United States about thirty-two acres.

Grouping the whole population, without regard to age, we find that out of every 100 people, 48½ are males. Taking the same number of both sexes under 20 years of age, the census shows that 49¾ are males. Taking those over 20 years of age, the greatest difference between the sexes is 52½ women to 47½ men in every 100 of the adult population. That is, there are just 1060 females to 1000 males. Taking the ages 25 and older, there are 1116 females to every 1000 males; for 65 and older there are 1246 females to 1000 males. The proportion in the United States is: Male, 32,067,880; female, 30,554,370.

North Pole by Balloon.

M. Andre has received the sanction of the Swedish Scientific Society to his balloon project in search of the North Pole, and has received a liberal donation to help defray expenses from King Oscar of Sweden. Sufficient funds have been obtained, and the attempt is assured, and M. Andre now desires the approval of the International Geographical Congress.

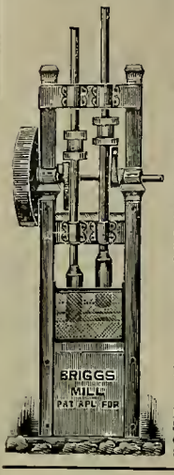
M. Yon of Paris has entered into a contract to make the machine of double silk, of which about 5000 cubic meters will be required, the cost being $12,000. The balloon is to be capable of carrying three persons, with the necessary instruments and ballast. It will be sufficiently gas-tight to hover in the air for thirty days at a height of 250 meters. M. Andre calculates that from 1700 to 1800 cylinders filled with gas under the pressure of 200 atmospheres will be required for the expedition in order to refill the balloon from time to time. He believes he will be able to guide the machine by a system of sails acting as a brake if needed.



The car is to be spacious enough to contain a sledge, a sailing boat, several weapons, with ammunition, and a photographic camera. Early next spring it is proposed to erect a balloon-house, and, after filling the balloon, they will start on the voyage for the pole in July, '96, with a fresh south or nearly south wind. The duration of the voyage must, of course, largely depend on the strength of the wind. It might possibly only last five or six hours, but M. Andre expects that it will take at least over forty. Thirty days, he believes, will suffice for cruising about the central polar basin and taking a complete survey of it.

The return journey is to be made toward the inhabited parts of North America and north Siberia. With a wind of average velocity, M. Andre says the balloon can make 19,500 kilometers in thirty days, whereas the distance from Spitzbergen to the Behring straits via the pole is only 3700.

Dr. H. Wichman of Gotha, one of the most eminent German geographers, in commenting on the subject, says: "The execution of this bold enterprise may, of course, be influenced by many unforeseen contingencies. The project is by no means a fanatical one, but has been maturely and cautiously worked out in the light of science. This is best proved by the fact that Dr. Elkholm, the eminent meteorologist, who was in charge of the Swedish observatory in Spitzbergen in 1882 and 1883, has announced he will take part in the expedition."



THE new law in regard to the maintenance of secrecy by telephone employes as to messages passing over the wires goes into effect on the first of next month. It requires the staff of telephone companies to be as secretive regarding the nature of their business as are the men and women who handle telegraphic messages. A person who either wrongfully obtains or attempts to obtain any knowledge of a telegraphic or telephonic message by connivance with a clerk, operator, messenger or other employe of a telegraph or telephone company, or, being such operator or other employe, willfully divulges to any but the person for whom it was intended the contents or the nature of a telegraphic or telephonic message intrusted to him for transmission or delivery, or of which contents he may have in any way have become possessed, is punishable by a fine of $1000 or six months' imprisonment, or both. The same penalty attaches to neglect or refusal to transmit or deliver messages, except when they are intended for illegal purposes.

MICHIGAN MINING SCHOOL, Houghton, Mich. A high grade technical school. Practical work. Elective System. Summer courses. Gives degrees of S. B., E. M. and Ph.D. Laboratories, Shops, Mill, etc., well equipped. For catalogues write to the Sec'y. M. E. WADSWORTH, Ph.D., Director.

AGENT IN SAN FRANCISCO:
NEWTON M. BELL, 109 California Street.

A Full Assortment of Wire Rope for Mining Purposes carried in San Francisco.

The Briggs
TWO-STAMP MILL,
850-lb. stamps; weight of mill, 6000 lbs.

The most substantial mill ever offered to miners: discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.

Complete as per cut, price **$450.00.** This mill is furnished with 9-inch cast steel shoes and dies, and substantial independent iron guides.

Western Manufacturing Company,
114 and 116 Mission St., San Francisco,

Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

HOIST FOR SALE
CHEAP!

One single-drum water power friction hoist, with five-foot "Pelton" wheel arranged to work under a 660-foot head, and hoist from a depth of 400 feet. Load, 3300 pounds 300 feet per minute.

WILL SELL AT HALF COST; but little used, and works splendidly.

For further particulars apply to

PELTON WATER WHEEL CO.,
121 Main Street..... San Francisco
—OR—
Superintendent James Harry,
New Almaden..... California

WANTED!
To Rent or Buy
A DIAMOND PROSPECTING CORE DRILL
FOR UNDERGROUND WORK.

Complete, in working order. To be run by compressed air and drill from 300 to 1000 feet. Give terms or spot cash price, and all particulars at once. "The Sullivan" preferred.

BOX NO. 23, CRESCENT MILLS, PLUMAS COUNTY, CALIFORNIA.

Gold Quartz Mine
FOR SALE AT A BARGAIN.

Eight Quartz Claims, with 10-stamp mill, complete. Income paying and now in operation. For $90,000, easy payments. Worth $250,000. A "snap" if sold within three weeks; after that time $200,000 will be the price. I want to find a mine purchaser who means business at once.

Four-foot vein ore $20 to $40 per ton.

J. F. CROSETT, 628 Sacramento St.

WANTED!
A COMPETENT MILL MAN,

Who understands Vanner Concentration and plate amalgamation, as assistant in a 50-ton concentrating plant in northern Mexico. Salary $125 U. S. Currency per month. Must be thoroughly sober and well recommended. A married man preferred. Address B. D., care this office.

THE GOLD BUG MINING COMPANY,
Owning rich mining bars and islands on Snake river, Idaho, and controlling valuable patented pump and gold saving machinery,
WANTS COMPETENT MAN,
To superintend working crews on mining boats financially able to invest $2000 if satisfactory after investigation. GOLD BUG MINING CO 94 Sixth St., Portland, Or.

WANTED SITUATION AS BOOKKEEPER and Assayer in mine. A 1 references. Communications confidential.
Address X. Y. Z., This Office.

FRASER & CHALMERS

CHICAGO, ILL., U. S. A. and
43 Threadneedle St., E. C., London, Eng.

Power, Mining, Milling, Smelting, Concentration and Leaching Machinery; Return Tubular and Water Tube Boilers, Corliss Engines, Jones' Mechanical Stokers, Hoisting Engines, Riedler Air and Gas Compressors, Riedler Pumping and Blowing Engines, Cornish Pumps, Roots Blowers, Copper Converters, Pyritic Smelters, Horseshoe Roasting Furnaces, Comet Crushers, Crushing Rolls, Stamp Mills, Shoes, Dies, Perforated Metals, Sectional Machinery, Huntington Mills, Frue Vanners, Bridgman Samplers, Concrete Mixers, Heavy Machinery and Mine Supplies. = = Write for Catalogues

Our facilities for the manufacture of heavy plate steel work, cylinders to withstand heavy pressures, etc., are especially good. We desire to bid on work in any of our lines, and will give information promptly and cheerfully, and quote as low figures as consistent with first-class work. We think we can meet your ideas both in quality and price.

Works at Chicago, Ill., U. S. A., and Erith, Kent, Eng.

Mining Summary.

CALIFORNIA.

Alameda.

A MANGANESE CLAIM.—William Hirst filed a miner's claim to a belt of manganese ore 1500x600 feet in the southern portion of this county, near Livermore—the first miner's claim recorded for many montbs.

Amador.

INCREASED ACTIVITY.—*Record:* Recent developments made in the Aneta and Alma mines at Jackson indicate that those properties are to prove successful and paying ventures. The South Eureka Company are pushing ahead work on a twenty-stamp mill, and when completed the mine is expected to make an excellent showing in the way of production. The Summit mine, which adjoins the South Eureka, will soon be the scene of active operations. Over Amador City way the McIntire mine is to be opened up as speedily as possible, and active work is already inaugurated there. The Median mine is yielding well and the old Keystone continues to hold its own. The resumption of work at the Gover mine is an important event, as it is believed that, with proper development, it will rank with the greatest mines on the mother lode. Alvinza Hayward evidently means business at the Hazard mine, as he is erecting buildings and machinery capable of developing the property on a big scale. The Wildman and Mahoney mines in Sutter Creek are employing a large force of men, and under the management of Superintendent Ross are in a prosperous condition. Thirty stamps are pounding away steadily at the former, and at the Mahoney au additional ten stamps were dropped yesterday.

Mariposa.

GENERAL NOTES.—*Miner:* Tbe Bardarita, which was under lease to Johu Roberts, is now shut down owing to some disagreement as to the royalty to be paid by the lessee, to P. P. Mast, the owner.

The Alice Clark mine is the present scene of much busy work. Its owner is rapidly pushing the work of tapping the ledge, from which point an upraise will be driven to the upper workings. Mr. Clark intends improving the milling facilities as soon as the work of stoping ore commences.

Captain A. H. Ward, of the Pinon Blanco group of mines, is expected back this coming week to arrange for the resumption of work on his properties.

The Merced Gold Mining Co. are busily engaged in erecting the large machinery which is to take the place of the light mechanism now employed in their hoisting plants at the Louisa, Melvina and Potosi mines. They are having an immense quantity of cord wood and timber hauled on the ground. The work of sinking the two shafts and the Potosi winze is being prosecuted with all possible dispatch. No great move has yet been made towards bringing in the ditch from Tuolumne river, from which the electric power is to be secured.

The shaft in the Tyro mine is being pushed to the 700 level as rapidly as three eight-hour shifts can do the work. The south drift on the 500 was advanced twenty feet during the week. The mill still continues idle, though as soon as sinking is over with sufficient stoping ground will be opened up to keep plenty of quartz on hand for steady crushing. During the partial cessation of work tbe machinery is being touched up a little. Superintendent John McLaughlin reports the ore bodies as looking very promising.

Merced.

PLACER MINING.—*Herald:* Mucb placer mining is going on in and about La Grange; to such an extent, in the aggregate, that the 2,000 inches of water carried in the La Grange W. and M. Co.'s ditch is pretty much all in use. Mexicans, Chinese and not a few Americans and Englishmen are engaged in the work and all seem to be making a living. Pockets are known to be found quite often, and there is no doubt that many of these discoveries are not made known. A few days ago a man engaged in mining of this description found a pocket and after taking out about $100 worth of gold went on a tour of celebration. While he was thus engaged, others cleaned up the pocket, it is reported.

Nevada.

Tidings: The West Harmony drift gravel mine continues to pour forth its golden treasures. To-day the regular clean-up was made and the result was a large bar of bullion worth several thousand dollars. It is to be regreted that this company's ground will soon be worked out, as the cessation of operations there means the laying off of about fifty employes.

At the original Harmony mine, further up the ridge, splendid gravel is being taken out, and it is expected that the next clean-up will be one of the largest ever made there.

HAVE STRUCK GOOD QUARTZ.—*Tidings:* A year ago a company of tributers leased the California mine, on the left side of Deer creek near the old Seibert place, for a term of five years. They have run a tunnel 200 feet, striking the old California ledge where it is from eight to sixteen inches wide. The quartz is of splendid quality and a crushing had recently yielded $24 per ton. The indications are that the ledge will increase in width considerably before long, in which event the tributers will have a good thing. Even with a small ledge of quartz like that last crushed they can do pretty well.

WILL PROBABLY BE SOLD.—*Transcript:* The Jeffersonian quartz ledge, near Bowman's Dam, will probably be sold soon to a New York syndicate. A gentleman representing the company will visit the mine Wednesday. Owing to the immense size of the ledge, which runs from 300 to 500 feet in width, the mine has been called the Young Alaska. The quartz carries considerable sulphurets, which assay $129 per ton, while the assay of the ore shows from $6 to $8 per ton in free gold. Gen. A. M. Dobbie, of North Bloomfield, is the present owner of the property.

BOUGHT A THIRD.—*Union:* A third interest in the Blue Lead mine at Relief Hill, belonging to the Cotton estate, has been sold to W. Cameron, J. G. Landshurg and E. Power for $825. Fine gravel was recently struck in the mine and tbe prospects are very encouraging.

NEW HOISTING WORKS.—The Cadmus Mining Company, whose property is on Deer creek, below the Providence, have begun the erection of their hoisting works. The machinery will be of a capacity sufficient to work to a dept of 2000 feet. The shaft at the mine will be vertical, instead of on an incline, as with most mines in the district.

Placer.

MINE SOLD.—*Sentinel:* The Eureka Consolidated Mining Co., of whicb Felix Chappellet is superintendent, purchased this week the Indian Springs mine from J. H. Neff and D. W. Lubeck. The claim consists of about 2000 acres and lies just ahead of the famous Red Point mine. This, with the 3600 acres already owned by the Eureka Co., will give it one of the largest, if not the largest, area of any drift mining company in the State.

Riverside.

GENERAL NOTES.—Among late locations of mining claims in Riverside county are two by J. B. Merris and W. J. Blair. Tbey have named them "Straubenmuller No. 2," and "Oro Mucho." The mines are located in the desert country.

H. D. Converse and J. A. Jordon have located a claim in the Eagle mountain district, Riverside county, about half a mile nortbeast of the Buzzard Springs, the only source of water known on that mountain. The same parties have also located a mill site at the same place and appropriated the water.

The Rosina, Hayseed and Milly mines have been located in the Menifee district by E. M. Woodberry and E. L. Platt and their location notices have been filed witb the County Recorder at Riverside.

Another rich mining strike, says the Perris Valley *Record*, is reported from tbe desert about one hundred miles east of San Bernardino. It is in the Gypsy mine in the Virginia Dale district. Tbe find is described as a five-inch streak of decomposed quartz running through a twenty-four-inch vein. Tbe solid ledge matter is said to have shown $208 to the ton in free gold wbile in some of the higher grade ore the assays are reported as bigh as as $423. Tbey are down sixty feet with a twenty-five-foot drift each way.

Work on the Ophir mine, says the Elsinore *Press*, is progressing finely. Tbere are at present about twenty-five tons of ore ready which will be taken to the Good Hope for milling. What has been already milled runs about $20 to the ton.

San Bernardino.

IT IS STILL RICH.—*Times-Index:* The trial run of the five-stamp mill just set up at the McHaney mine gives more proof of the enduring richness of the mine. Tbe mill was started Friday and in a thirty-hour run it pounded out $3400 in gold. During the run, a little over twelve tons of ore was worked up, which gives the showing of almost $300 to the ton, a value which if it holds out will soon result in running the product of the mine into hundreds of thousands.

From the start the now famous mine has been made to pay expenses, and pay its own way. A two-stamp mill was rented and gold enough taken out to pay for developing the mine, and finally for the new five-stamp mill which has just been started. Now it will be kept pounding away until gold enougb has been taken out to pay for a forty-stamp mill, which is in contemplation, and when that is in operation, if the mine continues to be so rich, one day's run of the ore will net a small fortune.

THE MORONGO KING.—A strike bas been made in the Morongo King mine, and the ore uncovered is being boisted from the 300-foot level. Tbe new strike is a seven-foot ledge; the first tbirty tons which were milled netted almost $4000.

ADDITIONAL STAMPS.—Holland & Tingman are having built a five-stamp mill near the Desert Queen mine. Five stamps are to be added to the Lost Horse mine about forty miles east of Banning.

A ten-stamp mill will shortly be put in the Keystone mine, near Vanderbilt, by Tom Williams.

TAILINGS TO BE WORKED. — *Times-Index:* Arrangements have just been completed by which 100 carloads of tailings which have accumulated at Victor will be brought to this city and worked up. H. S. Sherard, a mining engineer, and Dr. J. T. Colliver are interested in the plan, and work is to begin at once, arrangements for transportation having been completed.

The mines which are tributary to Victor have for some time been hauling down the tailings, when coming for supplies, and the tailings have accumulated until there is now 100 carloads lying at Victor. The plan of the new enterprise is to bring the ore to this city, where the plant of the West Coast Lumber Company has been secured, and they will be treated to processes for extracting the remaining gold. If the work proves to be successful, and the projectors are confident of the outcome, it will become a regular industry, and the tailings from all the mines in the district which draw supplies from Victor will be brought to this city and worked.

The first shipment of 100 cars is in the nature of an experiment, but it may lead to the establishing of a new and very important industry for this city, and may be tho precursor of smelters, whicb bave for years been the dream of local enthusiasts.

The tailings come from the mines in Holcomb valley, Bear valley, the Morongo district, and from mines through all that section of the mountains, but there is the desert to draw from, should it be profitable.

San Diego.

GREEN WINS: WHITE LOSES.—*Union:* An instrument was filed in tbe county recorder's office yesterday by which Zacharias H. Lowman of Santa Monica and Thomas Johnson of Hedges, bond a group of mines in the Cargo Muchacho district, on the desert, to Clarence S. King of Atchison, Kan. The mines are known as the Fair West, Eastern Extension, Homestake, American Girl and Black Quartz, and the option is given for one month with the privilege of six more, and at the end of that time "if the green ore overlaying the white quartz in the American Girl should be developed in paying quantities, that is, $5 or more per ton," then the price to be paid for the group by King is $120,000. If the green quartz should not be so developed, the price of the group is to be $60,000.

Santa Barbara.

ANACOPA ISLAND.—The Santa Barbara *Independent* says that John Roseigh, one of tbe discoverers and owners of the ledge of ore on Anacopa Island in the Santa Barbara channel, has certificates of assays of the ore, showing returns that will average $14 to the ton. Tbe owners of the island will continue their developments and if the mill returns continue to prove satisfactory the necessary machinery to mine the ore will be put up.

Shasta.

THE MURDOFF PROCESS.—*Free Press:* The Eureka Tellurium Gold Mining Company completed the setting of the last piece of machinery of the Murdoff process Wednesday, and on Thursday morning started the entire plant on high-grade ore. J. S. Ludlum, the secretary of tbe company, is quite confident of success, as thorough tests have been made on low-grade ore.

NEW CHLORINATION WORKS. — The new chlorination works that R. G. Hart is putting in on the Texas will have a daily capacity of a ton and a half. The proposed 2000-foot tunnel will be run when a further depth of seventy-five feet is attained.

GENERAL NOTES.—*Searchlight:* E. B. Preston, Field Assistant of the State Mineralogist, is in town on his way to Trinity county. He will return in a few weeks and examine mines and prospects in this section.

Mr. George is about to put up a pump on the Jim Blaine, and after freeing it from water proceed with development.

E. Markwick, superintendent of the Clear Creek Milling, Mining & Power Co., has increased the force to complete the dam in the ereek. When completed the water will be used for power and the bed of the creek will be worked for gold above the present site of the Igo bridge.

Supt. Tozier, of the New Brunswick mine, now being developed near the Tower House, reports work progressing favorably on that property. A tunnel 350 feet in length, designed to tap the ledge 200 feet below the present superficial works, is being run and is already nearly half completed.

Siskiyou.

GENERAL NOTES.—*Journal:* Tbe water supply for hydraulic mining is getting short, owing to the continued hot and dry weather prevailing, hence work has been stopped with the giants, wbich require a great quantity of water and heavy pressure. The miners are now cleaning up along the bedrock with the light supply, so as to finish before the ditches and small streams are completely dry.

Teamsters are busily engaged in hauling the big pumps, boilers and other machinery to McAdams creek from the Yreka R. R. depot, to be used in reopening the old Steamboat claim, noted for its richness whenever possible to get down to bedrock in pumping out tbe water. This machinery is to be used for drainage until a bedrock drain is completed.

The Black Lead mine, at Greenhorn, under the management of J. W. Scheld, bids fair to become a valuable gold-yielding claim, as the gravel at bedrock prospects very rich, and is of good quality, worth $17.40 an ounce. He has a force steadily at work hoisting out and washing gravel, aided by two steam engines, one for hoisting and another for pumping. The drainage pump is one of the old-fashioned Cornish pumps worked by a wbeel at the surface, operating a plunger reaching down to the bottom of the shaft. The water pumped out is utilized to good advantage in the sluices, for washing the gravel, wbicb supply, though not extensive at present, will be abundant to work on a larger scale when winter storms commence again.

The Espey, Hunter & Co. pump at Shasta river still continues to work nicely in throwing the water over the big hill into the flume, and as soon as the flume is soaked up to prevent leakage and the ponderous machinery gets limbered to work smoother, a full supply of water will be afforded to run small hydraulie pipes on the banks to be worked. When everything is in good working order the mammoth pumps are expeeted to raise from 125 to 150 inches of water, in supplying the flume at summit of hill north of Hawkinsville.

The Hunter & Co. ditch at Horse creek, on the lower Klamath, is completed, and water was started through the high flume during the first of the week. Piping is expected to be commenced next Monday, in getting out gold dust.

Trinity.

WORK PROGRESSING.—Twenty men are at work in the two camps on the two-mile tunnel of the La Grange Company. The work is to be prosecuted from both ends, and a shaft is to be sunk in the center so that four sbifts can work at once. This tunnel, when completed, will connect with the ditch to Stewarts Fork, and will save nine miles of ditcb digging.

M. M. Johnson, of this city, owner of the Hoboken Flat property on lower New River, has men at work digging a two-mile ditch from Bell creek, which will have a capacity of 600 inches. In addition, he is making a bedrock cut, which in some places is twenty feet deep in hard granite.

NEVADA.

ON THE COMSTOCK.—The only work done in the Savage mine during the past week was in repairing the main hoisting shaft from the 800 to 850-foot levels. This work was finished and tbe usual mining operations were resumed throughout the mine on the morning of the 5th.

SOUTHEASTERN NEVADA.—In Robinson district, in which Ely is situated, the Chinaman mine is reported developing into bonanza. There is a large body of gold-bearing ore in the mine and the company is now running a tunnel to drain it.

DeLamar is now a lively camp. The mines are producing well and gold bars are shipped every week.

YERINGTON ET AL. — James Yerington, with St. Louis men, is at Silver Star district, to look at the gold mines which were not sold to Senator Wolcott, of Colorado. Mr. Yerington tbinks there will be no doubt about a sale being made this time.

LYON COUNTY.

HAVE STARTED WORK.—Tbe Green Mining Company has started operations in Silver City under the management of D. Crosby.

A CYANIDE PLANT.—The Carson River Dredge Company will soon begin the erection of a cyanide plant to work the concentrates that are taken out of the river by the dredge.

OREGON.

TITLE TO THE VIRTUE MINE.—Judge Eakin bas rendered a decision in the case of Francis Clarno, assignee of the Virtue Mining Company, vs. George W. Grayson, involving tbe title to the Virtue mine, Baker county's heaviest producer. The decision was in favor of Grayson, the court finding that the Portland company forfeited its right of possession by failing to comply witb the contract.

ON THE UMATILLA.—Placer mining is in progress on the Umatilla river above Pendleton. The sand along the shores in that section, both on the Columbia and Umatilla, have been known to contain gold, and Cbinamen for a long time have been mining on a small scale.

STAMP MILLS FOR THE BOHEMIA MINES.—Cottage Grove reports tbat two 10-stamp mills are going into the Bobemia country this fall—one on the Star and one on the Champion mine. The Music mine is taking out $5000 per month with five stamps.

WASHINGTON.

THE MONTE CRISTO.—The Everett smelter is running to the full capacity of its roasters, with one stack now smelting eighty tons daily. The works have three stacks which can be used by increasing the roasting capacity. The Monte Cristo mine, sixty miles from Everett, in the Cascade mountains, is sending 1000 tons of concentrates per montb. The ore is iron, carrying gold, and is low grade. On the surface it was considered a lead proposition, but with development the ore has changed. None of the other properties in tbat district are being worked.

THE TACOMA SMELTER.—The following is furnished by the Tacoma Chamber of Commerce, being a statement of operations of the Tacoma Smelting and Refining Co. for the month of July, 1895: Number of men employed 63; pay roll $4510.31, woodchoppers and teams $996, total $5506.31. Product—2000 bars bullion, weighing 204,704 lbs., containing: 1175.45 ozs. gold ($20.67) $24,296.55, 32,056.55 ozs. silver (.66¼) $21,317.60, 202,423 lbs. lead (.03¼) $6578.75, total $52,192.90.

BRITISH COLUMBIA.

NEW MINING DISTRICT.—A new mining district on the Salmon river is attracting the attention and investigation of prospectors and capitalists. Tbe district can be reached either from Waneta, at the mouth of the Pend d'Oreille, or from Salmon siding. Botb places are on the Spokane & Northern.

SEND THE NEWS TO LAMOUREUX.—A Victoria, B. C., dispatch says: The Supreme Court, five Justices sitting, decided the case of W. H. Bainbridge vs. the Esquimalt and Nanaimo Railway, involving the ownership of precious metals in railway lands on Vancouver Island, in favor of the plaintiff. All the Justices agreed that the land grant did not carry with it precious metals, and laid down the principle that if it is desired to do so in future grants they must be specifically mentioned in the grant. The Dunsmuirs will appeal to the Privy Council. The suit involved the ownership of all the gold, silver and quicksilver claims in the railway belt.

ALASKA.

JUNEAU MINING CO.—Hayward and Lane, of the Juneau Mining Company, who have lately erected a 30-stamp mill, have ore which runs from $1 to $14 per ton. The cost of mining and milling is calculated at from $1.50 to $2 per ton.

IDAHO.

THE COMET MINE.—The Comet gold mine, on Deer creek, near Soldier, on Camas prairie, has been bonded to a party of Salt Lake men, who have agreed to ereet a mill thereon to test the value of the ore and to do other development work.

THE LAST CHANCE.—Wallace *Miner:* Charles Sweeney is baek at his old position as superintendent of the Last Chance mine. They have thirty-five men at work, which is all they can use at present, and have not the slightest difficulty it getting all the miners they need. They are already breaking down ore. They are running the mill on one shift

for the present, but will commence next week to run it on two shifts. They are now working from the lower tunnel, but will also commence in the upper workings shortly.

WILL PUT IN A FIVE STAMP MILL.—O. H. Thompson, at the old Pierce City district in northern Idaho, has bonded the Best Chance group of mining claims for $40,000, and will immediately put in a five-stamp mill, estimated to cost $8000. The pay streak is from one to four feet, and continues the full length of six claims. There is a 110-foot tunnel to the ledge, showing it up at thirty feet of depth.

MONTANA.

BELL CONSOLIDATED MINING CO.—This property was secured some time ago by Col. R. A. Hawkins, of Helena, and organized into a stock company with a cash capital of $300,000. The property is six miles from Townsend and consists of three locations all on the same vein. Work is now progressing on the Bell mine. They have a shaft down 80 feet, in the bottom of which, it is claimed, there is six feet of concentrating ore, running from 60 to 180 ounces in silver and 60 per cent lead, besides a small streak of gold. It is the intention, within the next month, to equip the property with a steam hoist, and put up such other machinery and buildings as may be necessary to properly work and develop the property extensively. The Bell vein crops strongly on the surface, and can be easily traced throughout the entire length of the three claims.

REPORTED SALE.—A New York paper of the 7th says it is reported there that W. Hamilton Smith "concluded negotiations for the purchase of a controlling interest in the Anaconda mine." The report is very improbable.

WYOMING.

A GOLD STRIKE.—A strike was made by the Pennsylvania Mining Company at Seminole last Saturday, where in a new shaft an eighteen-inch vein of free-milling gold ore was struck.

FOUR-MILE PLACER GOLD.—*Laramie Republican*: Judge Scott and T. B. Hicks, who returned from the Lewiston mines this morning, met Mr. J. C. Davis at Rawlins, who exhibited to them a bottle of placer gold valued at $380, which was fine in size and quality, says the *Sun-Ledger*. It came from the gold deposits now being operated by the Rock Springs Mining Company at Four-Mile, in which Mr. Davis is a large stockholder, and was obtained by working over the concentrates of black sand and gold.

The company has already taken out about $15,000, and it is estimated that the proceeds from the company's property this season will be $40,000. A large number of companies are operating in the Four-Mile district, building ditches and getting ready to work their claims as soon as possible.

SOUTH DAKOTA.

THE GOLDEN REWARD.—*Pioneer*: The Golden Reward Company has ordered another set of rolls and another roaster with guaranteed capacity of fifty tons per day. The roaster will have a continuous discharge like the White Howell, but is a different model. The new rolls will increase the crushing capacity so that the cyanide plant can be kept in operation and with the new roaster the chlorination plant can be run full capacity.

FOR THE KILDONAN MILL.—The first carload of machinery arrived for the Kildonan mill yesterday. The car was labled, "From Gates Iron Works, Chicago." "For the Kildonan Mill, Deadwood, S. D." It had a No. 1 and No. 3 Gates Crusher, an air compressor, large acid tank and considerable smaller machinery. The balance of the machinery will arrive as fast as it can be unloaded and taken care of.

COLORADO.

BOUGHT SEVENTEEN MINES.—The Portland Mining Company of Colorado Springs has just purchased seventeen mines affecting and conflicting with their claims, as follows: The Black Diamond, D's Own, Tidal Wave, Lowell, Milton, Terrible, Fairplay, Success, Roserie, Casco, Lest Anna, Cyclone, fractions of Blue Stocking, Little Harry, Four Queens, and the Bobtails. The price paid was $1,025,000. The purchase forestalls costly litigation. W. S. Stratton, James F. Burns, James Doyle, John Harmon, J. R. McKinney, F. G. Peck and Walter F. Croshy own the stock principally, which is capitalized at $3,000,000. The deal is by far the largest in the history of the camp.

NEW MEXICO.

THE DE LAMAR PROPERTY.—The De Lamar Mining Company, which purchased all the mines represented in the De Lamar claims near Silver City, in 1890, and formed an organization with a capital of $2,000,000, has the property now paying 20 per cent a year on this investment. The ore runs 60 per ceat gold and 40 per cent silver. The company is doing a vast amount of development work, and much of their great possessions have heen unprospected up to the present time.

ARIZONA.

TO LOCATE PLACER CLAIMS.—*Herald*: A party of mining men have left Phœnix to locate placer claims in the hed of the Agua Fria river below the storage reservoir of the Agua Fria Water and Land Company. The gravel of that river ahounds in placer gold; and as soon as the great reservoir frees the gravel from the water so that it can he worked, exceedingly good wages will he made by the miners who have located claims.

MADE A PROMISE.—Messrs. Murphy and Ryan have promised the miners in Lone Star district to provide them with a smelter and reduction works at Safford if they will agree to furnish thirty tons of ore per day, hearing not less than ten per ce it copper.

BONDED FOR HALF A MILLION.—The Crowned King mine, Bradshaw district, forty miles from Prescott, is reported bonded for $500,000 by the owners, Messrs. Place, Sheckles and Harrington, they receiving a cash surety of $10,000 from the purchasers of the bonds, the H. B. Chamberlain Company of Denver. It is stated to be their intentiou to put on improved machinery and work a large force of men.

GENERAL NOTES.—Fifty thousand pounds of machinery are now on the ground at the Bull Dog mine at Goldfields, besides a large amount of lumber. Work on the twenty-stamp mill has commenced.

Alex McLean, of Morenci, will be superintendent for the recent purchasers of the Old Dominion property at Globe.

O. B. Amsden, superintendent of the Gold Bug Mining Company, was in Kingman recently, preparing to ship a large quantity of mill machinery to the Colorado river, west of the Gold Bug. It is expected that the mill will be completed within sixty days.

Mr. McLeish, of Wickenberg, is about to erect a cyanide plant at Smith's mills, on the Hassayampa, to treat the Vulture tailings. He has about 20,000 tons of tailings stored for that purpose.

MEXICO.

POPOCATEPETL SULPHUR.—*Two Republics*: Sixty-eight men in all are now employed in the work of extracting crude sulphur from the crater of Popocatepetl. This includes those engaged in bringing down the sulphur to Amecamera, those furnishing the miners with provisions and supplies, and those in charge of the Tlamacas ranch, or half-way house. The miners are all Indians and all pertain to one family or tribe, the only persons that have the endurance necessary to the task. Each of them receives $15 bonus for his family before he enters the crater and is paid $3 per diem for his work, and binds himself to remain twenty-five days. The product per man is about 125 pounds of sulphur daily, and the article is 97 per cent pure.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1906 Stockton St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 8, 1895.

The metal market still holds up, with strong prices. Copper, especially, shows appreciation. Advices from the Michigan copper mines say that mining men there generally believe that twelve cents a pound will be the price within three months. Enthusiasts are predicting still higher prices, hut twelve cents a pound is plenty of money for a pound of copper. There are enough mines in the country to supply all the metal that is required for that price, and, while paying good wages to their men, return ample profits to stockholders. A higher price will mean a feverish market, greater opportunities for manipulation and the opening of a lot of semi-worthless properties which will get to producing about the time that the hottom drops out, and will score another hig loss to their stockholders, while at the hetter mines wages will suffer, profits will drop and general demoralization will follow.

There are several mines producing copper just as cheaply as the Calumet and Hecla, though not in such amounts, and with their product selling at 12 cents there is not an active mine on Lake Superior which cannot pay good profits to its shareholders. That the Quincy earned $592,000 last year with copper helow 10 cents shows what some of the larger mines can earn on 11 and 12 cent copper. It is said that there is a pool hehind the Boston & Montana pledged to sell no stock short of $100 a share.

Mining Share Market.

SAN FRANCISCO, August 8, 1895.

The Hale & Norcross decision was the feature of the week. The singular part of it is that though it enhanced the value of the stock, the first result was a drop in its price. One would naturally suppose the stock would have soared to $2.50 or even $3 on the strength of Judge Beatty's decision, hut it fell off instead, going on Monday as low as $1.30, although the decision was virtually affording a $1.50 dividend. The salient points in the long-expected decision are published on pages 86, 87 and 90 of this issue. The decision, it is thought, will tend to improve the general tone of the mining share market, and will tend to dispel delusions that have found lodgment in many minds. While in some respects the rulings are a little contradictory, yet the manifest intent is to he fair; and now if there he not too much of a difference between the judgment and the satisfaction of the amount adjudged, it will he of material henefit to the long-patient stockholders.

But the hest results of last Saturday's decision is that it serves notice "to whom it may concern" that such practices as that complained of in the Hale & Norcross suit cannot continue or he repeated with impunity. It will do considerable to restore confidence and put some life into the market, and the hest friends of the mining share market rejoice at the result.

The Calumet and Hecla (Michigan) Copper Mining Co. will pay a $500,000 dividend on the 19th, the higgest regular company dividend of any listed mine in the United States.

The Church Mining Co. paid a dividend of five cents per share on the 8th.

The $8 per share assessment on the Norman mine, Pinal county, Arizona, was delinquent on the 6th. The Potosi, Nevada, $28,000 assessment will he delinquent on the 14th; the Belcher, Nev., assessment of $26,000 on the 20th; the Ophir, of $25,200, on the 13th; the Mono, Cal., of $5000, on the 19th.

The Hite Gold Mining Co., of Mariposa Co., has levied an assessment of eight cents per share.

The agreement hetween the Ophir, Mexican, Andes and West Consolidated Virginia and California mining companies, to explore the Comstock west country from the most westerly workings on the 1100 level of the Con. Virginia shaft, previously described in detail, is finally in determinate shape. For sixty days the Ophir and Mexican companies shall expend $1000 per month, the Andes $500 and the West Consolidated Virginia and California as much as all the others expend, upon the work of drilling westward from the end of the west crosscut, which the West Consolidated have heen running from the north lateral drift on the 1100 level of the Con. Virginia. When work stopped the face of the drift was 1535 feet west of a north and south line drawn through the Con. Virginia shaft. A pipe for compressed air will he laid from the Ophir shaft to the Con. Virginia shaft and thence downward and to the end of the west drift. The drilling operations are to he conducted by Superintendent H. W. Tangermann of the West Con. Virginia and California; the superintendents of the Ophir, Mexican and Andes mines are at all times to have access to the drift and allowed to take samples of the drill pulp. Should any ore discoveries be made each company will have the privilege of using the west drift and the Con. Virginia shaft as outlets in developing its own ground.

The Rawson Ditch Company of Inyo county has levied an assessment of 3 cents per share, delinquent August 24th.

The following is the usual monthly statement of moneys on hand:

BONIE MINES.		Crown Point	$12,158 79
Bodie	$12,440 86	E. Sierra Nev.	83 37

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
ALFRED K. DURBROW, Secretary.
Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

KENTUCK CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of August, 1895, an assessment (No. 11) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of September, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the first day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
AUG WATERMAN, Secretary.
Office—Room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 24th day of May, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
John E. Todd	5	2,500	$ 50 00
John E. Todd	6	2,500	50 00

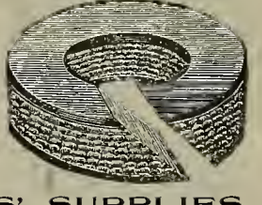
E. C. Godfrey, Trustee	85	2,500	50 00
E. C. Godfrey, Trustee	86	4,000	80 00
Louise V. Rugg	36	10,000	200 00
A. U. Rugg	33	16,667	333 34

And in accordance with law, and an order from the Board of Directors, made on the 24th day of May, 1895, so many shares of each parcel of such Stock as may be necessary will be sold at public auction at the office of the Company, Room 38, Crocker Building, corner Montgomery and Market streets, San Francisco, California, on Monday, the 22nd day of July, 1895, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.
Office—38 Crocker Building, San Francisco, California.

POSTPONEMENT.



By a resolution of the Board of Directors of the Gold Bar Consolidated Mining Company the day of sale of the above delinquent stock has been postponed to WEDNESDAY, August the 21st, 1895, at the same place and at the hour of 2 P. M.

E. C. GODFREY, Secretary.
Office—Room 38 Crocker Building, San Francisco, California.

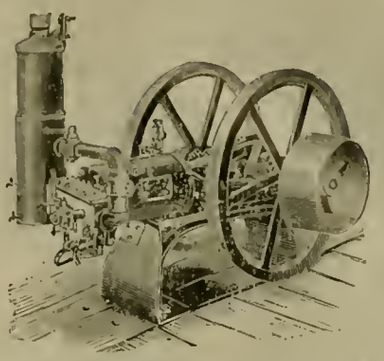
American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SELF MEASURING LIQUID TANK.—Christopher M. Bridges of Seattle, Wash., assignor of one-half to John S. Fanning of S. F. No. 543,169. Dated July 23, 1895. This invention relates to the class of self-measuring tanks adapted for the disbursement of various liquids, but especially for the measuring of oil. The device consists of a main supply vessel, a main measuring vessel of known capacity in the lower portion of the shell of the supply vessel, other vessels of known and different capacities contained within the main measuring vessel, a pipe leading from the main supply and connected with a pipe leading from the main measuring vessel; other pipes leading from the main supply vessel and connected with pipes leading from the interior measuring vessel; cocks at the junction of each pair of pipes and a single discharge pipe into which the contents of the one or all of the measuring vessels may be discharged singly or collectively.

CAN FILLER FOR ICE MACHINES.—Richard F. Schroeder, Sacramento, Cal. No. 543,159. Dated July 23, 1895. This invention relates to a device for filling cans, which is especially adapted for use in conjunction with the cans in which water is frozen in ice machines. It consists of a can having a vertical central supply pipe; a spider in the bottom of the can into which a supply pipe is fixed; a valve chamber, into which the pipe discharges; a downwardly closing valve, with a stem resting upon the bottom of the can, whereby the valve is kept open while the spider is at the bottom; a second spider fixed to the supply pipe near the top of the can; a float fitting the interior of the can and movable loosely therein about the central pipe between the two spiders, said float being raised as the can is filled with water, and acting to raise the upper spider and connected pipe and with it the lower spider, when the can is filled, whereby the supply valve is closed and the surface of the water is kept out of contact with the air.



EXPLOSIVE ENGINE.—Michael L. Mery, Chico, Cal. No. 543,157. Dated July 23, 1895. This invention relates to explosive engines of the double-acting class, and its object is to provide an engine of this kind, simple in its construction of parts, efficient and accurate in its explosions and capable of easy and perfect adjustment. The details of improvement in the engine are numerous and relate principally to the sparking apparatus, the means for regulating and adjusting it, the means for operating it, the means for insulating the stems of the electrodes, the valves and the means for operating them, and the means for drawing in fresh air into the engine when the exhaust valves are opened.

TELEPHONE EXCHANGE.—W. Y. Shibata, San Francisco, Cal. No. 543,160. Dated July 23, 1895. This invention relates to an automatic telephone exchange system, in which each subscriber is enabled to connect himself at pleasure with any other subscriber, and to disconnect himself therefrom. It consists of parallel non-conducting bars having metallic conducting plates extending across them, and connected in alternate groups with the line wires; tracks having their upper surfaces toothed, extending across above the bars and plates; cars having gear wheels adapted to engage the teeth of said tracks; electro magnets; means for transmitting a current through the electro magnets; swinging permanent magnets movable between the cores of the electro magnets and caused to oscillate about their fulcrum points by the energizing and de-energizing of the electro magnets; pawls hinged to the lower end of the swinging permanent magnet, adapted to engage the teeth of the track and non-conducting cords connecting with the pawls and with arms upon the swinging magnet, said cords passing through guides, whereby the swinging of the magnet to one side will disengage one of the pawls and engage the other, so that the car will be moved constantly in one direction, and the reversal of the current will reverse the position of the pawls so as to move the car in the opposite direction. Non-conducting shields are arranged with relation to the tracks, so that the contact will not be formed except for the particular car that is to be operated, and exchange boxes are located at the station of each subscriber, with indicators movable over dials upon the boxes at the subscribers' stations, and switches and contacts whereby the cars at the central station are moved upon their corresponding tracks until communication with any desired subscriber is obtained.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 11c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 10 gallons @ 8c	80
Crude Petroleum (36 deg.), paraffin base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mecbanical construction.

We bave been granted two United States patents for improved devices in concentrating belts, the first and most important of whicb is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam tbat may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smootb surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 7. SAN FRANCISCO, SATURDAY, AUGUST 17, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Some Desert Mining Country.

In Inyo county, on the southeastern border of this State, are the highest and lowest lands in the United States, and within fifty miles of each other—Mt. Whitney, 15,000 feet above sea level, and Death Valley, 480 feet below sea level. Whitney is the culmination of the southern Sierras; Death Valley, between the Panamint and Amaragosa ranges, the arid bed of an ancient lake.

The country is more like Nevada than California in its climate, physical aspect and mineral deposits. To the prospector in northern or central California, or the States of Oregon, Washington, Idaho and Montana, where grass, timber and water are almost always accessible, the desert region of Mono and Inyo counties (of which the two points named are the most prominent) have nothing but repellant features. The absence of vegetation, the intense heat, the irritating alkali and the somber silence make a combination the reverse of attractive to the prospector or miner.

Yet that whole region has been prospected, many a poor fellow leaving his bones to bleach there and considerable mineral wealth extracted. The country is rich in gold, silver, lead, antimony, copper, iron, soda, borax and building stone. A view is given of Cerro Gordo, not an ideal place of residence, yet the writer spent some of the happiest years of his life in just such a place. Around Cerro Gordo are rich deposits of silver and lead; of course, at present prices, nothing is done there, for, unlike Montana and parts of Colorado where even now silver and lead can be produced as by-products, transportation is a tedious and costly affair, it being necessary to carry nearly everything used on mules and burros. An illustration appears herewith of a pack train in its quieter moments. The patient beasts are better than horses; and though at times irascible and provocative of profanity, they are the best craft by and on which to navigate the desert mining country.

Volcanic tufa and hornblende andesite prevail in the northern and western part of Inyo county; in the eastern and southern part is coarse granite and limestone. The Panamint range is a prominent feature for sixty miles in this desolate country; it is mostly made up of limestone, quartzite, slate and mica schist. Accompanying is a view of Death Valley from one of the Panamint peaks. Though the Panamint range is characterized chiefly by silver deposits, considerable gold has been found in the southern part. Gold has also been found in paying quantities at the western base of the Inyo range and southeast of Independence. Along the western slope of the White mountains, northeast of Bishop Creek, is a gold belt, and between Benton and Owens river, as well as at Mammoth, in the southwestern part of Mono county, gold ore, not free milling and of low grade, has been mined in considerable quantities. "Remote, unfriended, melancholy, slow," the part of California's mining area here briefly referred to is seldom noticed and little understood. Its inaccessibility has retarded its development. Rich in precious metals, it will yet assume prominence; increased facility of transportation, improved processes, the utilization of electrical force, will aid in bringing this neglected section to the front. It is a country where, so far, every dollar in gold and silver produced has cost three, if all things be considered; but all countries have to have their pioneers, and in this desert land where none but the bravest ventured and none but the strongest survived have been scenes of trial and endurance equal in point of interest and merit to those of any mining region on the earth.

PACK TRAIN IN PANAMINT VALLEY.

In the present gold renaissance Nevada is the slowest of States. The commonwealth that so long astonished itself and the rest of the world with silver mines that paid a clear profit of hundreds of millions of dollars, has appeared to cling to the memories of the past rather than realize the possibilities of the future. There are signs of an awakening. Nevada prospectors are beginning to feel that the old Silver State is not destitute of gold; that the mineral wealth of that arid region is not confined to silver alone, and that, if sought for, paying gold properties can be found. There are plenty of places in Nevada that are richer in gold than in silver. The old days of the chlorider will never return. A line drawn from St. George, Utah, to Lakeview, Oregon, would bisect the State, and the territory lying in Nevada to the westward of that line will some day be found to be as rich in gold as, barring the Comstock, it was ever found to be in silver.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Pack Train in Panamint Valley; Death Valley From the Panamint Range; Cerro Gordo, Inyo County, 101.

EDITORIALS.—Some Desert Mining Country; Nevada as a Gold Producer, 101. Appeal Forwarded to Secretary of the Interior Smith; Colusa County and the Anti-Debris Association; The Miners' Association; Renewed Attention to California's Gold Properties by the City Press, 102. The Mechanics' Institute, 103.

SCIENTIFIC PROGRESS.—Records an Earthquake; Necessity for a Patent Court; Tests of Timber; Protecting Iron and Steel Against Rust; Pure Molybdenum; Water by Boring Into Granite; Cellulose; Smoke From Volcanoes, 108.

MECHANICAL PROGRESS.—Electric vs. Hydraulic Elevators; A New Telegraphic System; The Two New Battle Ships; Device for Stopping Engines; The New Navy Rifle; Wire Nails a Failure as Shingle Nails, 108.

ELECTRICAL PROGRESS.—A New Electric Railway System; Edison's Minor Inventions; Welding Copper to Iron or Steel; Electric Road Between Chicago and St. Louis; Accidents From Trolley Cars; Electrical Plant for the Manufacture of Phosphorus; Young Men in Electrical Work; Caledoli's Type-Setting Machine; The Mutual Electric Light Co.; Headlight for S. P. Co.'s Engines.

PRACTICAL INFORMATION.—Russia's Mineral Development; Seasoned Lumber; Shelled Eggs; Heliographic Signals; Corrosion in Upright Boilers; Medals and Diplomas Awarded at the World's Columbian Exposition; High Speed Engines; Submerged Continent, 109.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 106-107.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 114.

MISCELLANEOUS.—A Letter From Mr. Ford; Concentrates, 103. Mineral-Bearing Veins; The Wet and Dry Seasons in California, 104. Mining on the Colorado; Cyanide or Other Chemical Proportions for Laboratory and Mill Workings, 105. Coast Industrial Notes, 107. Notices of Recent Patents, 115.

LAST WEDNESDAY A. H. Ricketts, chairman of the Committee on the Protection to Mineral Lands of the State Miners' Association, received a formal notification from E. F. Best, acting commissioner of the General Land Office, that the appeal transmitted July 29th from the dismissal of previous protests had been forwarded to Sec'y of the Interior Smith. The protests were against the granting of a patent to the S. P. Co. for 100,091 acres land in the Visalia, San Francisco, Marysville and Los Angeles districts and had been dismissed by Mr. Lamoureux. This was appealed from. These appeals now go to the Secretary of the Interior, so that this matter has at last got out of the office where subordinate subserviency to corporate suggestion is so manifest and goes to a cabinet officer to be adjudicated. It is a decided victory for the miners and a substantial answer to those who ask "What has been done?" A great deal has been done; a great deal remains to do. It is a long step when this whole matter is at last before the Secretary of the Interior and the President of the United States, who personally assured the miners' representative that he would give the matter his individual attention.

COLUSA COUNTY has discontinued its monthly allowance to the Anti-Debris Association. The Board of Supervisors say it is no longer necessary. There is certainly no need for Colusa county or any other county to be burdened with the expense of such an organization, which is neither useful nor ornamental and whose existence is rendered unnecessary by the prompt, impartial and incessant activity and jurisdiction of the U. S. Debris Commission. It is simply a question between the tax-payers and tax-eaters of the valley counties. Whenever the former realize that whatever appearance of necessity for the perpetuation of such an association may have once existed there is no present nor prospective need of it, and that they are simply furnishing employment to two or three local lawyers and informers whose business it is to stir up strife and induce hostility, they will decline to make it of continuous profit. The U. S. Debris Commission has its trusty agents traveling through the whole mining region. Wherever in ignorance or defiance of federal law there is the slightest appearance of its possible infringement the hydraulic miner is summarily dealt with far more promptly and effectively than any anti-debris association could. Of course, if the good people of Colusa, Sacramento, Sutter and Yuba see fit to continue to pay $10,000 a year through their hoards of supervisors to keep a few tax-eaters in a job, that is their business and none of ours. It is likely, however, that in these times of scarce dollars among those who work so hard for the few they get, the tax-payers will refuse to longer hear such unnecessary burden.

The Miners' Association.

Several sensational statements in last Sunday's San Francisco newspapers regarding alleged "rows," "angry debates," "battles," etc., at the meeting of the executive committee of the State Miners' Association on the 9th inst., being given credence and further publicity throughout the State, it is in order to give an unbiased statement of exactly what was done. There were no "rows," nor "battles" nor "angry debates." The writer was present throughout, and though it was an executive session, so much publicity has been given the matter that the usual requirements of not publishing the proceedings should in this case be ignored, in the interests of the Association, which are the only interests that the MINING AND SCIENTIFIC PRESS recognizes.

The first business before the meeting was regarding the claim of Mr. Moran for maps furnished the Association, there being a disputed bill which was settled by the claimant accepting the proffer of the committee and giving a receipt in full. Upon request of Mr. Moutague, Secretary Ralston gave a detailed report of receipts and expenditures since the date of the last convention, in Novemher, '94, it appearing that he had received no salary for the last nine months. Mr. Ralston said that he would donate that amouut—$450—to the Association. (It may be said here that that is the only salaried office connected with the Association, aud this fact, together with Mr. Ralston's characteristic generosity in the matter, should certainly put a stop to unkind comments regarding "expense" and "extravagance" in sundry interior journals.)

The question of holding the next couvention then came up; Mr. Cross spoke earnestly in favor thereof, offering a resolutiou regardiug it and warmly opposing any suggestion that might arise regarding possible or probable relaxation of effort or disbanding of the Association. Discussion of the resolution branched off to a review of what had been done, and, incidentally, to the work of the mineral land committee. Mr. Ford spoke of the work of that committee with praise, intimating that it was his helief that other important duties of the Association should not be obscured or ignored, and the discussion being more informal than parliamentary, that is, not bound by strict rules of dehate, the former suggestion of a "conference with the railroad company," that is, an acceptance of a proffer of arbitration uuderstood to have come from representatives of the S. P. and C. P. companies, outside of the Association, was hrought up. Mr. Thomas moved that a committee be appointed to so coufer. President Neff appointed Messrs. Thomas, Ricketts and Wright, the two latter being prominent members of the mineral land committee. Before the appointment of the committee and just after the passage of the resolutiou authorizing the chair to so appoint, Mr. Wright made some remarks suggestive of a belief that the hest interests of the Association required great care in the naming of that committee, that any one who assumed to be susceptible to railroad influence should be kept off that committee; he referred to the course pursued by Mr. Ricketts, chairman of the mineral land committee, enlogizing its manner and result and expressing his belief that no good could come from the proposed conference, as it had been asserted that the commissioners would be "captured" hy the railroad company. He disclaimed any intention to reflect upon any one present or in any way connected with the Association, hut expressed the belief that the motion made by Mr. Thomas was prompted by the railroad company, and that from a conversation reconnted to him hy another member of the mineral land committee he had reason to helieve that Mr. Cross would he satisfactory to the S. P. and C. P. companies as an intermediary. This brought Mr. Cross to his feet, who disclaimed the imputation, reviewed what had been done and his part therein, being followed by Mr. Ford, who also stated that throughout his only aim and desire was to help the Association in the work it had started to do.

When Chairman Neff announced the committee, Messrs. Wright and Ricketts in turn declined to serve, it appearing that the creation of a new committee supplauted without supplementing the lahors of the former one. Mr. Thomas said he would serve, and made a speech stating that in Nevada county the miners thought too much attention was heing paid the matter of mineral lands and too little to other things. Mr. Ricketts, who, except when uttering the single sentence, "I respectfully decline to serve on the committee," had kept silence during the evening, now arose and said: "I respectfully teuder my resignation as chairman of the committee on the protection of mineral lands and as a member of that committee." Upon this Mr. Montague said it seemed that possible injustice or indifference to the mineral land committee had been displayed in taking the matter out of their hands, so far as the proposed confereuce with the railroad people was concerned, and moved a reconsideration. Mr. Thomas rose to a point of order, hut the chair overruled him, good-humoredly calling attention to the fact that if strict parliamentary rules were observed the whole discussion was not in order pending action on Mr. Cross's resolution regardiug the coming convention, which, according to Cushing, had precedence. Mr. Montague's motion prevailed, and a further motion by him that the matter of conference be left with the former mineral land committee as originally constituted, with power to act, also carried. Mr. Ford then resigned from the chairmanship of the legislative committee and from the Association. Subsequently his resignatiou, as also that of Mr. Ricketts, was withdrawn, and Mr. Cross's resolution that the usual convention be held was carried.

In another column Mr. Ford shows that he is heart and soul with the Association. The same may be said of every member present and of every one who is on the exccutive committee or actively connected with the Association. While there are and have been, and doubtless will he, difficulties and discouragements and differences of opinion, what organization composed of earnest men is free from such things? It is unwise and unfair to assume that anything but the best of feeling exists; it is unjust and untrue to cite the Association as questionahle of existence and filled with distrust and dissension; and, contrary to the facts, to quote sensational statements made with no other motive than simply a desire to be interesting. Were the Miners' Association a sleepy symposium that weekly met and dozed comfortably over abstract subjects, a possible three-line paragraph would be accorded its dusty annals. The fact that it is composed of intelligent, active minded men and is called upon to discuss questions vital to the industries of the State brings out in debate the vim and vigor that characterize vigorous minds. But earuestness must not be mistaken for malice nor force of iutent for disposition to oppose or destroy; and published reports of the meetings of the committees, as of other committees in other public duties, do not always convey correct impressions of the action, intent or results. The Miners' Association is unitedly and unselfishly working for the rehahilitation of the mining industry of this State, for the proper adjustment of the ownership and control of the mineral land withiu the limits of the commonwealth, and deserves and invokes the aid—not in silent assent hut in active effort—of every citizen interested in our progress.

THE renewed attention given California gold properties hy the daily press of this city indicates the renewed interest in the mining industry of the State. Columns are now daily published and the result must be of benefit. California has never adopted the "hoom" method of advertising its great mining resources, and strikes and sales are daily made which, if taking place elsewhere, would be widely heralded. To direct attention to our mineral wealth and truthfully portray our great advantages should be the province and the purpose of every newspaper man in the State, and the MINING AND SCIENTIFIC PRESS gladly notes the powerful aid in this regard so recently enlisted.

The Mechanics' Institute.

The 28th Industrial Exposition of the Mechanics' Institute of this city began last Tuesday under very favorable auspices. The opening exercises were held in the Columbia theater in the afternoon. Mr. Andrew S. Hallidie, president of the Institute, delivered the address, in the course of which he said that the purpose of this exhibition has been principally educational. In its preparation the management has endeavored to provide space for the representation of all the local industries, but many may have been unable to obtain space from the late hour of their application and from the lack of available room. As there has been an interruption in the regular industrial expositions of the Mechanics' Institute since the fall of 1891, a reorganization of the administration became necessary and many new features have been ingrafted, which will be improved in the future, the intention being to hold these expositions annually hereafter, and during this interregnum this State and city have gone through a period of remarkable depression and lethargy. This depression and this lethargy are passing away.

San Francisco, during the interval between the census of 1880 and 1890, has fairly well held its industrial rank among the ten or twelve leading cities of this country. It has advanced in rank one point (from ninth to eighth) in population and has lost one point (from eighth to ninth) in the number of shops and factories. On the other hand, it has increased the amount of money invested, and stands ninth in the list in 1890 and tenth in 1880, and there has been no change in its rank in that decade in the number of hands employed, the amount paid out for wages and the value of the goods produced, which have been respectively eleventh, tenth and ninth. The value of the raw material has been higher, as in this particular the city has advanced from the ninth to the eighth in rank.

Mr. Hallidie's address was interesting and instructive throughout and received much deserved applause.

Congressman Maguire delivered an oration in which the effect of machinery upon labor was discussed and the single tax extolled. He concluded by saying that in the field of inventions California holds a pre-eminent and honorable place, and her position in this respect is very largely due to the stimulus and encouragement given to inventive genius by the Mechanics' Institute of San Francisco.

The arts, manufactures and natural products of the State are finely exemplified at the Pavilion. There is much to interest the intelligent visitor, and any of our readers visiting the city will find there considerable of practical value. The exposition will be open till the 14th of next month.

A Letter from Mr. Ford.

TO THE EDITOR:—In view of the incomplete, and, therefore, misleading newspaper accounts of the meeting of the executive committee of the California Miners' Association last Friday evening, and in view of the published interviews contained in the papers of Sunday morning concerning the same meeting, I thought possibly a line from me might help to correct some erroneous impressions and contribute to a better understanding of the aims and purposes of our State Association.

The Association had its origin in the depressed condition of the mining industry consequent upon the suppression of hydraulic mining. Our gold output had been reduced about ten millions annually and the result was appalling, causing the abandonment of millions of dollars' worth of property, throwing thousands of men out of employment, and, in many instances, depopulating whole neighborhoods. A most bitter and hostile feeling grew up between the farmer and the miner and all hope for an amicable adjustment of the controversy seemed to have gone by. Then came into existence the California Miners' Association, which sought to proceed upon lines of fairness and to appeal to the good sense of the broad-minded citizens of our great State. The result was a source of both surprise and gratification. The weight and influence of the Association were at once felt in our State legislation, while the National Congress listened with respectful attention to our representatives. True, our progress was not rapid except in the matter of State legislation, which responded promptly to the call of the Association for legislative relief, but we felt an encouragement that had for many years been absent. There had also been some difference in opinion as to the shape congressional legislation should take, and, I confess, I was one who thought we might have proceeded on somewhat different lines; but these were differences which could, and doubtless would, have been harmonized after free and friendly discussion.

Then came the matter of the preservation of the mineral lands of the State, and to this subject the Association gave prompt and vigorous attention. There never has been, nor is there now, the slightest difference among the members of the Association as to the result desired, though there has been some difference as to the best method of obtaining that result. Those of us who had stood the brunt of the battle in the fight for the rehabilitation of hydraulic mining felt that we should use due care not to lose the ground we had gained in that contest, for we realized that there was much yet to be done, if not some things to be undone, before the mining industry of this State would be able to regain the position it once held and which its importance justifies. At several meetings of the executive committee of the Association suggestions had been made that a committee be appointed to confer with representatives of the railroad company and ascertain what could be accomplished by way of an arbitrament of the mineral land question. At the meeting of last Friday evening these suggestions took the shape of a motion providing for the appointment of such a committee. The motion was carried without a negative vote and the committee was appointed. Later in the evening, I regret to say, a discussion arose that developed into a debate characterized by some acrimony, and I must confess that it was not wholly free from bitterness of feeling. The prior action of the committee directing the appointment of a conference committee was reversed, and the committee on mineral lands was authorized to take appropriate steps toward a proper adjustment of the pending controversy touching mineral lands.

That this controversy may be speedily adjusted is certainly most desirable, and that the Association has appreciated the work thus far done is evidenced by the strong moral and financial support already extended to the committee on mineral lands. This committee has evinced much enterprise; and now that it is clothed with full power to act in the premises, we may hope for an early and a satisfactory settlement of the mineral land question.

This question once out of the way, the Association will be again in position to take up the cause that called it into existence, and, with intelligent, united effort, there can be no doubt as to the result.

Differences will always arise where any number of men are associated together, and we must not expect the Miners' Association to be an exception to the rule, and whatever of intense feeling may have been displayed at last Friday's meeting, let us take as an earnest of devotion to the cause and the anxiety of enthusiastic minds. I can see no reason why the Association should not wholly succeed in its laudable mission, and that it may do so I most earnestly pray, and to its accomplishment I shall unhesitatingly and unreservedly devote in the future, as I have in the past, the full measure of whatever of ability or influence I may possess.

Sincerely yours, TIREY L. FORD.

San Francisco, Aug. 13, '95.

Concentrates.

LOS ANGELES, Cal., and Prescott and Phœnix, Arizona, urge the establishment of mining exchanges.

THE value of the ore shipped from the mines of Kootenay for the twelve months ending June 30th, '95 was $1,491,811.

THE Derbec mine at North Bloomfield has finally closed, being worked out. The pumps were pulled up last Saturday and no more work will be done.

IT is figured that it will be September 1st before the water is all pumped out of the Utica mine at Angels. The mill is running on ore from the upper levels.

SEVERAL mining claims have been taken up at the mouth of the Salmon river, Idaho. The diggings are said to be similar to those at Gold Beach, Coos Co., Or.

GOLD BULLION can be assayed at the San Francisco Mint, but no ore. The only federal institution allowed to assay metal ore of any kind is at Charlotte, N. C.

THE Toltec Mining Company is organized at Phœnix, Arizona; capital stock, $200,000. Directors: D. M. Purman, J. H. Hunter, A. E. Martin, T. A. Orr, W. Webster, Phœnix, Ariz.

THE Bear's Nest mine, on Douglas island, which was recently reported as salted, is now being surveyed and thoroughly prospected. According to recent reports there's nothing in it.

A YEAR AGO Boston & Montana stock was plentiful on the Boston market at $26 per share, and some could have been had at a lower figure. Recently it was quoted in Boston at $81—a rise of $55.

THE Rebeka Mining and Milling Company has incorporated in this city. Capital stock, $500,000; all subscribed. Directors: John A. Paul, Moses Alder, Sanford Sachs, Aaron A. Adler and Samuel I. Sachs.

A BIG GOLD STRIKE is reported at the Carbonate mine, Oro Grande district, San Bernardino Co., at the depth of 200 feet. The mine is owned by Moulton, Fleming and Robinson of Los Angeles, and is said to show extraordinarily rich ore.

IT is a common occurrence at the Mint in this city to have a foreigner, visiting here, bring his gold to have it recoined. The charge is only $1 for 1000 ounces, which is virtually nothing at all, making it much cheaper than exchange.

AT Calico, San Bernardino Co., the Silver King Mining Company is reported reducing about 100 tons of ore daily. Its mines are the Oriental, Bismarck, Odessa and Occidental. It is stated that there is ore enough in sight to keep the mill occupied two years.

PROF. JACKSON, of the Nevada State University, is erecting a cyanide plant at the lower end of Silver City, Nevada, below the Dazett mill, for the purpose of working the tailings that have accumulated there for some years past. The tailings have been bought by the professor.

THE total exports of gold from Western Australia for the year ended June 30th, '95, was 239,593 ounces, valued at £910,426, an advance upon the value of the export for the year ended the same month of 1894, which was £560,263. For the six months ended June 30, 1895, the total output was 108,280 ounces, worth £411,465 6s 5d, and for the six months ended June 30, 1894, the yield was valued at £288,210. The total export of gold for Western Australia to June 30, 1895, is 563,128 ounces, valued at £2,139,809.

THE Minersville Hydraulic Gold Mining Company has organized at Wenverville, Trinity Co. Capital stock $1,200,000. Directors: Fred Beaudry, Weaverville; E. Cumenge, Paris, France; Count G. de Kergorlay, Minersville; E. Saladin, Junction City; H. Dugervey, San Francisco.

THE War Eagle gold mine at Trail Creek, British Columbia, affords a striking illustration of fortune quickly realized. The bedrock price of the stock was about six cents, the mine itself costing less than $30,000, but it has already paid dividends of $150,000. The shares are quoted at $2.50 each, and the mine is in better shape than ever.

THE Idaho Gold Mining and Smelting Co., of Butte, has been organized; principal place of business operations will be at Trail Creek. The company is capitalized at $500,000. The Center Star Mining and Smelting Co., of Butte, also organized, to carry on a general mining, smelting, milling and reduction business at Trail Creek; capital stock, $500,000.

THE Nogales, Arizona, *Oasis* says the turquoise mine in Cochise county is doing well. The product commands $8 per carat, equal to $11,360 per pound, in the New York market. A shipment of thirty pounds is about to be made. Assorting and cleaning will reduce the weight somewhat. There is only one other turquoise mine in this country, and that is in New Mexico.

THE Portland, Or., *Oregonian* of the 7th inst. has a detailed and circumstantial account of the finding in a California watermelon of "streaks of pure gold," which by nature's subtle alchemy had been transmuted from the auriferous soil in which it grew. Next thing we know the nuggets found in the gizzards of Oregon chickens will be reported larger than usual, and another gold quartz ledge will be reported in Oakland.

IN explanation of last week's shipment of $10,000,000 in gold bullion from New York to Philadelphia, Director of the Mint Preston says that it is the present purpose of the Government to coin with reasonable rapidity all of its stock of gold bullion. This amounts to nearly $60,000,000, about all of which is in New York, Philadelphia and this city. There is said to be no special significance in this order for the coinage of gold bullion, it being solely for the purpose of making it available for all purposes.

REGARDING the sale by the administrators of the Fair estate to Pierre Humbert Jr. of Boston of the estate's one-half interest in the Pioneer mine, in Placer county, suit is to be brought to partition the mine between the estate and A. E. Davis, owner of the other one-half. Humbert agrees to bid at the partition sale a sum which will yield the estate $72,500, and to secure his promise has made a deposit of $75,000 with the First National Bank. Should Humbert fail to carry out his agreement, the $75,000 is not to be returned until he shall indemnify the Fair estate for all loss or damage sustained by reason of his breach of contract. The mine has yielded $381,800, and is considered cheap at $150,000.

THE Slate creek, Wash., boom is burst. The Montana syndicate spent $50,000. They wanted the country thoroughly prospected. They were on the ground and if any finds were made and there was a permanency to the country they had the money to bond the mines and secure control of the property. As a result, 3000 prospectors went into the country and every foot was gone over. All of the locators were anxious to give the syndicate long-time bonds on their locations, and the extensive development work done on the Eureka showed that the mines could not under existing conditions be worked successfully and they withdrew. Everything is at a standstill. Work has ceased, and few people are left in the country. There is plenty ore, but it is too low grade.

RECENT Colorado mining incorporations are the Enterprise Gold Mining Company of Pueblo, incorporated by B. Donahue and Frank Clink; capital stock, $100,000. The Atlantic Mining and Milling Company, incorporated with $1,000,000 capital stock, to operate in El Paso county; incorporators, F. Buck, F. A. Morath and C. Newer. The Hudson Gold and Silver Mining Company; capital stock, $1,000,000, to operate in Crystal, Gunnison county; incorporators, B. S. Phillips, L. H. Pike and G. C. Eaton. The St. Paul Gold Mining Company, at El Paso, with offices at Manitou; J. O. Hardwick, A. G. Lewis and W. H. Rogers, incorporators; capital stock, $100,000. The Colorado Gold Mining Company; capital stock, $100,000, Denver; incorporators, C. Bleibel, P. Feldhauser, M. Barth and O. Sauer.

THE Trail creek miners have concluded 'tis useless to strike for $3.50, and now claim to have discovered that the Canadian law provides a method of arbitrating differences between labor and capital. As a result, the Commissioner of Conciliation and Arbitration of British Columbia has served notice on the mine owners in the Trail Creek district that the miners desire arbitration on the wage question. It is said the miners will seek to prove at this conference that the mine owners are able to pay $3.50 per day; that the mines are yielding big profits; that the cost of living is greater than in the camps on this side of the line, and that, in view of the fact that $3.50 is the standard wages in Montana, they ought to be paid that much. If the mine owners can afford to pay $3.50 they will; if not, they will shut down, as in the Cœur d'Alenes and elsewhere.

IT will be necessary for the people of South Africa to hunt up some new mines at no very distant day in order to keep up the excitement in regard to that country. The mines at Johannesburg are what would in California be called drift diggings. The pay lies in the gravel on and near the bedrock. This pay streak of cemented gravel averages about three feet in thickness. This small streak is all that contains pay, though there are hundreds of feet of gravel and other material above. The pay streak is fast being drifted out. Little pay is left even now in some of the older claims near the edges of the basin. It is for this reason that the English in London are trying to work off the stock of several mines among the French in Paris. As the rim of the basin in which the gravel deposit lies descends at an angle of about 70 degrees, depth is rapidly attained. Surveys show that the flat bottom of the basin lies about 5000 feet vertically below the surface. That will be a great depth to go for a three-foot streak of low-grade gravel. Of course the bottom of the old lake basin may lie at even a greater depth.

Mineral-Bearing Veins.

"Under the general terms of 'ores' is comprehended all minerals and mineral aggregates which, from their metallic contents, attract the attention of the miner," says a leading mining authority. The idea of "ores" and "metalliferous deposits" cannot be expressed in a more precise manner. Under this head, indeed, are included all native metals, metallic oxides, metallic sulphides, and even metallic salts and their combinations. "Lodes" are aggregations of mineral matter in fissures in rocks. The fissures are the result of volcanic or plutonic action. The rock in which a mineral vein or lode occurs is called the "country rock," or "wall rock." The sides next to the vein are called the walls. When the vein is not perpendicular the wall over it is called the "hanging wall." The extension of a lode in a horizontal direction is called "the strike," and the angle which it makes with the plane of the horizon the "dip." The "outcrop" is that portion of the vein which appears above the surface.

The breadth or size of veins varies greatly. Some are no thicker than a sheet of paper, while others are several hundred feet thick. As a rule, most payiug veins average from six inches to five feet in thickness. The grout in which the Comstock lode is formed is iu some parts several hundred feet iu width. All the filling within this fissure was not "ore," however, there being much quartz, clay, porphyry and other barren material called "vein matter," which contained but a small percentage of the precious metals. This is generally the case in all mineral veins of great width.

As a rule, says Dan De Quille in the Salt Lake *Tribune*, lodes occur associated together, so that when one lode has been discovered there is a great probability that others of a similar character—be they gold, silver, copper, lead or iron—will be found in the same neighborhood. The lodes are generally arranged in groups approximately parallel to one another. Mineral veins are usually found in regions in which igneous rocks have burst through crystalline schists or stratified deposits. In a general sense they belong to the contact phenomeua of igneous rocks; that is, to places where the igneous rocks are in "contact" with those of a sedimentary uature, in consequence of which they are much more frequent iu mountainous regions than in plains, since the upheaval of igueous rocks has commonly caused the elevation of mountains, either directly or in consequence, and the upheavals have generally been through stratified rocks.

But all lodes are not found iu places where igneous and sedimentary rocks are in contact. Sometimes the veius are situated between two igneous rocks of a different character. Lodes occur more frequently iu rock formatious of great age than in very recent ones. Certain classes of them, as the lodes of tin ores, are found only in the oldest rocks. Thc tiu deposits in the Black Hills, those in Cornwall, in Australia, and in the Temescal mines in Califoruia, are all in the oldest of the igneous rocks. The more recent the formation of the igneous rocks so much the more rarely are they accompanied by lodes, the very recent only by lodes of iron ore. Miueral veins of value are hardly ever found in recent volcanic deposits. It may be said the greater the age of rocks and formations so much the more frequently are they, as a rule, traversed by lodes. However, if we collect all the facts in regard to the age of lodes in general, or in separate classes of them, we shall find there is no limitatiou of their origin to particular geological periods.

If the same age should be ascribed to all bodies similarly composed it would follow that all auriferous bodies should be cousidered as belonging to the Tertiary, or a still more recent period, and a large class of silver lodes as being younger than some deposits of the Cretaceous. Such a supposition cannot be strictly refuted, but it does not coincide with the general occurrence of such lodes. It appears more natural to assume that the formation of various kinds of lodes has been taking place at all periods siuce the crust of the earth has existed, but at various depths. Whether generally in thc same or in a decreasing ratio must, as being undecided, remaiu questionable. And further, that this has taken place, now in this, then in that district, according to circumstauces conditioned by general geological events, as a consequence of which the older rocks and deposits more commouly coutain lodes than the recent ones, which were not so long subjected to the possibility of lodes being formed in them.

Were various lodes forming during all periods of time, but at unequal depths, it would then, as just remarked, be easily compreheusible that the oldest rocks and formations were commonly most affected by this continuous event, being longest subjected to it.

It is just as comprehensible that the kinds of lodes belonging to the greatest depths can only become accessible to our observation and to mining where what was ouce deep in the interior of thc earth has reached the surface by upheaval and erosion of what lay above it. A longer period, as a rule, was necessary to raise such deep inner regions to the present surface of the earth, and to destroy the mass lying above them, than for the less deep formations. It is, therefore, very natural that the lodes formed at the greatest depths should appear to be relatively the oldest, precisely because the most time was necessary to lay them bare, which could but seldom be replaced by greater energy of uphcaval and erosion. Thus it is supposable that the formation of all kinds of lodes is still taking place, but the majority generally at such depths that we cannot observe them, and different kinds of unequal depths.

Since, as was stated at the begiuning of this article, all true lodes are aggregations of mineral matter in fissures, fissures must necessarily have first been formed and then filled. Both operations may have been independent of each other, and even when this is probably not the casc, still the formation of the fissures was an entirely different operatiou from that of their being filled with mineral matter.

Even the purely mechanical operatiou of the formation of fissures has been explained in very different ways. Werner considered fissures to be in consequence of compression caused by specific gravity, by the drawing off or separation of the rocks in the directiou of the exposed side, by the contraction caused by drying, and by concussion caused by earthquakes. Fox explained them as being consequences of electrical currents in particular directions, and on this account thought they were originally formed at nearly right angles to the direction of the magnetic meridian. Others have considered them to be consequences of the cooling of the globe.

While it must be granted that fissures could have been formed in all these ways, and perhaps really have been so formed ever since the earth had a solid crust; while in this it may further be granted that a fissure formed in this manner has been exceptionally filled with minerals and ores, it is still more probable, as Van Buest in his criticism of Werner's theory has clearly shown, that the majority of lode fissures have been torn asunder by concussions caused by volcanic or plutonic activity, or, in other words, by volcanic or plutonic earthquakes. Even at the present time earthquakes produce eutirely similar fissures, which are frequently formed in groups, like those of lodes; and in so far as they are caused by a similar concussion, run parallel to oue another.

Many vein fissures have probably been repeatedly torn open, or have been widened during the process of filling. This last operation seems sometimes to have taken place as a consequence of the expanding process of crystallization in the lode fissure.

The manner in which lodes were filled is a subject in which hypothesis still has free scope, and which must be treated, as far as possible, in a manner guided by the limits of observation as well as by the application of known laws. It is now conceded that the majority of mineral-bearing veins are formed either by sublimation or infiltration, very few persons at present holding to the old theory of the injection of molteu matter. Indeed, Plattner, Daubree, Durocher and others have not only succeeded in producing quartz artificially, but also the ores of iron, lead, antimony, silver and several others. This was done through sublimation by heat aud condensation in a proper receptacle. Hot miueral springs are important assistants, if not indispensable requisites, in the formation of mineral veins. At Steamboat Springs, Nev., a large mineral vein is undoubtedly in process of formation. So slow is this process of formation, however, that to have produced a lode such as the Comstock must have required ages almost beyond computation. At one time, ages and ages ago, the hot waters found in the Comstock lode at a depth of from 1000 to 1500 feet must have reached the surface along the line of the vein. Ages ago the subterranean fires and forces directly beneath and about the great lode were much more active than anything of the kind at present in existence in or about any hot spring in the country. The upheaval of the vast mass of syenite forming Mount Davidson must have brought up to near the surface from the depths intense heat that endured for ages. There are indications that the mountain did not come up at once, but by several impulses, with probably thousands of years between each. Thus at each upward movemeut there would be a new accession of heat and fresh and broader rents in the superiucumbent propylite iu which the first fissurc of the lodc was formed—that along which croppings appear.

All lodes have not, however, been formed in the same manner. Not a few show that they owe their existence to aqueous solutions, while iu others evidences of condensatious from sublimations of gaseous emanations predominate. In great veins, such as the Comstock, there are nearly always to be found proofs of the work of formation and filling having been done at widely different times, as well as through different agencies, aqueous forces being at one time in the ascendancy, and the gaseous, with sublimations from great and deep-seated heat, predominating at another.

Besidcs all this, all mineral lodes are subject to transformation after formation. Nearly all, therefore, have reached our age after having passed through a variety of influences. Aqueous deposits have been rent open aud changed by plutonic forces, and by receiving additional deposits from sublimatious, or by aqueous precipitations and infiltrations. Evidences of all these different modes of deposit are to be found in the Comstock lode. It has several times been opened and reopened in parts under widely different influences and conditions of subterranean pressure aud volcanic or plutonic disturbance.

To say nothing more about the formative process by which the Comstock was filled and mineralized, there is evidence that some of the forces through which the production of the lode was effected are still in operation. The internal fires beneath the earth's crust are still active, heated water is still being forced up and put in circulation among the rocks as a solvent, and the rocks themselves are kept at a high temperature, which, as all chemists know, is favorable to condensation by crystallization. As the machinery in the workshop is still in operation, it must be that some work is being done. The progress of this work, however, may be so slow as to be almost imperceptible, and incapable of computation through measurement, unless a special study of it should be made, extending over a great number of years—perhaps from generation to generation of man and age to age of the earth.

Observations made in all parts of the world have shown that deposition of ores is not only affected by the kind of rock forming the walls of a vein, but also by the accideutal conditions of that rock—as its roughness, smoothness, solidity and form, irrespective of its uature and components.

Aqueous vapors no doubt contribute most to the formation of quartz, aud gaseous and sublimated emanations from metals in fiery depths most to the formation of ores of the metals in connection with quartz, though much iu the way of mineral matter is doubtless deposited by chemical action from solutions of minerals in heated water.

What is seen on a small scale on the Comstock in the way of lode formatiou is to be seen in California on the western slope of the Sierra Nevada range, in the great "mother lode," on a scale of astonishing vastness and extent. There, by the upheaval of the granite mass of the Sierra, and the accompanying dykes of igneous rocks through slate and other stratified rocks, has been formed an auriferous lode that stretches along the western slope a distance of not less than 120 milcs.

Whether the Sierra range was thrust up to its present height by a single mighty convulsion or by a serics of upheaval impulses, the results would be the same; therc would bc made an opening between the rising igneous mass and the slates and other uplifted stratified rocks similar to that made on the Comstock between the syenite of Mount Davidson and the propylite which it lifted.

All fissures have not been formed by the obtrusion of igneous rocks; some are due to the shrinkage of the crust of the earth, while others have been formed in ways already mentioned. However, the first requisite to the formation of a mineral lode is the fissure, and thc second is that the fissure shall reach down to heated regions where exist miueral-charged vapors and gases—a subterranean laboratory in regard to the naturc of which all is mere conjecture.

Upward through such a fissure would pour from deep-seated, heated regions the vapors of miuerals, mineralized gases, and, probably, in the first stages, great quantities of hot mineral-charged water, and thus would be commenced the work of filling the fissure—the formation of a mineral lode.

The Wet and Dry Seasons in California.

To the Editor:—The periods of the year in California are more generally spoken of as the wet and dry seasons rather than by the name of one of the four seasons in vogue in the greater portion of the world. The term "wet" does not in this sense mean continuous wet, nor does the term "dry" mean no rainfall. They are used in a comparative sense and mean, the wet season that rain is more probable, and the dry season that no rain is more probable, than the reverse. This paper is based entirely on the rainfall at San Francisco, which is very close to the mean between the heavy and light raiufall of the State; hence it represents very largely the whole State. Rain has fallen every month of the year at San Francisco. August has a mean rainfall of 0.01 of an inch, July 0.02, September 0.22, June 0.25, May 0.73, October 1.25, and the other months have averages of from 2 to 5 inches. From May 1st to October 1st, five months, have an average rainfall of 1.23 inches, and the remaining seven months have an average of 22.70 inches, making an annual average of 23.93 inches.

The First Rains.—At the present time, August 1st, we are in the middle or a little past the middle of the dry season, and it will not be long until many will be making inquiries as to the commencement of the rains. Cousidering the record of the past twenty-five years, made in this city by the United States Weather Observer, it is found that the average date of first 0.05 of an inch of rainfall occurs by September 17th. Considering June 30th as the official end of one season and July 1st the commencement of the next season, we find that the earliest date of 0.05 of an inch of rain is July 8, 1885, and the latest October 27, 1875—that is, from July 1st to October 27, 1875, only 0.05 of an inch of rain fell. As 0.05 of an inch of rain is such a small amount, it has been deemed best to consider that when one-quarter (0.25) of an inch of rain has fallen that that date be

considered the commencement of the rainy season. Using this then as a basis, we find that the rainy season begins on October 8th. The earliest date of a quarter of an inch is September 8, 1884, and the latest not until November 23, 1880.

As one-quarter of an inch of rainfall at San Francisco is hardly sufficient to allow of rainfall over the southern portion of the State, a basis of one inch at San Francisco was considered for the southern portion as the commencement of the rains there, and this is found to be November 1st. The earliest date of one inch of rain is September 15, 1888, and the latest December 3, 1890.

One inch of rainfall at San Francisco is not sufficient for the interior of the State to allow of good plowing and seeding; hence a total of 2 inches at San Francisco was considered, and it is found that 2 inches of rain falls at San Francisco up to November 1st; hence that date can be said to be the date of commencement of good plowing.

Five inches is cousidered as the rainy season being here in full effect, and it is found that 5 inches does not fall before December 15th, and that the earliest date that 5 inches has fallen is October 21, 1889, and the latest February 5, 1891. In this latter season February was very wet, and the total for the season was 17.58 inches.

To summarize, we have first rains September 17th; rainy season begins October 8th, and in southern portion of State November 1st; ground moisteued for plowing November 13th, and rainy season in full effect December 15th. These facts have not been presented heretofore and may be found of interest and value to many, for they show the average of the past twenty-five years. The greatest seasonal rainfall at San Francisco was in '89-90, when 45.85 inches fell, the least being 11.04 inches in '76-'77.

Why We Have Wet and Dry Seasons.—In this connection the causes of these seasons and the cause of this great variation in the amount of rainfall may be of interest. The amount of rainfall in California is dependent upon the north or south deflection of the storm areas. The food of a storm is heat and moisture. With the approach of the summer months the heat is increased, and with this increase of heat the moisture becomes less, hence the storm areas retreat northward to obtain their greater supply of moisture. As the storm areas seek their more northerly path the rainfall over California becomes less and less, and with the passing of the summer heat the path of the storm area moves southerly and the rainfall then increases.

The normal path of storm areas across the Rocky mountains from November to April is about the 50th degree north latitude, and when the path is south of this latitude the rainfall over California is increased; when to the north it is decreased. From April the path of the storm areas (areas of low barometric pressure are called cyclonic or storm areas) moves northerly until July and August, when it is at its farthest point north, which is about or above the latitude of Sitka; from August they advance southward and the rain then begins in the north—in British Columbia—then in Washington and Oregon, and finally in California. The daily weather map is now distributed to nearly every town in California, and will be sent to more places, free of charge, if requested. By a study of the map, observing the progress and course of the storm areas, marked "Low" on the map, the public can form very good ideas as to the approach of the rainy season. So long as the "Low" is not seen off the northwest Washington coast there need be little or no fear of rain in California, but when it appears there then rain over California is probable and is made possible by the "Low" moving southward along the coast, the barometer falling over California and the winds backing or shifting to the south and southwest.

South Winds and Rain.—Rain in California, unless it is a local shower, seldom occurs with winds from any point of the compass except the south, southeast or southwest. This has caused the idea among some that the rain came from the south. This is an error. The causes which produce the rains come from the north, though the winds are southerly. The air is light and with an upward movement, like the draught up a chimney. In a storm center the air from the surrounding sections moves spirally inward to fill up this lightness or hollow in the atmosphere. As storm areas move southward along the coast from Alaska and cease their southerly movement about the Columbia river, the wind to the south of the storm centers are southerly. They blow into the storm area, give it more food or energy, and the influence of the storm is extended southward, allowing the rain to fall over California. The more extensive the storm area and the greater the depression of the barometric pressure the greater will be the area covered by the rain and the stronger will be the force of the wind. From this brief explanation it can be seen how valuable are the weather maps, even though they reach the recipient thirty hours after they have been issued from this office. In the summer months the storm areas are so far to the north that their influence cannot extend so far south as California, hence the dry season; and the longer the storm areas remain in their northern location the longer will be the dry season.

Heavy and long continued rain periods over California are caused by the greater diameter of the storm and a resistance or barrier in the path of the storm which prevents its easterly movement. This barrier is an area of high barometric pressure over and to the north of Montana.

The foregoing is a brief outline of a subject which, if thoroughly treated, would make many pages, which would be too long for general distribution. It is hoped, however, that this may give a fair understanding of the subject.

B. S. PAGUE,
Weather Bureau Office, Local Forecast Official.
San Francisco.

Mining on the Colorado.

TO THE EDITOR:—Mining along the Colorado river is taking on new activity and awakening an interest among mining men never experienced before in this section.

The old Figueroa mine at Pot Holes has been sold for $35,000 to Davis, Wetmore & Co., who will erect a ten-stamp mill on it. The shaft is down 70 feet; vein 4½ feet wide in good ore. A mill will be put on the Dahlonega mine at Buena Vista, four miles above Pot Holes and sixteen miles above Yuma, by Beatty & Co. It is owned by San Francisco parties.

The new discoveries at the Delgado ranch, opposite Buena Vista, on the Arizona side of the river, continue to look well. Mining capitalists have plans in hand for the erection of a large smelting plant at Castle Dome for the reduction of the lead and silver ores from the mines in the Castle Dome mountains, twenty miles east of the Colorado.

In the Picacho White Gold Basin, on the California side of the river, the prospects are most flattering. Wherever the mines have been opened it has been with good results. The Gold Chain mine shows a solid face of $10 ore sixteen feet wide with but one wall in sight. The Gold Prince shows from ten to fifteen feet of good ore. The Jaeger mine at forty feet in depth shows a vein four feet wide. The work on the Silver King now being done by Adams & Curtis shows a vein of ore from sixteen to twenty feet wide which runs well in gold, silver and copper. This is the first mine of this kind carrying these metals in combination found on this side of the river in the White Gold Basin. The owners are now sinking a shaft on the vein which is opening well. The Silver Queen and Walla Walla, both on the same belt, are showing up well. The ore is rich; veins fifteen to twenty feet wide.

The rich discovery made last week in the Picacho Basin, two miles west of the White gold mines, is considered the most important ever made on the Colorado river.

When placer gold was discovered at Picacho thirty-four years ago a large amount was taken from the surface of a belt of barren, bastard, dirty-looking quartz that reached across one corner of the basin, about 700 feet wide and 3000 feet in length. It was always a great mystery where all this gold could have come from, as the quartz was barren. Last week some placer miners struck a small but rich pay streak on the side of a shallow gulch, about twenty feet from the line of the famous old Mars mine, in ground always considered barren and valueless. It run in under the quartzite on the brow of the gulch and they quit it. Some quartz miners thought they would run an open cut across the top of the hill, and, beginning where the placer miners had stopped work, they soon found that at twenty inches in depth they had ore that would pay $5 to $8 per ton. Ten feet farther ahead and two and a half feet deep they had $15 to $18 ore. When they had run twenty feet and were three and a half feet deep the ore paid $25 to $30. They sunk a shaft at the end of the open cut. At ten feet the ore run $25 to $50, and from seventeen to twenty feet in depth the ore carries $50 to $150 in free gold, and growing richer as they go down. The croppings of this immense vein are more than 700 feet where it crosses the Mars mine, and the 3000 feet in length covers three or four other mines. This basin has turned out more than $7,000,000 in placer and $3,000,000 from its quartz mines, of which $2,876,510 was from the Mars, Venus and Goshen mines. It is now no longer any mystery as to where the placer gold came from. It was fine but rough just as it came out of the quartz. The new find now shows a body of ore twenty feet in depth, growing richer as depth is attained, and twenty feet in width, showing neither wall nor signs of any. The ore is a fine-grained, rose-colored quartz, very easily crushed. The discovery adds great value to mines heretofore considered of no great importance and sends the Mars and Venus group up to severe figures in value.

The Gold Rock mines, near Ogilby, continue to hold the field as gold producers. The forty-stamp mill still gets away with its 100 tons of ore per day. The new 100 stamps will soon be ready for work. The mine is down 400 feet with $10 ore in every direction for 100 feet, and no walls nor signs of any; promises to be a bonanza for years to come. It is not to be wondered at that those who were offered this valuable property less than three years ago for $12,000 should now smite themselves on both cheeks for their ignorance of what a good mine should consist. It is not the first time they have done so. No less than a dozen other good mining claims have changed hands in this section within the past three months. The Old Blossom has been put on its feet again and promises to enter the ranks of the best gold producers in this section. Three large mills are already contemplated for this district during the coming winter.

With these and the four or five new mills that in all probability will be put into the Picacho and White Gold Basins, the coming fall and winter, together with those at Pot Holes and Buena Vista and the southeast corner of California, the great free-milling gold belt of the State and of the Colorado river will come into prominence as one of the great gold-producing districts of the Pacific coast, in which the chances to-day of securing promising claims and undeveloped properties are the best that I have seen for years.

Messrs. Koumtze and Shoedy, the Denver, Colo., mining capitalists, have done 186 feet of shaft work on the Ararica mines on the California side of the river, twenty-two miles west of Ehrenberg, with promising results. It is reported that they will put up a large mill on the river for reducing their ores. The outlook along the Colorado from Yuma up never was as promising for mining as at the present writing.

N. Y. Daily Financial News.

Mining Summary.

CALIFORNIA.

Amador.

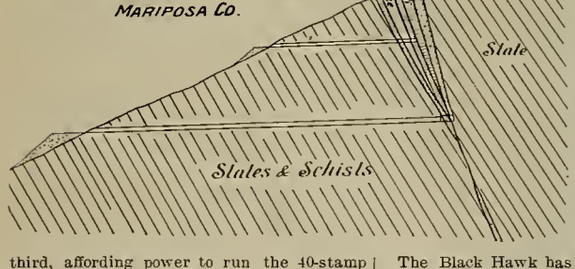
THE DOYLE AND ANITA.—*Republican:* J. B. Doe of San Francisco and W. Moore of Sonora have bonded the Doyle property in Hunt's gulch for two years for $35,000, with the option of taking the mine for $25,000 by paying the whole of that amount in nine months. The bonders have to pay the owner, W. Doyle, $75 a month during the life of the bond, which payments will be credited on the purchase price in the event of a sale being consummated. Work is to be commenced within sixty days from the execution of the agreement. It is the intention to sink a shaft to a considerable depth and give the property a fair exploitation, and if this can be done there is every reason to believe that it will develop into a paying property.

ANITA —The ledge which is being followed north and south on this claim at the depth of 200 feet has widened out to six feet. The company will proceed with development work. The ore body is wider at the floor than it is at the roof of the drift. This shows that the apex of the vein has been encountered, and furnishes ground for the belief that the ledge will show up much stronger when greater depth is reached.

Butte.

AROUND MAGALIA.—An incline has been sunk in the Aurora to bedrock and a tunnel is being run to tap the old works. This tunnel will be forty feet in length. As the old works are filled with water it is a dangerous operation to tap them. Search drills are used for this purpose and these are run to the right and left as well as in front. As soon as the water is struck it will be drawn off in limited quantities so as to avoid danger. After the drills have been run a blast is put in and when the debris has been cleared out the searching again begins.

At the Magalia shaft it is thought that the machinery is not powerful enough to handle the pump and do the required work and a new plant may shortly be put in.



At the Alki mine they are pumping, putting in new pipe, erecting new buildings and getting things ready for operations. Messrs. Merry and Parry are the owners.

N. A. Harris is running a tunnel on the Wylie Bros. mine.

John. D. Williams is taking out good pay in the Golden Drift.

Mariposa.

AT HITE'S CAVE.—The Hite Gold Mining Company has put in a duplex air compressor; the ditch and flume have been enlarged one-third, affording power to run the 40-stamp mill. New hoisting works are building, and the mill is being put in order to crush ore. The mill is about 3000 feet from the mine and 500 feet below the tunnel level.

THE REDBANKS CO.—*Gazette:* The Redbanks Mining Company is building a dam and a large flume across the river and is pushing development work on the mines. About fifty men are on the payroll. A large amount of machinery and materials have been hauled in during the past ten days by way of Bear valley.

Nevada.

A FLOURISHING MINE. — *Transcript:* The cleanup at the Providence last month was the largest in the year. The mine is in a flourishing condition, and the owners are highly pleased with the outlook. Forty stamps are dropping continually, and the ore chutes are full. There is ore enough in sight in the stopes to run the mill for six months at least.

OUT OF DEBT.—*Transcript:* The cleanup at the Harmony mine yesterday was one of the largest ever made there. To-day the company paid off a mortgage and the property is now free from all incumbrances. Splendid gravel is being taken out right along, and very soon the stockholders will doubtless begin receiving dividends. The company have ground sufficient to last five years. From the developments made in the Harmony and West Harmony mines it has been demonstrated that the channel extends up the ridge, and it is only a question of a short time when work will be started on the different claims that are located along the ridge.

A NEW 20-STAMP MILL.—*Union:* Inside of a week's time men will be at work tearing down the old mill at the Wyoming mine, which adjoins the Champion and is owned by that company.

As quickly as possible the work of erecting a new 20-stamp mill will begin. The company has been figuring on this for some time and it will be gratifying to know that the work is about to commence.

Superintendent Zeitler is a zealous worker and will have things in fine shape at the mine when the new improvements are completed. At present the company has thirty stamps dropping night and day, and when the new mill is completed there will be fifty stamps.

Plumas.

LA PORTE AND GIBSONVILLE.—*National:* The Thistle shaft is now down 500 feet; 150 hands are employed. The company will soon begin operating on the Plumas side of the ridge, when a greater number of men will be employed.

PLAN OF THISTLE MINE WORKINGS.

From 1880 to 1892 the Pioneer mine at Grass Flat yielded $400,000. Since then it has paid better than ever. Dissen & Cowdery of San Francisco are the owners. Eighty men are employed in the mine.

The Alturas mine, owned by Packer & Hendel, has thirty men. The gravel deposits are on Slate creek and are worked by means of elevators.

J. H. Thomas has put three shifts of miners at work on the Clayhank tunnel, which will be extended 590 feet to develop the Gibsonville ridge channel.

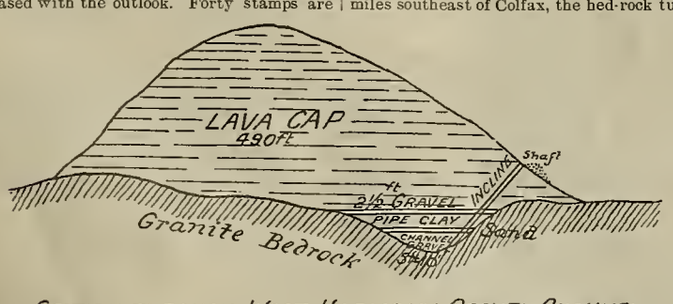
A new tunnel 1000 feet long will be run on the South Fork mine, of which Mr. Bainbridge is superintendent.

Twenty-five men are employed in preliminary work on the Gold Bar mine.

Placer.

THE PIONEER MINE.—Forty-eight men are on the payroll of the Pioneer mine. The new tunnel, 520 feet below the present working tunnel, is now in over 400 feet. It must be run 1500 feet to strike the Pioneer ledge and a total of 2600 feet to strike the Linn vein of quartz. A new compressor has been put in to run the drills. The company expects to have forty additional stamps by the end of this year.

ON THE NORTH FORK.—The Boston company which purchased the Pioneer has completed the survey for a wagon road from Towle.



The Black Hawk has fifteen men at work under direction of Superintendent Blood. Goodall, Perkins & Company have secured a proprietary interest in a portion of this mine under an agreement to develop the property and erect a ten-stamp mill. The ledge is from 3½ to 7 feet in width.

E. A. Frenzel, of San Benito county, has a bond and two years working lease on the Dorer ledge. This mine now has 3200 feet of tramway and a ten-stamp mill located on the river below. Mr. Frenzel is backed by the Bank of Hollister. If the ore holds up to the present indications he will build a new tramway and commence operations on an extensive scale. Five men are at present working on the ledge.

GENERAL MINING NOTES.—At the Bonanza Slide Drift mine, two and three-quarters miles southeast of Colfax, the bed-rock tunnel is in 225 feet. A 10-foot breast of gravel has been struck. Thirteen miners are employed.

The Hidden Treasure Company has men retimbering the old tunnel at the Mountain Gate at Damascus.

The Hathaway mine at Ophir is leased by M. Jones, of this city, employs forty men and A. B. Eastwood is superintendent.

SECTION THROUGH WEST HARMONY GRAVEL CHANNEL, NEVADA COUNTY.

Riverside.

A SUCCESSFUL RUN.—*Record:* On Wednesday the Good Hope mill made a run on two tons of ore from Smith, Hamett & Hancock's Federal Loan mine. The ore was selected and taken from the pay streak of the ledge. The run netted 11 49-100 ounces of amalgam, which, at $15 per ounce, a safe estimate, gave a net result of $172.35. The owners of the mine a reconsiderably elated over the result of the run and will immediately put several men at work on the property developing and taking out ore.

AT THE SANTA ROSA.—Orders were given at the Santa Rosa mine Tuesday to begin sinking on the main shaft, and work will be pushed with zeal till a depth of 1000 feet is attained. Should the ledge hold out to that depth, and it is to be hoped that it will, it will settle beyond any question of doubt the permanency of mining in this district.

IRON MOUNTAIN DISTRICT.—The *Enterprise* reports the sale of several mining properties by C. H. Gray to Alonzo M. Wells. The mines sold are: The Arica, Red Butte, Lometa, Frixie, Gray Eagle, Alahama, Colorado, Washington and St. Louis, all located in the Iron Mountain district. The consideration is said to be $40,000.

San Bernardino.

GENERAL MINING NOTES.—The Lone Star Mining District is eight miles north of Leach's Point and about seventy miles from Daggett. Ore is reported found there assaying from $75 to $250 per ton.

The Holcomb Valley Company is running its dredges and amalgamators to only about one-tenth their capacity, owing to a scarcity of water. Superintendent Thame is sinking for water.

The Rose is shipping its high grade ore. The five-stamp mill is kept busy on the low grade rock.

MORONGO.—In the Morongo mining district, the Altura Mining Company has ordered a five-stamp mill which will be put up at once. The Morongo King Mining Company is still prospecting.

Shasta.

THE IRON MOUNTAIN SMELTER.—*Democrat:* About forty men are working at the site of the new Iron Mountain Company's smelter. The site is on a flat extending from near the Skillen place to the bank of Spring creek, and a little over two miles from Shasta. The workmen have already graded out and leveled up the old placer claim, and have about four acres graded.

Siskiyou.

GENERAL MINING NOTES.—The Fernandez Company, at Cherry Creek, have cleaned up this season's sluicing. The result is near $12,000—better than last year's cleanup.

The miners on the lower Klamath at Hamburg, Seiad and Happy Camp are doing well and expecting to realize considerable gold.

Eastlick Bros. and Wright & Fletcher, at Oro Fino, have made their cleanups from the past spring and summer work with hydraulic giants, with better results than last year. There is considerable snow yet on the highest peaks of the Salmon range to supply the ditches with water, but the hot weather causes it to evaporate almost completely before reaching the diggings, as the ditches are several miles in length.

The Horse Creek diggings, in Oak Bar district, will be worked right along, as the ditch is ready to furnish a good head of water for the giants.

Sierra.

THE GOLD BLUFF MINE.—Work has been resumed at the Gold Bluff mine, on the north fork of the North Yuba river, one mile above Downieville. Up to 1890 this mine produced $250,000. It was afterwards sold to a New York company for $100,000, and since then has yielded more than the purchase price. A twenty-stamp mill and other works were put up at an expense of $40,000. The property was levied on by the miners and other creditors. John Costa of Downieville was a large creditor and he bought in the other claims or liens and foreclosed on the property. He is now operating the mine, having twenty men employed and expects to make it pay, as there is plenty of good ore in sight.

THE LAST CHANCE.—Henry Goeriog, of Sierra Valley, who owns the Last Chance hydraulic mine, three miles above Mohawk, has his own water right, a ditch five miles long; has plenty of fall for the tailings, and has a new brush dam which has been accepted by the Debris Commission. The claim comprises 200 acres.

Trinity.

A PROMISING SECTION.—*Record:* At Minersville, in addition to the property now operating under the auspices of the French company, there are other properties which in all probability will sooner or later be worked on a large scale.

On the north side of Haywards gulch F. Bates has twenty acres of rich gravel; next adjoining are the forty acres belonging to Joe Kapusta; next to the last-mentioned are the ninty acres belonging to John C. Van Matre and Wm. Crandall; then there are 160 acres belonging to John C. Bolton, John Dodge & Co., and the Haywards Flat placer mines of 160 acres.

Where it has been drifted it has paid well. It could be worked by hydraulic elevators to advantage.

In one part of the flat about one-eighth of an acre cleaned up $1000. The average depth is about 60 feet, of which there are about 16 feet of gravel, which prospects from a few colors to 15 cents to the pan.

Van Matre & Crandall last winter piped down to a sediment about 25 feet above bedrock, and no lower.

The Bates claim has been drifted in places, and has paid as high as $80 for four hours' work. Inexperienced drifters have taken out $700 there in one week.

After $5000 had been taken out, the tailings were washed over and produced $350; the third washing paid $125, the fourth $60. This was done by Joseph Kapusta, the former owner, who sold it to F. Bates.

The Beaudry water right covers all of the above ground, where a pressure of 600 feet could be had if desired.

Owens, Waite & Co. at the bottom of their shaft obtained prospects of 28 cents to the pan, at the lower end of the flat in a straight line below the Bates claim. The bedrock is of rough slate.

It is estimated that an expenditure of from $80,000 to $100,000 would place 4000 inches of water all the year round with a good pressure on all the gravel benches from New River to South Fork. This part of Trinity county is worthy of the attention of capital.

Yuba.

RESTRAINING THE DEBRIS PERFECTLY.—*Democrat:* Among the small hydraulic claims compelled to cease operations some years ago was one owned by Steel & Co., at New York flat. This claim is about three miles north of Brownsville, a long distance from the river, and is worked on a small scale using about 300 inches of water and one small hydraulic monitor.

Steel & Co., received a permit to construct restraining works, which they proceeded to do and the work is of the best in the State. When finished the Commissioners approved it as being sufficient and all that the law requires. Since then it has been inspected by Lieutenant Gillett and Engineer Waggoner, assistants of the Commission, also by Mr. Boyd, an agent of the Anti-Debris Association, and each have reported that the dam is restraining the debris and dirt washed from the mine. The water after it leaves the dam is colored very little and when allowed to remain over night in a vessel no sediment is found.

RIVER BED MINING.—The Marysville Gravel Mining Company are making preparations for river bed mining. A large crew of men is employed. There is in place a fifty-horse power under-shot wheel which is intended to drive two large pumps and hoist the gravel from the pit and branch drifts.

NEVADA.

In the Savage, on the 950 level, west crosscut 1, started from the north lateral drift 106 feet north of the station, is advanced 68 feet; face is in clay and porphyry. The south lateral drift from the station is advanced 95 feet; face is in quartz and porphyry. In the east crosscut from the third floor of the old stopes they are extracting some fair-grade ore. On the 1050 level in the west crosscut from the face of the main south drift they continue to stope good ore. They are repairing the main south drift on this level. During the week they have hoisted forty cars of ore; car samples average $42.85 per ton. On the 11th inst. they commenced to ship ore to the Nevada mill and have now shipped 180 tons, aod the mill commenced crushing on the 13th inst.

The bullion statement of the Chollar mine for July is as follows: Worked at Nevada mill, 340 tons; gross proceeds in bullion, $7058.70; cost of reducing, $20.40; net proceeds in bullion, $5018.70; assay value per ton, $30.26; gross average per ton, $20.76; net average per ton, $14.76; mill worked up to 71 per cent.

STOREY COUNTY.

THE BRUNSWICK LODE. — The water-power plan at the Brunswick lode has been abandoned and two steam hoisting works, with engines of sufficient power to work to a depth of 1500 feet, will be built.

ESMERALDA COUNTY.

SILVER STAR.—The Hawthorne *Bulletin* says: The mines are looking better than ever before. The mill is still running on Ed Brown's ore. About a week ago he shipped a $12,000 bar, and he has as much more ready for shipment.

The Oneida is making regular shipments to the Kinkead mill, and the ore goes from $100 to $150 per ton.

The Nelson brothers have about 100 tons of good grade ore on the dump.

The mill at Douglass is not of sufficient capacity to handle one quarter of the output, and many of the mines have large quantities of ore on the dump waiting their turn.

LANDER COUNTY.

The Austin Milling Company, at Austio, has its mill running on a very fair grade of silver ore that, before the slump in metals, might have justified its shipment in native form to the market, but which now issues in the shape of concentrates. Twenty stamps are hammering away at present with plenty of ore in sight.

OREGON.

A SMALL STRIKE.—At Susanville another ledge is discovered in the tunnel being driven on the Cahell mine. The new ore vein is two feet wide and is good looking quartz. The tunnel is now in 600 feet, and it is expected the Cahell ledge will soon be tapped.

ON THE SANTIAM.—The first tunnel at the Santiam mines has been run in forty feet, and free gold ore has been struck. Considerable activity is apparent in the Santiam region, and the hills are being thoroughly prospected for new claims.

GENERAL NOTES.—A carload of quartz shipped from the Tolo Mining Co.'s ledge to Ashland produced $30 to the ton.

Capt. Brown has several samples of ore from the copper mines on Illinois river at his office in Grant's Pass, which assays 27 per cent pure copper and carries several dollars in gold. He is looking for smelting machinery.

Reports of rich gold finds come from the Siletz, and gold-bearing sand is reported found on the beaches near Tillamook. Sluices are being worked and good results reported.

Thirty men are at work on the Josephine County copper mine, some on the tunnel and some on the trail being built from Mudd ranch to Wheeler City. About 250 tons of ore are on the dump waiting the arrival of the

machinery, which will be taken in as soon as the trail is completed.

BAKER COUNTY.

GENERAL NOTES.—The Bonanza mine deal is off; others are trying to secure an option on the property. The owners are working the mine themselves, with monthly dividend.

There is a prospective sale of the Columbia mine on Fruit creek, owned by the Cabell Bros.

The North Pole Company at Cracker creek have started their mill on ore from the North Pole mine. Alexander Baring, one of the principal stockholders in the company, is on the way from London, England.

Times are lively at Bourne, and the E. & E. mines are running with full payroll and good returns.

At Granite a prosperous condition exists and the people are said to be very hopeful. The mines in the vicinity, both quartz and placer, are turning out well and capital is seeking investment there.

The La Bellevue mine is operating with a large payroll.

GRANT COUNTY.

QUARTZBURG MINES.—The formation of this country is granite, syenite and porphyry. There are about sixty claims located, and every location shows from one to three ledges. The veins vary in width from six inches up to eight feet. The value of the ore runs from $12 up to $250 in gold per ton. The oxidized ore extends down to about 100 feet below the surface. Below this depth the ore is more or less base. The value of the base ore is from $8 up to $250 per ton. Development work is being pushed vigorously, according to the means of the different owners.

The richest property in the district is the Present Need group. This property has considerable development work, showing well-defined ore chutes. The average value of the entire ore deposits so far as opened up is all of $100 per ton, all gold.

The Dixie group consists of twelve claims. A mill was started running on the 29th of last month on ore from the Cleveland mine, belonging to this group. This mine shows eight feet of ore in the breast of the tunnel. No cleaning has been made yet. In the Del Delta, belonging to this group, an upraise is being made from the 200-foot level, showing ten inches of ore.

IDAHO.

PAID ALL DEMANDS.—The Idaho Gold Reduction Company of Gibbonsville paid out $70,000 on their pay day last week, settling up in full every claim, says the Salmon City *Recorder*.

A FAMILY PARTY.—A mining party consisting of father and three sons, from St. Paul, Minn., are at Weiser. They have constructed a large boat, upon which they will place mining machinery as soon as it arrives at the depot. The apparatus is of their own invention, and when placed on the boat they will work up and down the river prospecting the bars.

IN THE COEUR D'ALENES.—The Bunker Hill and Sullivan mine and mill at Wardner is working 270 men, about seventy-five short of a full force. The company has all the carmen and shovelers wanted. It is working two shifts in the mine and one in the mill, and Manager Bradley says he expects soon to be working double shifts in the mill also.

Ten men are employed as armed guards. No trouble is anticipated from the union, but it is thought best to be on guard against possible depredations. Five or six men with rifles are kept on the flume, three or four are on guard around the works, and the same number patrol the tramway between the mine and the mill. The company is making regular shipments, and is accumulating ore in its bins. It is the practice of all the mines in the Cœur d'Alenes to work ahead with ore reserves, in order to allow the ore to dry out and avoid paying freight rates on water.

The Last Chance, which resumed operations after the decision in its favor against the Tyler, is working forty men, and running the mill with one shift, expecting soon to have a full force, when it will run double shifts in the mill. The Last Chance is paying the same wages paid by the Bunker Hill and Sullivan—$3 for miners, $2.50 for carmen and shovelers. Since the resumption of work in these two mines considerable development work has been done in various mines around Wardner.

ON CANYON CREEK.—On Canyon creek the Standard is employing 120 men and running two shifts in mine and mill. The new compressor is finished, and the company is about ready to put the drills into the new 3000-foot tunnel. The tunnel is now in about 100 feet, and when completed will be the longest tunnel in the Cœur d'Alenes. The company expects to go into the mountain at the rate of from 150 to 175 feet monthly. The entire distance will be run through country rock, and when the tunnel is completed it will strike the vein 500 feet below the present workings, and about 35 feet above the creek bed.

The Frisco is working twenty to thirty men, and running its mill about one day in the week. It is putting in the largest compressor in the Cœur d'Alenes, with a capacity of forty drills, and will use compressed air for the pumps, the hoist and the drills. The new hoist is on the road.

The Gem is working a full crew of 125 men, with double shifts in mine and mill, and is shipping about 1000 tons of concentrates monthly.

The Granite is being worked under lease, and has recently struck a new ore body which looks well. It is working the mill with one shift.

The Tiger is doing no development work. It is now working eighty men and shipping thirty tons of concentrates daily.

AT MULLAN.—Denis Ryan, of St. Paul, was recently at Mullan and left orders with the superintendent of the Gold Hunter to resume operations as soon as he can get a force of men at the Wardner scale of wages. Men are now coming in and making application for work. With the Hunter working on the basis of $3 and $2.50, it is believed that it will be only a short time till the Morning will resume, and this would give employment to about 300 additional men. The Hunter expects to employ about 100.

The Custer, on Nine Mile, which has lain dormant for the past three years, recently put a small force of men at work, and is being operated under the direction of Campbell & Finch.

OWYHEE COUNTY.

The Poorman was once a great gold producer, but since the time of the paralysis of the district, it had until recently been an uncertain quantity. When Mr. Grotho was put in charge for the London company, systematic development began. The mine already showed sufficiently to warrant the re-building of the mill, which was burned down last year, but it was proposed to put in only five stamps for the present. Developments were such, however, that it was later determined to put in ten stamps. The company is contemplating putting in twenty stamps at once. This is because a new strike has been made in the mine, which seems to justify such an enlargement of the plan of operations, as it shows a large body of good ore, and proves to the satisfaction of the management that the vein is strong and permanent.

BRITISH COLUMBIA.

ON THE ATHABASCA.—There are over 500 men mining on the bars at the mouth of the Pembina river, a branch of Athabasca river, making from $2 to $4 per day each. As soon as the water gets low enough they will move to old Fort Assiniboine on the Athabasca, where much richer diggings are known to exist.

THE SMELTING BOUNTY ACT.—The following is the smelting bounty act as passed at the late session of the Canadian Parliament at Ottawa:

1. To encourage silver-lead smelting and the smelting of other ores of silver and gold in Canada the governor in council may, subject to the following provisions, authorize the payment of a bounty not exceeding fifty cents per ton, and not exceeding in all one hundred and fifty thousand dollars, on Canadian silver-lead ore and other ores of silver and gold smelted in Canada between the first day of July, one thousand eight hundred and ninety-five, and the first day of July, one thousand nine hundred.

2. The said bounty shall not for any one year exceed the sum of thirty thousand dollars: Provided, that the said sum is unexpended, or any balance thereof unexpended may be carried forward from year to year and may be paid for any year in addition to the sum of thirty thousand dollars authorized as above for such year.

3. If in any year the quantity of ore smelted is greater than will allow of the payment, out of the sum available for that year, of fifty cents per ton, then the bounty for that year shall be reduced proportionately.

4. The said bounty shall not be paid on any ores smelted in smelting works which are not established and in operation before the first day of January, one thousand eight hundred and ninety-seven.

5. The payment of the said bounty shall be under the direction of the minister of trade and commerce, subject to such regulations as are made by the governor in council.

6. The governor in council may make regulations in relation to the said bounty in order to prevent fraud and to insure the good effect of this act.

7. The said regulations shall be laid before parliament within the first fifteen days of each session, with a statement of the money expended in payment of the said bounty, and of the persons to whom they were paid, and of the places where the ore with respect to which they were paid was smelted, and such other particulars as tend to show the effect of the said bounty.

ALASKA.

GENERAL NOTES.—Willis Thorpe purchased the Takou Consolidated group of mines for $75,000 at sheriff's sale. This group is considered among the best annual producers of Silver Bow basin.

Ex-Governor Swineford has commenced work upon the Lucky Chance and the Turner property is soon to be developed. There are indications of nickle in the Millmore vein.

In the neighborhood of Loring, placer diggings have been found on the Stewart river.

MONTANA.

THE JAY GOULD BONDED.—The Jay Gould mine, which has produced in three years $1,400,000, has been leased with a bond to purchase to G. B. Hoit and B. Geraldine of Chicago. The mine was examined and recommended by A. D. Churchill. It is expected that when opened and worked on the extended plan proposed the mine will largely add to the gold output of the State.

UTAH.

ANOTHER MERCUR DIVIDEND.—*Tribune*: The Board of Directors of the Mercur Gold Mining and Milling Company have declared another dividend of $25,000, or 12½ cents a share, payable Aug. 20th. This is the twelfth dividend that will have been distributed by that great gold producer, with a total of $300,000.

THE HORN SILVER.—Horn Silver has increased its payroll to 200 miners, and on the 20th will distribute about $20,000 among them. The mine that sold for $5,000,000 has paid dividends to date in the sum of $5,147,500.

COLORADO.

MISSED A GOOD OPPORTUNITY.—The Home Run property at Cripple Creek, for which there is now a standing offer of $100,000, was offered for sale for sixty days following last 25th of December for $1100. An option upon the property at that price was given to Guyot, Mullen, Griffith and Brainard, who were looking for a cheap patented claim in the Cripple Creek district to put in a mining company which was being incorporated by Eastern incorporators, who refused to pay the $1100.

TELLURIDE MINE SOLD.—The Japan mine, of the Telluride district, is sold for $125,000 to David Swickhimer and A. J. Clarke. The property embraces four claims, and has been operated at a profit for fifteen or twenty years. It is estimated that there is now blocked out in the mine $170,000 to $180,000 not profit. The mine has been paying $3000 a month during the development, and it is estimated at the present price of silver that it can be made to pay a profit of $6000 to $10,000 a month by the addition of a mill to concentrate large bodies of low-grade ore that have accumulated on the dump.

NEW MEXICO.

REPORTED A FAILURE.—The mill recently built at Bland, to treat Cochiti ores, is reported to be a failure. Cochiti ores are silicious, arsenical pyrites carrying a trace of tellurium; and about sixty per cent. silver and forty per cent gold. By raw pan amalgamation about sixty per cent of the value can be saved. Roasting and pan amalgamation will save ninety per cent. The shipping ore, which averages over 100 per ton, will average about ninty per cent silica.

ARIZONA.

PROSPERITY AT BISBEE.—At the Bisbee mine the daily product is $6,000. They ship 700 tons of copper bullion per month; they have 100 men working in the reduction works and 300 or more in the mine; they are running four large smelters and are arranging to put on more men and have in course of construction a smoke concentrator 12,000 feet long, and eight feet in diameter. This will carry to an elevation above the town the smoke and sulphurous fumes.

OLD PRODUCERS AND NEW DISCOVERIES.—*Journal-Miner:* The Mescal Milling Company has completed a run of 130 tons of ore from the Jersey Lily mine, and the Senator mill has run 100 tons from the same mine. The ore is expected to give a return of from $25 to $35 in bullion, while about a carload of concentrates has been obtained from the two lots. The concentrates are worth $90 per ton.

Holtzschue, Clark and Coy have sold the Planet and Saturn mines in Fool's gulch to Boston capitalists. These claims are located three miles from Congress station, and a mile from the Yarnell mine. They have about 350 feet of development work done on them and rich ore has been taken from them. The purchase price is said to be $60,000.

General Churchill, who recently returned from a tour through the mining regions, says: "About eighty miles south of Prescott there is a vast and rich mining region covered by hundreds of claims whose locations date back from one to thirty years. There has been almost no development, the locators having labored under the misapprehension that the claims could be sold as mines. This had formerly been done, but late purchasers have been unwilling to risk investments upon such surface indications. In many instances the locators were unable to go on with the development, and so during all these years they have been performing annually the $100 worth of work required by law. No attempt was made to procure the co-operation of capitalists and this rich district has therefore been permitted to lie practically idle. Now miners are taking a different view of the case and good prospects are being developed so that their real worth may be set before prospective purchasers."

T. P. Carson, superintendent of the Reymert group of mines in Pinal county, has for four months been working the Mountain Chief mine in Humbug District, on a six months' bond, and will commence the erection of a twenty-stamp mill for the reduction of its ores, settling the question of the purchase of the property. He has bought for his company the Farley & Kay group of twenty-seven claims near the Mountain Chief. A large force is at once to be put to work on the different claims to see what lies below the grass roots and much activity is promised for the district, which lies just north of the Yavapai county line, sixty miles south of Prescott, and not far from the Castle creek hot springs. The Farley & Kay group, on the authority of J. W. Yocum, is the best aggregation of undeveloped claims in the county of Yavapai, lying immediately within a cluster of fully a hundred well-mineralized claims. Upon the group are many ledges of highly mineralized ore, running high in sulphuretic gold and silver, though little underground work has been done upon them. Mr. Yocum is managing the affairs of the Columbia Mining Company in the district. His company, composed mainly of Kansas City capitalists, is furnishing funds for the development of several promising claims, exploration running 200 feet in depth. The ore is both free milling and concentrating.

TWO RUNS OF ORE.—*Journal-Miner:* The Mescal Milling Company has completed a run of 130 tons of ore from the Jersey Lily mine, and the Senator mill has run 100 tons from the same mine. The ore is expected to give a return of from $25 to $35 in bullion, while about a carload of concentrates has been obtained from the two lots. The concentrates are worth $90 per ton.

MEXICO.

A MINING CASE DECIDED.—An interesting mining case has just been decided at Nonclovia. Creditors of the Punuca Mining Company, living in New York, brought suit for possession of the property to cover a debt of $50,000 due them by the company. After a trial the Court rendered a decision in favor of the creditors, and they have been placed in possession of the mine, which is valued at $300,000.

A BONANZA.—The mine of the Mezquital Mining Company, south of Tepic, is in bonanza. The vein of gold in this mine is producing ore to the value of $25,000 per day.

Coast Industrial Notes.

—Oakland talks of subscribing the required bonus to secure the establishment there of the Ostrauder gun works.

—The California Prospecting and Development Co. has organized to bring the Beal Prospecting Coal drill into general use in sampling mining claims.

—Destructive forest fires have raged in western Washington since the 1st inst. Five saw mills near Tacoma were burned this week, and hundreds of thousands of acres of valuable timber land burned over.

—Henry T. Scott, president, has selected George E. Dow and L. R. Mead to act with him in arranging the details for the incorporation of the Manufacturers' and Producers' Association which now has about 1100 members.

—The hop growers on the American river have organized for mutual profit and protection. The price of hops is so low that it will hardly pay this season to gather them, and some growers have decided to let the hops rot in their yards.

—The Producers' and Consumers' Oil Company has organized at Fresno, Cal., to develop the petroleum district in the Coast Range mountains near Coalinga. The stock is subscribed by Fresno and Ohio men. The capitalization is $1,000,000, of which $100,000 has been subscribed.

—Luscious fruit and melons pitched into the bay here, for want of purchasers, while selling through the city at good prices, indicates to the producer the need of a better system of local distribution. At present the producer and consumer are "cinched" to swell the profits of the middleman.

—The Clear Lake Electric Company has a project to convert the waste water power of Clear Lake, in Lake county, and Cache creek into electrical power, to be used at points between there and this city, inclusive. Clear Lake is 1317 feet above the sea, and the water power to be derived from that source is considerable.

—Among the passengers on the steamer China last Tuesday was Irving M. Scott, of the Union Iron Works, who is of the opinion that San Francisco can and ought to build the new battle ships that Japan talks of getting. He took a model of the Olympia with him, and shortly after he gets to the island kingdom the Olympia herself will be there.

—Crude petroleum is to be used for fuel in the locomotives on the local Oakland and Alemeda trains. The oil costs twenty-five cents per barrel in Los Angeles, and the S. P. people figure they can lay it down on the bay at fifty cents per barrel. It is estimated that, as compared with coal at $4.50 per ton, a saving of twenty-five per cent can be effected.

—Fresno raisin growers and commission packers are advertising to buy raisins for cash and are offering two cents a pound in the sweat box. The commission dealers have difficulty getting contracts from the growers this year, and with some of them it has become necessary to offer cash or go without raisins to make their pack. The price offered is about cost of production.

—The damage done by the fire on the Austin tract near South Bay, Wash., is estimated at 5,000,000 feet of cedar and 30,000,000 of fir. For three-quarters of a mile from the lake the forest is perfectly clear of underbrush and all debris. It is thought that 150,000,000 feet of fir has been so burned as to necessitate logging within two years. At present prices this would amount to a forced marketing of timber worth on Bellingham bay $150,000.

—President J. B. Stetson and General Freight Agent W. L. Russell, of the North Pacific Coast Railroad Company, ask the State Board of Equalization that their company's assessment be reduced from $650,000 to $600,000, the same as it was last year. They complain that the business of the road has fallen off because the dairy and lumber business had dropped all along the line. The matter was taken under advisement.

—The Canadian Pacific is planning to build to Trail creek mining district—not a branch line or a "stub" road, but a direct branch from Revelstoke, giving all rail connection not only with Trail district but with the Slocan and Nelson mines. Fifteen Canadian Pacific surveyors, headed by competent engineers and fully equipped with all desirable instruments for rapid work, are now engaged near the foot of Lake Slocan in making observations and measurements and selecting a practical railway route.

—The superintendent of the Union Pacific motive department says: "Out of a total equipment on the Union Pacific system of 25,000 freight cars, 10,000 are equipped with air. All of the locomotives are equipped with air brakes and about 400 are supplied with the driver brake. As fast as the engines go through the shops at the present time they are being supplied with the driver brake, and by January 1, 1898, all the Union Pacific engines will be supplied with the driver brake according to law."

—Eastern men are at work on the old project to reclaim the Colorado desert by turning the waters of the Colorado river over that vast territory. As outlined, the plan comprehends the development of the greatest irrigation system in the western hemisphere. As an indication of the good faith of the promoters, they are said to have handed the Southern Pacific Company a check for $1,500,000 in return for its title to the alternate sections of land in the Salton basin, amounting to about 600,000 acres. The irrigation of so vast a tract of land would revolutionize the fruit industry of the country. The company say they expect to have 300,000 farmers on their lands within a few years.

Scientific Progress.

Records an Earthquake.

It is now possible to discover an earthquake and to mark its force at a distance of several thousand miles. A recent earthquake in Algeria was made known to scientists in Paris while it was actually taking place by the undulations of certain delicate instruments over a strip of paper. That the movements of the earth could thus transmit themselves almost instantaneously, registering, as it were, across the Mediterranean and nearly the whole of France more quickly than a telegraph message could have been sent, seems hardly plausible. But there is a subsequent more marvelous demonstration of the self-registering of an earthquake much farther away. Within an hour from the time it commenced the late earthquake in Japan had revealed itself to the instruments of the Roman college. The oscillations of the earth outlined themselves on a single sheet of paper clearly and distinctly, showing plainly that there were five separate "disturbances" of varying force. Recent scientific reports that have just come from the Japanese empire confirm the accuracy of the instruments of the Roman college in a most remarkable manner. The practical part of the discovery is that the approach of an earthquake may be told with little chance of error, though it must be confessed that the instruments give no hint of direction, nor do they indicate the starting point.

Instruments of this character were at Nicolaieff and Charkow, cities in the central part of Russia, and here the Japanese earthquake mentioned was registered even more plainly, the distance in this case being fully 4500 miles. The instruments in these towns were carefully watched at this time, and they were seen to oscillate and mark the tremblings of the earth for over an hour.

One of the most remarkable of modern inventions, indeed, is this seismograph, which was invented by Bertell. The most valuable evidence of its practical benefit to mankind was in 1883, when the sensitive machine gave warnings of an eruption of Mount Etna. Up to this time, however, it has only been valuable for foretelling shocks comparatively near at hand. The long-distance instances recorded above are the first in the history of the seismograph.

THE necessity for a patent court, whereby litigation arising out of the grant of patents may be speedily and inexpensively settled, is becoming more and more obvious every day. The subject of a patent court is not a new one, as it has been agitated for a number of years, and many bills have been introduced in Congress to establish the same, but have failed of success. The present courts having jurisdiction to try patent causes are overcrowded with other work, so that parties in litigation are subjected to vexatious and annoying delays, as well as to unnecessary pecuniary expense. The patent court should be composed of eminent patent lawyers and should have no jurisdiction over other questions. The members should also be allowed sufficient pay to induce competent persons to accept the positions. It should also be a court of last resort, thus avoiding the great delays incident to appeals. This court should also have jurisdiction of interference causes in the Patent Office, which would relieve the latter of a great deal of its work. It is to be hoped that the coming Congress will see fit to pass one of the many bills heretofore introduced relating to the subject.

AS THE RESULT of nearly 40,000 tests of timber made at the laboratory of the Washington University, St. Louis, the following facts have been determined: Seasoned timber is about twice as strong as green timber, but well-seasoned timber loses its strength with the absorption of moisture; knots are as great a source of weakness in a column as in a beam; long-leafed pine is stronger than the average oak, and bleeding timber does not impair its qualities.

GESNER'S method of protecting iron and steel against rust consists in forming on the surface of the metal a double carbide of hydrogen and iron, which is extremely hard and adherent. In fact, a bar thus coated can be bent through an angle of 45° without disturbing the layer. In carrying out the process the articles are thoroughly cleaned from rust, but it is not indispensable to remove all oil or grease. A couple of gas retorts are placed alongside each other and raised to a temperature of from 600° to 700° C. The articles to be treated are then placed in these retorts for about twenty minutes, after which a current of hydrogen is passed through the retorts for forty-five minutes. A small quantity of naphtha is then introduced, the supply being maintained for ten minutes. It is then stopped, the current of hydrogen being kept up fifteen minutes longer, when it is stopped and the retorts allowed to cool to 400° C., and when this temperature is reached the doors can be opened and the finished product removed. The coating thus given has a bluish color.

M. MOISSAN has recently succeeded in preparing large masses of pure molybdenum. This metal thus obtained has a specific gravity of 9, and is only fused with difficulty. The pure metal is quite as soft and as malleable as wrought iron, and can be easily forged at a red heat. It can be preserved without oxidation under water for several days. The most remarkable property of the metal is, however, the fact that it can be cemented like wrought iron, forming a "steel," if the term may be used, which can be tempered similarly to iron steel. Moreover, cast molybdenum containing several per cent of carbon can be softened by placing it in a mass of oxide of the metal, just as in the ordinary process of making malleable castings. Having a very great affinity for oxygen, M. Moissan suggests that it may be usefully added to the iron in a converter, replacing manganese or aluminum. As the oxide of the metal is volatile, it does not remain in the converter.

BARON NORDENSKJOLD has shown practically that water can be found by boring into granite and other crystalline rocks to a depth of from 100 to 170 feet. His theory was that the variations in temperature ought to cause shearing strains between the upper and lower layers of the rock, which would make horizontal crevices into which water from the surface would percolate, and that the water would be fresh. A well was sunk in the islet of Arko, off the Swedish coast, in 1894, and at 110 feet fresh water was found, supplying 4400 gallons a day. Since then six other wells have been bored and water found at about the same depth. The object of the search was to provide lighthouses and pilot stations with a permanent and plentiful supply of water.

CELLULOSE, a porous preparation prepared from cocoanut fiber, has been found exceedingly useful in stopping leaks in ships. A plug of it is thrust loosely into a large hole and soon swells with moisture until it fits snugly The idea originated abroad, but an American has discovered that cellulose can be made out of the pith of cornstalks. The naval authorities have tested this latter variety of the product and find it efficacious.

IT is asserted that smoke never does issue from a volcano. Nor does fire. The red light seen above the crater is not flame. It is the glow of molten lava reflected on the under side of the clouds of dust. And the clouds of dust are never mixed with smoke. There are bursts of steam sometimes, but rocks do not burn as wood does and give off the finely divided carbon dust that we know as smoke.

Mechanical Progress.

Electric vs. Hydraulic Elevators.

The economical operation of an electric elevator plant, as compared with a hydraulic elevator outfit, becomes principally a question of the efficiency of the generating plant. Ordinarily the efficiency of a drum-winding electric elevator, from the electrical energy at the motor terminals to the work done by the lifting cables, is from fifty to sixty per cent.

The efficiency is about the same as that of the hydraulic machine. As the steam-generating apparatus in both cases may be the same, it becomes a question between using steam in a pump cylinder to produce hydraulic energy at the other end, or using it in a modern high-class engine cylinder to produce electrical energy at the dynamo terminals. Generally considered, it would seem that the latter had the advantage, but the writer has been informed by a prominent hydraulic engineer that a hydraulic installation of the best design can equal an electric plant.

Even though this be a fact, and both installations have the same efficiency, from the coal consumed to the work done by the elevator car, the collateral advantages alone of the electric outfit would warrant its installation. In assuming, however, that the two are equally efficient, we are considering that both work with loaded cars. Whether loaded or empty, it matters very little in the hydraulic machine, as the cylinder always takes the same amount of water, although in some machines the cylinder is arranged to use either all or one-half of the full amount. The actual average efficiency of the hydraulic machine would, therefore, compare very poorly with that of the electric plant, in which the motor consumes energy only in proportion to the work required. The hydraulic machine, it is true, takes water power only one way, yet this is always sufficient to meet maximum requirements.—Joseph Sachs, in Cassier's Magazine for August.

A New Telegraphic System.

In a telegraphic device, based on vision synchronism, the alphabet is reduced to eight characters, which are straight lines from which letters are formed. It is claimed that 200 words a minute can be sent, and that as much work can be done with one line under this system as with ten under the Morse. A message is first written on a typewriter connected electrically with a punching apparatus. Through the punching apparatus runs a strip of paper an inch wide. As the letters are struck on the typewriter a series of holes are punched in the paper, the holes running in straight lines across it. Each hole, or series of holes, represents a letter. For instance, I is represented by one hole, because it takes but one of the elementary characters to make it. B, which is made by six of the elementary characters, the largest number required for any one letter, is represented on the ribbon by six holes. When a letter is finished the strip is also finished, and the strip is then put into the transmitting apparatus and runs over a small metal roller, above which is a series of small metallic fingers which press upon the strip. As the different holes in the strip of paper pass under the fingers electrical connection is made with the roller and the characters represented by the holes are struck at the other end of the line.

A DISPUTE about the two new battleships authorized for the current year has just been settled by the Naval Board of Construction. Chief Engineer Melville contended that an allowance of 1200 tons weight for the machinery was necessary to give the ship 11,000-horse power and the required speed of sixteen nots an hour. The board compromised on 1100 tons, ensuring 10,500-horse power. Secretary Herbert will have to pass upon the recommendation of the board. He has already approved the view of the majority that the new gunboats should have double-decked or two-story turrets, armed by 13-inch and 8-inch guns.

A DEVICE for stopping an engine from various parts of a mill, or from the engine room, in case of running away, by means of electricity, is being used. The pressure of the electric button energizes a magnet, which detaches a releasing gear, and a weight instantly throws the governor balls to their highest position, and presumably prevents the engine from taking steam. Where this has been tried it has proved successful so far. Yet, so far as being a safety device is concerned, its only advantage over the common governor is in the ability to shut it from various parts of the mill. The device lifts the governor balls to their highest position, but whether or not this does the work of shutting down the engine will depend upon whether the valves are set properly with relation to the governor, and if they are the governor will prevent racing without the use of this device as well as with it. The misadjustment of the valve gear or the changing of the length of the governor rods will make this safety stop of non-effect, for though it raises the governor to its highest position the setting may not remain such that in such position no steam will be admitted to the cylinder of the engine. The object of an automatic stop motion, as the *Scientific Machinist* understands it, is to act as two safety valves would act, one to be a distinct check upon the other. Any device that depends upon the governor depends upon something that is extremely liable to get out of order, either through accident or neglect. If the practice was common to keep these governors so they would control the engine when in their highest position, no other safety device would be needed, so far as the governor is concerned. The trouble is that these governors are continually being misadjusted, and the engineer who will permit such a condition of affairs at all will do so with a safety attachment upon the engine just as quickly. Such a device, therefore, is not a check upon the governor, but merely an adjunct to it, depending for its success upon the action of the uncertain governor itself.

THE new navy rifle, the invention of J. P. Lee, of Connecticut, has been recommended by the Small Arms Board after many experiments. By many this gun is believed to be superior to the Krag-Jorgensen rifle now used in the army. The navy rifle is lighter, thus enabling the sailor to carry fifty more rounds of ammunition than the soldier, and gives a flatter trajectory. The rapidity of fire is very great, five aimed shots being fired in three seconds. The total weight, with straps, is 8½ pounds, which enables the sailor to carry 200 rounds of ammunition. The barrel is twenty-seven inches long, the trigger is at all times under control, and there is no danger of accidental fire, while the magazine clip is the lightest in use. The fire is very accurate at 2000 yards, while at 5000 the bullet would pierce two or three men in a row. It would penetrate the body of a man at a distance of 6000 yards. The barrel is made of nickel steel. The results of the tests have been so satisfactory that it is thought the National Guard in some States will adopt it.

THE wire nail, made of steel or iron, is pronounced a failure as a shingle nail. The life of the wire nail when used for shingling is said by experts to be not more than six or seven years, and the length of time ranges from that down to five, four and even less in sections where large amounts of soft coal are burned, or from other local causes. The results from the nail being used where there is exposure to the sea air are even more disastrous, and in many places along the coast the steel nail has given place to the nail of copper or the galvanized nail. Even the old cut nail will last much longer in such exposed positions than the wire nail of steel or iron.

Electrical Progress.

A New Electric Railway System.

A newly invented street railway system solves the electrical propulsion problem by doing away with the trolley. It is easily built, and there is said to be no limit to its power. It is particularly adapted to city uses and for elevated roads, and is the property of a Pittsburg company. Its chief novelty is the manner in which the current is picked up. The car motor, instead of being fed from a continuous overhead wire through a revolving trolley wheel, receives its current from three metallic slats which extend underneath the whole length of the car. Every twenty feet three metallic knobs come to the surface of the pavement, and are so placed that each of the slats makes contact with one of them. There is no current whatever in these knobs until they come in contact with the three long conductors beneath the car. This result is accomplished by an automatic switch. One of the knobs receives from a small storage battery in the car a current of sufficient strength to attract an electromagnet to its keeper and thus complete the circuit for the main current. After operating the motor the main current passes back to the power house through another slat and its corresponding knob. In order that there may be no break in the supply of electricity, the set of knobs are placed a less distance apart than the length of the car. Before contact with one set has been broken, contact with another set has been made. As soon as the slats have ceased to touch a set of knobs the attraction in the electric magnet stops, and the knobs become pieces of ordinary iron again. There is thus no danger for horses or vehicles, as nothing but electricity passing through a knob can revive its hidden force. As the system does not contemplate the use of an underground trolley, it can be adapted to street railway tracks without any necessity of rebuilding the road.

Edison's Minor Inventions.

It is not the electric lights nor the phonographs, nor any of the other things with which Mr. Edison's name is connected, that strikes the visitor as the greatest part of his work. It is the invention of the innumerable machines with which these things are made. The idea of the electric light would have been of no use in the world without machines for making lamps and the other parts. All of these machines had to be invented and made by the electricians, and there are thousands of them—some no bigger than a toy engine, some as large, nearly, as a house. Many of them are so delicate that they are operated with a belt no larger than a shoestring. One of them is used for polishing jewels for use in the phonographs. Without being touched by anybody it holds the tiny jewel in every possible position, shifting it, turning it, absolutely feeling it, to learn whether it is smooth, and all the while its delicate fingers are at work rubbing, rubbing at the jewel, which is no bigger than the head of a large pin. No boy could move his fingers more dextrously than this machine moves its parts in turning the jewel around.

A Pittsburg dispatch reports that one of the lost arts has again been discovered, and three employes of the Carnegie Company, iron and steel workers, have discovered the art of welding copper to iron or steel. They show several samples of the metal perfectly welded. The last record history gives of these metals having been welded was in 500 B. C. The value of the discovery comes in the fact that copper offers greater resistance to the action of salt water than any other metal. The Carnegie Company has offered the men a fixed price for the secret. A shop has been fitted up for the men at the Homestead plant, where the men propose to weld a plate of copper to an ingot of nickel-steel armor plate. The Carnegie Company hopes to be able to cover all armor plates for big battle ships.

Three years ago there was a great deal of talk of an electric road between Chicago and St. Louis, making the 250 miles in two hours and a half or less. Practical railroad men at the time placed little confidence in the scheme, claiming that its projectors were trying to attain the perfection of electrical railroading at one bound and without the necessary intermediate experiments. Time has shown their judgment to be true. Railroad men agree that the use of electricity will not become general on the trunk lines until an absolutely certain system of underground contact has been worked out. The overhead wires they claim will never do for the great roads. It is possible in even temperatures like California, but no conduit has yet been designed which will withstand the adverse conditions of climate in the Eastern States.

The elimination of the element of danger of life and limb in the running of trolley cars has, it appears, engaged the attention of the electric railroad companies across the water more than it has in this country, where human life appears to be held so cheap. The report of the principal electric tramway company of Berlin, Germany, shows that in 1893 there was only one personal accident on its lines per 41,625 car miles run. The comparative safety of the German trolley lines, however, is not confined to Berlin. Other cities make an equally satisfactory showing, and in Halle there was in 1893 only one person injured upon a running of 88,640 car miles. Much of the credit of these figures, it is claimed, belongs to the excellence of the controlling devices with which the motor cars are equipped.

An electrical plant for the manufacture of phosphorus has been established at Grand Crossing, Chicago. It is now a modest affair, but it is the result of a number of years of experimenting, and the promoters say the method of manufacture they have discovered is so cheap they will be able to control the phosphorus market. At present there are but three active phosphorus plants in the world, one in the United States and two in Europe. The Chicago company will make the fourth. The annual output of phosphorus is estimated at 50,000,000 pounds. At an average wholesale price of 50 cents per pound, the value of the product will reach $25,000,000.

According to Charles Booth, in his latest work on the "Life and Labor of the People of London," the great majority of men employed in all branches of electrical work in London are under 25 years of age. It is also stated that of some 5000 men engaged in different electric works, only 13 per cent are members of a trade union. It has often been noted in this country that nearly all practical electricians are young men.

Calecoli's type-setting machine, actuated by electricity, is described by *L'Illustration*, of Paris, as likely to work a revolution in printing. Its capacity, when manipulated by an experienced operator, is said to be 50,000 ems an hour, which is several times the speed of any present machine.

The Mutual Electric Light Co. will soon have its plant in operation and will enter into immediate competition with the Edison Light and Power Co. Indications are lower prices and, after awhile, a "business understanding," and an adjustment mutually satisfactory.

The Southern Pacific Co. has about determined to equip all of its passenger trains with electric headlights.

Practical Information.

Russia's Mineral Development.

Consul Morris furnishes advance sheets of a consular report from which it is learned that the production of pig iron in 1881 amounted to 492,950 tons, and in 1893 to 1,278,350 tons. This industry has especially developed in southern Russia, where the works, situated near the rich mineral deposits of Krivorog, are abundantly supplied with combustible material. The manufacture of iron has increased from 323,200 tons in 1880 to 543,500 tons in 1893. In the same period the production of steel has increased from 338,650 tons to 538,050 tons. The quantity of rails produced has only slightly increased, in all only 28,900 tons, but this essential difference is to be noted, viz.: Of the 220,300 tons manufactured in 1880, 184,650 tons were made from imported pig iron, the remainder being produced by Russian establishments from Russian raw material. The production of manganese was commenced in Russia only two years before the commencement of the last reign. In 1880 the total quantity extracted amounted to 10,850 tons; in 1893 it reached 274,450 tons. Owing to the employment of this mineral in the manufacture of steel, the demand for manganese has rapidly progressed, and the mineral of the Caucasus has opened for itself rich markets. The extraction of mercury had its beginning in Russia scarcely ten years ago, but at present the country is not only able to dispense with foreign mercury, but since 1889 considerable quantities have been exported. The production of coal, which was 3,627,450 tons in 1880, amounted to 8,309,350 tons in 1893. The salt produced in 1893 amounted to 1,598,950 tons, against 857,650 tons in 1880. The naphtha industry has had a colossal development. The construction of the necessary railroads and other appropriate measures have enabled the Russian supply not only to furnish that country with petroleum and grease, but also to organize a vast export trade to all parts of the world. In 1880 the amount of naphtha extracted was 386,400 tons; in 1893 it amounted to 6,084,850 tons. Coincident with the increasing production, the importation of naphtha and its products decreased from 21,667 tons in 1880 to 361 tons in 1893, while the exportations increased from 4460 tons to 1,070,721 tons.

Seasoned Lumber.

There is no difference between "seasoned" lumber and "dried" lumber. "Thoroughly seasoned" or "thoroughly dried" lumber is lumber which has been dried, either in the open air or in a dry kiln, until it has reached that state of dryness which is relatively permanent. It then contains water equal to about ten per cent of its weight. This is what might be called the atmospheric moisture. This will remain in the wood unless driven off by evaporation at a temperature of 212° Fahrenheit or more. The word "thoroughly", when used in this connection, means "uniformly" as well as "effectually." That is, "thoroughly dried" lumber is dried uniformly throughout its entire cross-section and throughout its entire length.

To determine the percentage of moisture of lumber it is only necessary to cut a section from a board or stick and weigh it; then dry in an ordinary stove oven with a slow fire for an hour or two and then weigh again; the difference in weight divided by the dry weight is the percentage of moisture. As determined by this test, "thoroughly dry lumber" should not contain more than ten or twelve per cent of water, and the interior should be as dry as the exterior.

The necessity for using thoroughly dried lumber where shrinkage is to be avoided, arises from the fact that below about thirty per cent moisture lumber shrinks nearly as much as it dries. That is to say, when lumber dries down from thirty per cent moisture to ten per cent moisture it dries out, or loses in weight, twenty per cent of its dry weight. It also loses about twenty per cent of its dry volume, or say fifteen per cent of its volume at thirty per cent moisture. The shrinkage lengthwise is very slight.

A consular report tells of large quantities of shelled eggs being sent to England from Russia and Italy for the use of pastry cooks, bakers, hotels and restaurants. The eggs are emptied from their shells into tin cans holding a thousand or more, and after being hermetically sealed are packed with straw into wooden cases, the taps through which the contents are drawn being added by those using them. Great care is necessary in selecting the eggs, as a single bad one would spoil the whole lot. Lower price and saving of time and greater ease and less expense and loss in handling are named as the advantages of this system. Thus far the Russian product has been uniformly good, whereas the Italian shipments have so frequently been spoiled that analysis of the Russian supply has been ordered to determine if preservatives are used.

Intelligible heliographic signals have been exchanged between Denver and Long's Peak, a distance of seventy miles. The signal corps went on to Pike's Peak, to try it from there. Long-distance signaling is no new thing to plainsmen. For ages the Indians have had a way of conveying intelligence by means of smoke. They make a fire of green boughs, cover it with a blanket, and by lifting the cover at proper intervals and letting out puffs of smoke, they convey information that is understood miles away. The aboriginal telegraph was somewhat on the principle of Morse's original system; the puffs might be long or short, and the column of smoke large or small, according to the urgency of the action advised by the distant correspondent.

It appears very strange sometimes how rapidly an upright boiler will be externally corroded along the grate line, and particularly when the engineer asserts that ashes are never allowed to accumulate. The average engineer, however, does not carefully clean out between the edges of the grate bars and the shell, however careful he may clean the grate. Some engineers have a practice of banking with wet coal that may assist in this corrosion, particularly if the coal is soft and has some sulphur in its composition. In very many ways the ashes may become damp when laying off over night or Sunday, and is held against the shell and soon eats its way through.

The final report of the executive committee of awards of the World's Columbian Exposition has just been published. The total number of medals awarded was 23,586, of which number foreign countries received 13,740, and the United States 9846. Foreign countries captured 14,366 diplomas, while the United States secured 10,622, making a total of 24,988 diplomas. Foreign honors went to Germany, the representatives of that country winning 2518 medals and 2649 diplomas. Japan was second with 1581 medals and 1598 diplomas.

High speed engines, as a class, are often condemned for irregularity of running and rapid wear when the fault is not in the type but in the attention given the machine itself. It stands to reason that a short-stroke engine, running at a high velocity, requires more oversight than one which makes the same piston speed with one-fourth the number of revolutions, but this fact is not always taken into account by owners, who think that an engine is an engine and that all of them will run economically under the same conditions.

There is a growing belief that the shallower parts of the eastern Atlantic are portions of a submerged continent that once joined the American mainland.

Professional Cards.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 15, 1895.

Interest, except in the political world, is transferred from silver, which about holds its own, to copper, which has advanced 30 per cent in value in a comparatively short time.

Copper is the electrician's metal, and every electric railway and electric-lighting plant have to depend upon copper to supply them with the necessary facilities to carry on operations. These enterprises are multiplying so rapidly all over that it is safe to predict they will create a new and most significant demand for copper wire. Old systems are being extended, and new electric railways are being projected right and left. The demand for electric roads is spreading not only throughout this country, but in Europe also, and it has even extended to Rome, where application has been made to construct and operate an electric railway in that city.

London is to build a new underground electric railway to cost £3,000,000. Leading authorities engaged in the manufacture of copper wire state that feeder cables of pure copper are now made as heavy as 3⅜ pounds to the foot, or 19,800 pounds to the mile. These large cables are made of bare stranded copper of 49 and 61 strands each, and are used on account of their greater conductivity.

As an applied science electricity is advancing, and the revolution in motive power which it will create must prove of immense significance and benefit to the whole copper industry. The electrical demand in itself will yet electrify the copper market, otherwise it would have to be demagnetized to escape its influence.

A new York treasurer of a local copper mine says that thirteen or fourteen cent copper would not surprise him. He figures that the copper market is back to the position where it was when the Anaconda and Boston & Montana came into the field as producers and broke the market to the lowest prices ever seen, and created the enormous export business which has been witnessed the last few years; whereas formerly copper was three to five cents higher here than abroad. Now he finds that the consumption of copper has expanded until it is able to absorb the output of all the present producing mines in the country; in fact, he figures that our consumption is now for the first time in years ahead of our production.

The last Calumet & Hecla report gives the output of mineral equivalent in round figures to 80,000,000 pounds of refined copper; of which 60,000,000 pounds were smelted and the balance stored.

With this 20,000,000 stored and the same output this year as last the company will have for sale 100,000,000 pounds of refined copper. The cost is probably six cents or under. The profit on 100,000,000 pounds at the present price of copper would be $6,000,000, or $60 per share. Last year dividends of $15 per share were paid, and the lowest price of the stock was $250, at which price it netted six per cent.

Pig lead continues strong. There have been further advances of $9 per ton from the low point in March. White lead has advanced $5 per ton.

Mining Share Market.

SAN FRANCISCO, August 15, 1895.

There was an advance during the week that was maintained throughout; the week was a busy one for the brokers. Prominent controllers of Comstock mines are here in consultation, and not in many years has the street seen John W. Mackay, Senator J. P. Jones, Alvinza Hayward, and Superintendents Lyman, Kervin, Keating and Sharon in consultation. The first two mentioned say they are simply here "for a little rest." Mr. Mackay says he will remain two or three months and visit the Comstock while "resting" himself.

Hale & Norcross has improved in price since the decision and the mine prospects have also improved.

To encourage business the Pacific Stock Exchange has done away with its tickets of admission. A resolution has been introduced in the big board to allow outsiders to go on the floor during the informal session upon the payment of a small monthly fee.

The Con. Cal. & Va. directors will investigate the matter of Supt. Lyman's alleged stock manipulations this Saturday morning.

The following illustrates the changes of the week:

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of June, 1895, an assessment (No. 19) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of July, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 21st day of August, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, Room No. 69, Nevada Block, No. 309 Montgomery Street, San Francisco, California.

KENTUCK CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of August, 1895, an assessment (No. 11) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of September, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the first day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

AUG WATERMAN, Secretary.

Office—Room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.
M. J. McDonald, Trustee	294	5,000	$700 00

NOTE. Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRACE CONNECTION FOR VEHICLE SHAFTS.—Jacob H. Wiscbeart of Sacramento, Cal., assignor to John Mason of Petaluma, Cal. No. 543,225. Dated July 23, 1895. The object of this invention is to avoid the necessity of a locking trace or tug. These parts of a harness are buckled at the forward ends to the hames or to the breast strap, and at their rear ends are connected with the singletree. The traces or tugs are thus very long, and, in unhitching a horse, care must be taken in disposing of these long parts to keep them out of the way. This disadvantage is obviated by this trace connection, which consists of a housing secured under the shaft and having a slot in its side, a slide within the housing having a lug projecting through and operating the slot thereof and adapted to receive the trace or tug, a spring seated within the housing and controlling the slide, a second spring on the other side of the slide to prevent rattling and a loop extending rearwardly from the housing with its free end secured to the shaft, said loop being adapted to receive the hold-back strap.

TIRES FOR VEHICLES.—A. J. Rudolph, Chicago, Ill. No. 543,704. Dated July 30, 1895. The object of this invention is to provide an elastic tire which may be used for vehicles of all descriptions in which the penetration produced by sharp obstructions upon the road will be reduced to a minimum and the flexibility and resiliency of the tire will be greatly increased, while reducing the trend to a minimum to save friction and expenditure of power. It consists of blocks or sections of elastic material elongated radially and attenuated transversely, threads of fabric forming a warp and weft therefor, woven through said blocks while in the elongated condition, the fabric being released after the threads are fastened, and interior air-proof surfaces or tubes allowing compressed air to be introduced therein.

BICYCLE BRAKES.—Jorgen Christensen, San Francisco, Cal. No. 543,723. Dated July 30, 1895. The object of this invention is to provide a brake which is easily applicable, and especially adapted for use upon the pneumatic tires or the rims of bicycles to produce a sufficient frictional and retarding effect without unnecessary wear of the substance of the tire. It consists of rollers revolvable upon diverging shafts, the meeting angles of which are connected with an arm or lever by which they are reciprocated so that the angle of the shafts to each other is increased or diminished by moving the meeting ends of the shafts in a line intermediate between the two, thus causing the rollers to press upon opposite sides of the tire, and turn with a frictional contact so as to interpose a resistance to the revolution of the wheel without a rubbing friction.

BICYCLE BRAKE.—Jorgen Christensen, San Francisco, Cal. No. 543,724. Dated July 30, 1895. This invention is of a similar nature to that previously described, and consists of rollers, shafts upon which they are loosely journaled upon opposite sides of the wheel, lever arms to which the upper and lower ends of the shaft are fixed, said arms being pivoted to and turnable about fixed supports so that the rollers may be made to approach to or separate from each other and press upon the wheel rim with greater or less force, as may be required.

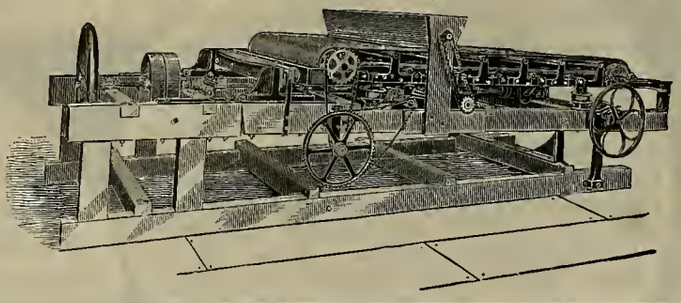
The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

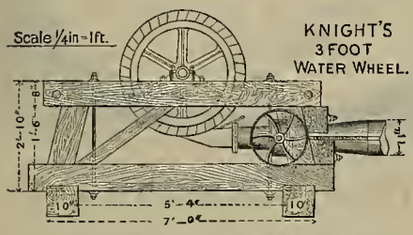


Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

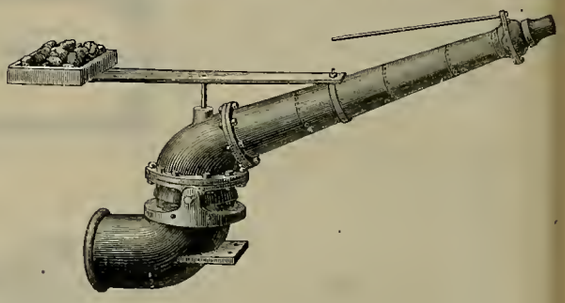
NINETY-FOUR AND ONE-HALF PER CENT
— SAVED —
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.



PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94¼ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.



RISDON IRON WORKS.

OFFICE AND WORKS, COR. BEALE AND HOWARD STS., SAN FRANCISCO. CABLE ADDRESS, "RISDON'S," SAN FRANCISCO.

The above outline cut shows the general arrangement of one of Knight's Standard Water Wheels, of which there are more than 450 in use in California alone. These wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000 horse power, and adapted to all heads and purposes.

FRUE ORE CONCENTRATOR.
OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

Sampling Gold Quartz.

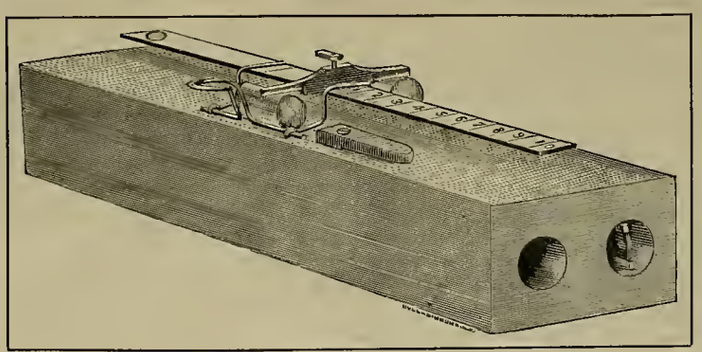
Articles in the MINING AND SCIENTIFIC PRESS of July 27th, August 3rd and August 17th, respectively, have furnished practical figures for practical assayers. It is believed that the information in those three articles thus appeared for the first time. With less claim to originality, but to complete the matter and present it in such shape as to be of the greatest practical value to the prospector, is herewith given a working test for determining the quantity of gold mechanically combined with auriferous vein matter.

The gold quartz from which the working test is to be made should be taken from the lode at the ends or face of the drifts, backs or croppings by an experienced, practical miner, in a quantity of not less than thirteen cubic feet, and a true average of the rock in sight. This broken thirteen cubic feet should be broken to the size of macadam stuff, of which, after a thorough mixing, two hundred weight, representing as nearly as possible an average of the whole, is to be placed on a piece of canvas about six feet square, in the center of which is a stamp die, and with hammers reduced small enough to pass through a two-inch riddle, the die then removed, and the canvas raised from each side, so that the broken quartz be well mixed, from which two samples of four pounds each can be taken. The four pounds samples should be passed through a hand rock crusher till fine enough to go through a sieve with thirty holes to the linear inch, or finer if desired.

An improved batea, as made by Justinian Caire of this city, will give good results.

When the miner is desirous of making a very accurate working test, two bateas should be used, so that the tailings from the first operation can be washed over again. The right hand fingers should also be covered with rubber cots, so that the grease from them may not float the gold; a little washing ammonia should also be added from time to time during the washing or panning out. In case there is any talcose or greasy matter in the samples of veinstone, it should be soaked in boiling water with a little caustic soda for ten or fifteen minutes before panning out.

When the gold and pyritic matter are brought together in the center of the batea, and well freed from the gangue, allow them to be covered with water, and with a bar magnet remove all magnetic iron, care taken at the same time that none of the gold is picked up with the iron.



When all the gold is well collected in the center of the batea, a little pure mercury is added sufficient to form a hard amalgam. This mercury, being rubbed by the finger covered by a cot, will rapidly take up the gold, the wooden surface of the batea greatly assisting the operation. The pyritic matter left, if thought to contain any gold, can be ground up fine with water and mercury in an agate mortar or roasted in a clay dish with a little nitrate of soda and then amalgamated. The four-pound samples are to be treated as directed, the resulting amalgam put in a piece of charcoal, and the mercury volatilized by the aid of a blowpipe; the resulting gold being weighed, the value per ton of rock will be found by the accompanying tables.

The balance and frame, as shown by the accompanying drawing, is made by John Taylor & Co., this city, is about seven inches long and one and a half wide and one inch deep. The balance is a German silver beam, six inches long and one-fourth of an inch wide; the fulcrum knife-edged and the bearings pieces of round glass.

On the right hand side of the fulcrum ten divisions are marked at equal distances from each other, and on the left hand side a small depression is made to receive the globules of metal or a small pan for gold dust. Above the fulcrum is a small vane, which, being turned to the right or left, adjusts the beam to equilibrium. The two small wires resting upon the beam keep it in place, while the globules to be weighed are being placed on the beam. By a very slight pressure with the finger the wires are raised and allow the beam to work.

The number of weights required are three, made of flattened wire, viz., ten grains, one grain and one-tenth of a grain. The weights are moved from one division to another, as required to balance the globules, keeping the flat side on the lines of division.

This balance is very sensitive and will weigh to the one-thousandth part of a grain. Holes are made in the wooden block to hold the blowpipe, pincettes, weights, charcoal, etc. The following table is to be used in connection with the balance:

THE POCKET BALANCE.

PROSPECTORS' AND MINERS' GOLD TABLE, TO DETERMINE FREE GOLD PER TON OF 2,000 POUNDS. SAMPLE FOR WORKING TEST, FOUR POUNDS AVOIRDUPOIS, 28,000 GRAINS.

Weight of Washed Gold—four-pound sample in grains and tenths.	Fineness, 870; value per oz., $16 12.	Fineness, 880; value per oz., $17 15.	Fineness, 875; value per oz., $18 08.	Fineness, 890; value per oz., $19 01.
5 grains	$83 97	$89 36	$94 20	$99 05
4 grains	67 18	71 49	75 36	79 24
3 grains	50 38	53 61	56 52	59 43
2 grains	33 59	35 74	37 68	39 62
1 grain	16 79	17 87	18 84	19 81
.9 grain	15 11	16 08	16 95	17 82
.8 grain	13 43	14 29	15 07	15 84
.7 grain	11 75	12 51	13 19	13 86
.6 grain	10 07	10 73	11 30	11 88
.5 grain	8 40	8 93	9 42	9 90
.4 grain	6 71	7 14	7 53	7 92
.3 grain	5 03	5 36	5 65	5 94
.2 grain	3 36	3 57	3 76	3 96
.1 grain	1 68	1 78	1 88	1 98

The following table is for determining the amount of free gold per ton of 2000 pounds average. Sample for washing, 29,166⅔ grains, approximately 4 pounds 2¾ ounces. Each grain of gold obtained after washing will, therefore, equal one ounce per ton. If the gold be—

750 fine, each ounce will be worth	$15 50
800 fine, " "	16 53
850 fine, " "	17 57
875 fine, " "	18 08
900 fine, " "	18 60
920 fine, " "	19 01
930 fine, " "	19 22
940 fine, " "	19 43
950 fine, " "	19 63

Hence, multiply the value per ounce by the number of grains to give the value per ton. Example: If the washed gold weighs 2 grains, and the fineness be known or estimated at say $16.53 per ounce, the sample shows $16.53×2=$33.06 per ton.

Tellurium.

Tellurium is found in small quantities all over the United States, commonly combined with gold, silver and bismuth. When present in ores of silver and gold, it renders their reduction by the process of amalgamation impracticable, so that smelting has to be resorted to. Copper bullion sometimes contains tellurium. Even when amounting to only $\frac{1}{100}$ of 1 per cent, it renders the copper so brittle as to be unfit for the finer uses, though it is good enough for castings. The business of freeing copper from the objectionable metal is conducted on a big scale, the largest works being located at Baltimore and at Bridgeport, Conn. From the copper in solution is precipitated a slime, consisting of gold, silver, arsenic, selenium and tellurium. The tellurium may be separated out by chemical means, but ordinarily it goes with the rest of the precipitate after the gold and silver have been saved.

Tellurium forms a remarkable alloy with aluminum. When the two are melted together in certain proportions, they suddenly combine with a loud explosion, forming a very brittle substance. This substance, when dropped into water, gives forth a peculiar and abominable odor. The same odor is communicated to the breath of anybody who swallows a small quantity of the alloy. The smell, in fact, is one of the worst producible in the laboratory, surpassing even sulphuretted hydrogen. Recently many experts in the science of chemistry have been trying to break it up, being convinced that it is in reality not an element but a compound of several elements unknown.

It is found in the Cripple Creek district, Colorado, and in Shasta county, this State. One of the Cripple Creek camps is named Telluride.

A peculiarity of tellurium is that a bit of it as big as a pin's head mixed with a pound of gold will make the latter as brittle as glass. Gold ordinarily is extremely tough, being so ductile that 900 square inches of ordinary commercial leaf are beaten out form a single dollar's worth. One of the most striking characteristics of tellurium is its extreme brittleness, as noted, both as regards copper and gold. It looks somewhat like silver and is very crystalline. It is slightly less heavy than iron.

NOTWITHSTANDING the depression of business in 1894, the United States exported $889,843,000 worth, against $847,665,194 in 1893. The English-speaking people of Europe bought of Americans $451,000,000 worth, and, taking British possessions altogether, they took $523,000,000 worth. The United States imported from Great Britain $107,000,000 in 1894, or sixteen per cent of our imports. Almost ninety per cent of the total United States exports were to the United Kingdom and British possessions, Germany, Canada, France, Netherlands and Belgium. Of imports, after the United Kingdom and British possessions, follows Germany with a valuation of $96,000,000; Spanish Indies, $82,000,000; Brazil and France, $76,000,000 each; and Canada, $37,000,000.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Pocket Balance, 117. Steamer "Bay State;" Electric Light Plant, Steamer "Bay State," 125. "Semi-Steel" Shoes and Dies, 130.

EDITORIALS.—Sampling Gold Quartz; Tellurium; United States' Exports in 1893, 117. "Is the Inventive Faculty a Myth?" The Mineral Land Question: Old and New Mining and Milling Methods and Conditions; The American Bimetallic League; Shall the Miners' Association Incorporate? 118.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 122-123.

SCIENTIFIC PROGRESS.—Light-Draft Gunboats; Cans Made of Paper Pulp; Hypnotic Influence; Calcium Carbide; Propelled by Electricity; A New Design of Automatic Marine Fog Signal; "The Line of the Crown," 124.

MECHANICAL PROGRESS.—Some Machine Shop Uses for Compressed Air; Paper Rims for Bicycles; Damascus Steel; Mechanical Rock Drilling at Danemora, Sweden; Cost of Steel Rails on the Pennsylvania Railroad; Coal-Dust Briquettes, 124.

ELECTRICAL PROGRESS.—A Triumph in Telegraphy; Water System of Chicago; Electric Light Plant on Steamer "Bay State," 125.

PRACTICAL INFORMATION.—The Most Precious Metals; A Road to Hudson Bay; Soldering "Uphill;" Aluminum not Available for Use in the Construction of Naval Vessels; An Ingenious Clock, 125.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 130.

MISCELLANEOUS.—Consentrates, 119. The Mines of Tuolumne County; Mariposa County, 120. Oregon's Gold Beaches; Old-Time Arizona Prices; Ancient Egyptians Well Informed as to the Qualities of Precious Metals; Composition of Gum on Back of Postage Stamps; New Trade Catalogues; Recent Additions to Collection of California State Mining Bureau; Artificial Waterway; Beaten the Record, 121. Coast Industrial Notes, 123. Compressed Air Transmission Six and One-half Miles Long; "Semi-Steel" Shoes and Dies, 130. Notices of Recent Patents, 131.

The Mineral Land Question.

On the 9th inst. the committee on protection to mineral lands of the California State Miners' Association was authorized at a meeting of the executive committee to consider an expressed desire on the part of the railroad company to arbitrate the question at issue between the corporation and the association as to what is and what is not mineral land in the unpatented area of Government land in this State. Representatives of the company were quoted as being desirous of reaching some amicable agreement, and, after considerable discussion it was finally decided that information be definitely obtained as to the corporation's attitude in the proposed arbitrament.

On the 20th inst. J. M. Wright, a member of the mineral land committee, addressed a letter to W. H. Mills, representing the S. P. and C. P. companies, asking him to state the corporation's views in the matter. The following day Mr. Mills replied at length, going over a part of the case in controversy. Speaking for the interests he represents, he recognized the existence of a grave dispute, and stated his desire to have such concurrent action by the corporation and the Miners' Association as would speedily, satisfactorily and definitely settle the entire question in a way that would be final and conclusive. In brief, his suggestions are that a preliminary examination of all the land in contest be made by experts; that these experts be two in number; the miners to appoint one, the corporation one, they to make thorough examination of the lists of land selected by the railroad company for Government patents; the Miners' Association to furnish satisfactory evidence that it is fully authorized to act for the miners of the State; that the joint report of the two examiners be binding on both the corporation and the miners, and their final findings be held and regarded by both sides as the legal basis of a final adjustment of the dispute before the Government or other legal officials; that as an essential requirement to this agreement and joint appointment the association shall cease all forms and modes of contest of the railroad's action or position in the matter of mineral lands; shall withdraw its affidavits, recede from its present position and in every way leave the matter, so far as the association and the miners are concerned, in precisely the position those matters were in before the mineral land committee began its present contest.

From his point of view Mr. Mills' requirements are logical and consistent. He represents the land department of the railroad company, is thoroughly conversant with the matter in all its details and fully understands words and their uses. He recites his willingness to arbitrate and couples his desire with the stipulations outlined above.

It is for the committee on mineral lands to make reply. It is for the five members of that committee to accept or reject the proposal, or suggest other terms of compromise. It is not a matter for individual notoriety or personal prominence. The committee is composed of intelligent, earnest men well informed on the subject and cognizant of their responsibility to the interests they represent.

To us it seems that the plan as outlined in Mr. Mills' letter is impossible of acceptance. It seems that to concede his stipulations would be a complete surrender of all for which the committee has fought, and an abandonment of the favorable position that has cost the association so much time, effort and money to secure. We are not expressing any opinion as to the wisdom of a compromise. Arbitration of any legal dispute when genuine is always less costly than adjudication by legal tribunals. Oftimes it is more satisfactory. It is usually swifter in results. But the proposition outlined by Mr. Mills in his letter of August 21st is onesided. Even to those who heartily favor compromise its objections are manifest. With no desire to oppose the idea in general, but looking at the matter from the miners' point of view, it is evident that were the committee on mineral land to accept the suggestion that it drop the fight, its members would make a grievous mistake. That corporation requirement alone appears to be an insuperable obstacle. To attempt elucidation of this plain proposition is unnecessary to those who understand the situation and useless to those who do not. Two commissioners are suggested, one from the miners, one from the company; both must agree; no provision is made for possible disagreement. There must be concurrence and unanimity of opinion throughout. If they disagree the whole scheme falls through. Meanwhile, in the possible event of their disagreement the miners would have abandoned the present contest, lost their present position and forfeited all right to renew representation of their claim. So that all that would be required for the railroad company to do that which it has so far failed to do—defeat, disintegrate or destroy the committee—would be to have the committee itself agree to Mr. Mills' proposition; rescind its action, abandon the contest, appoint a commissioner, let the company's commissioner disagree with the miners' commissioner, and the fight would be won—by the railroad company. The temptation to disagree would be a very strong one; it would be so easy, so natural, to decline to agree, and the results of such declination would be so valuable—to the railroad company.

Less could not be said: more need not be said. Sufficient is suggested to indicate that the acceptance of Mr. Mills' proposition in its present shape would be suicidal to the cause that the mineral land committee represents. Compromise is a good thing: arbitration has its merits: concession is worthy of consideration; but defeat is the same in its effect whatever the words or terms used in securing it.

A STRIKING CONTRAST between old and new mining and milling methods and conditions is afforded by the old bill in an Arizona mining camp, published in another column, and the report of the Alaska-Mexican Gold Mining Co. for '94. Alaska is more remote than Arizona, yet, last year that company worked 73,141 tons of low grade ore at an average cost per ton of $1.97½. This includes everything, and is illustrative of what skill and close management can do in a mine. Of that $1.97½ labor in the mine took less than 70 cents; supplies, 32¼ cents; labor in the mill took less than 24¼ cents; mill supplies, 33 cents; chlorination of concentrates cost 17¾ cents; "general expenses," 7¾ cents; the office in this city less than 1½ cents; bullion charges, 4 cents. Of course such a result would not be possible, even at the present day in Arizona; but it is worthy of note that in far-off Alaska, so remote from supplies of all kinds, a corporation was able to work in one year 73,141 tons ore that only yielded $2.79 per ton and yet make a profit of 81½ cents on each ton. Of the $2.79, $2.11 was free gold, the 68 cents coming from concentrated sulphurets. The year's profits were $59,640; the total receipts, $204,042.

"Is the Inventive Faculty a Myth?"

The above is the title of a thoughtful article in the current number of the *Engineering Magazine*, by W. H. Smyth of this city, in which he discusses the question affirmatively. He thinks that primarily there is no "inventive faculty;" that the ability to invent is not a special mental endowment nor the prerogative of genius, but that such faculty can be acquired by study and observation just as one would learn any mechanical pursuit which requires admixture of brains. It has been generally accepted as an unassailable proposition that "poets are born, not made," and similarly assumed in the case of inventors. Mr. Smyth argues that any rational human being possessed of the ability to see, remember and reason with accuracy can so use those mental qualifications as to assimilate principles already known in a concentration of purpose that may be classed as an "invention."

Here it becomes necessary to state with some degree of definiteness what is meant by the word "invention." Mr. Smyth's definition is a negative one. He quotes Prof. Robinson, who states that an invention is the "product of original thought," and holds that it is not; that invention is not creation, but intelligent selection, and may be the clever rearranging and adapting to new uses of principles already known, and from this premise proceeds to argue that by study and practice the power of invention may be strengthened and the process made more facile, and says: "It further follows that the operation of these faculties, like other processes, must be capable of being reduced to a definite system, governed by well-defined laws, with manifest advantage in respect to economy of time and effort and certainty of result."

The author goes on to argue that the most important prerequisite is the ability to know what to do and how to do it; to have a clear, exact idea of what is wanted and the trained skill to determine how to best supply the want. He proceeds to demonstrate with considerable strength the utility of his idea to form a scheme for the "Cultivation of Invention," or the "Science of Invention," incidentally suggesting that from patent law and patent practice should be eliminated the ordinarily accepted idea of "invention," substituting therefor "discovered" or "thought out," which would make the domain of "invention" more tangible and determinate. His suggestion of the course of mental training that would induce the ability to invent in the mind of any one of ordinary mental endowment is ingeniously stated and is worthy of study and respectful consideration.

A weed has been defined as "a plant whose uses are as yet undiscovered." Mr. Smyth's central idea is that there exists much in Nature for the trained eye and brain to educe and utilize, and that such adaptation, usually called "invention," is within the reach of the clear, cogent thinker. Looked at in the abstract, there is a great deal in the article with which to agree, and it is so worded that, if one cannot agree with all of it, he must at least accord merit to the idea and the mode of statement. In our opinion, however, the case is not proved. If one takes up special instances it appears manifest that great "inventions" have been made by gifted minds who must have been endowed with special ability that, in want of a better term, is styled "inventive faculty"—an ability that no amount of applied skill could more than supplement or aid.

In the closing part of his article, Mr. Smyth suggests the inauguration of "A Science of Invention," or a scheme for the "Cultivation of Invention," giving as a partial basis accurate and methodical observation; cultivation of memory, including the faculty of association; cultivation of clear visualization and logical reasoning from actual observation; and recommends a course of study with these ends in view. These suggestions are of value to the technical observer and in practice would undoubtedly be beneficial to the student or worker in any branch of applied mechanics.

DURING the week the American Bimetallic League held a convention in this city, attended by over 500 delegates from California and adjoining States. Several strong speeches were made for the free coinage of silver, a series of resolutions was adopted and the organization of a new political party discussed. It was determined to organize local bimetallic leagues and work for remonetization of silver.

"SHALL the California Miners' Association incorporate?" is a question well worth the attention of that body at its next annual convention.

Concentrates.

r Cripple Creek, Colorado, the quartz gold is finer than the er.

$150,000 FIRE devastated the mining town of Bingham, h, last Monday.

R. BENT, late foreman of the Le Roi mine, takes charge he El Plomo mine in Mexico.

HE Montana Ore Purchasing Company reports a July pro- tion of 1,457,000 pounds of copper.

HE annual meeting of the Nevada County Miners' Associa- will convene in Nevada City next Thursday.

AMES MALTMAN has leased the Lightner mine, adjoining the Utica on the north, and is now operating it.

V. KEELEY, of Vanderhilt, San Bernardino Co., has bonded mine, the Clementina, to a party of Englishmen.

HE Nelson *Tribune* says the proposition to erect a smelter he Upper Arrow lake will be laid over for a year.

PT. KERVIN, of the Hale & Norcross, has been looking at ephine county, Oregon, mines for the last two weeks.

OL. FRANK MCLAUGHLIN expects to get good present re- ns from sluicing at the Golden Feather, near Oroville.

HE Good Hope mine is working a daily force of twenty-five n. I. N. Boicourt of this city has been appointed superin- dent.

'94 San Bernardino, Riverside, San Diego and Los An- es counties produced $665,082 in gold. In '93 those counties duced $320,472.

HREE FORKS, a small mining town in the Slocan country, burned out completely last week, the inhabitants nar- ly escaping destruction.

HE Spokane Ore Co. has incorporated to operate in Trail ek, B. C., where they own twenty-three claims. The minal capital is $5,000,000.

. B. WEST has bought the Bode or Fellowcraft quartz e at San Andreas, Calaveras Co., for $4000, has men pump- it out and will sink deeper.

PT. HANLEY, of the Niagara mine, reports that the "lost n" has been found, which means considerable for French ch and that part of Shasta county.

A TWO-COMPARTMENT shaft is being sunk on the Turner mine Smith's Flat, Calaveras Co. Hoisting works and other chinery will be in place by September 1st.

V. A. CLARK has contracted for two additional furnaces to placed on his United Verde, Arizona, copper properties. It expected they will double the present output.

HE property of the Ruby Dunderberg Mining Company, ar Eureka, Nev., recently sold to close the business of the mpany, was bought in by the debenture holders.

A NORTHWEST MINERS' ASSOCIATION, modeled after the Cali- nia State Miners' Association, is proposed, to embrace all northwest Pacific States, with headquarters at Spokane, sh.

HE Old Flag Mining Company has incorporated to operate nes in Yuba county: capital stock $500,000: D. E. Miles, Stone, R. C. Walrath, E. C. Godfrey and J. V. Hunter are stees.

HE Austin, Nevada, *Reveille* says there are but very few e men in Austin at the present time, and every able-bodied n who sought a position has found one with the Austin ning Co.

WORK is to be resumed by J. W. C. Maxwell on the Ala- na mine, five miles from Sonora, Tuolumne Co. The mine ed to be a gold producer. There is an old 40-stamp mill on e property.

T is stated that either the Raymert Mining Company or e Columbia Company will erect a mill of sufficient capacity do the milling for both companies, in the Humbug mining trict, Arizona.

HE Last Chance mine, six miles from Prescott, Arizona, s been sold to Messrs. Levin, Dexter and Howes, of Chi- go, who will build a five-stamp mill. There is a four-foot ge of fair grade ore.

HE June gold output of the Witwatersrand, South Africa, nes is 200,941 ounces, 6000 ounces ahead of May. The Wit- tersrand local papers say the output of '95 will exceed $42,- 0,000. It looks that way.

CLARENCE S. KING, who recently bonded a group of mines in e Cargo Muchacho district, agreeing to pay $120,000 for em in six months if they held their richness, has assigned s contract to G. C. Tilden.

HE Reliance Mining and Reduction Company has incor- rated in San Jose: capital stock $100,000. Directors—S. B. ristry, E. McGrath, H. Kaler, W. H. Ham, E. F. Smith, . H. French and L. A. Sweet.

HE Bolivian tin mines are very rich, but they are gener- y situated at an altitude of 14,000 feet above the sea level, that, between high freights, lack of railroads and insuffi- ent capital, they are hardly developed at all.

HE Golden Star Mining Company has incorporated at ownieville, Sierra county; capital stock $100,000. Directors— M. George, Girard, Pa.; W. H. Sharp, London, Eng.; C. M. ilson, Asa Wilson, Downieville; V. Wallace, San Fran- sco.

DURING 1894 Calaveras county produced more gold than any her county in California. The aggregate output in gold of e county for the twelve months was $2,124,548. The prod- t of that county in '93 was $1,669,192. Its gold product in '92 as $794,531.

MINERS who make their own assays often find it difficult to rive quickly at the exact value of their ore, and such aders are referred to articles on that subject in the issues July 27, August 3, August 17, and the article on the first ge of this issue.

J. B. HARRISON, of Wakefield, Mass., has invented a non- rrosive pipe. The lining is of lead fastened to the interior pipes or pumps with an "elastic cement," which "contracts a degree proportionate to the expansion or contraction of he two metals which it unites." Where pipe is immersed in water containing sulphuric or other corroding acid, external corrosion cannot be prevented by that method, but where such a condition does not exist he claims practical indestructibility for his wares.

MRS. JOHN P. ST. JOHN, wife of the famous Prohibition ex-Governor, is at present, and has been for some time, superintending the engineering and other work of constructing a tunnel in a gold mine at Cripple Creek, in which her husband has a controlling interest.

THE employes of the Franklin copper mines at Houghton, Mich., have had their wages restored to the figure holding before the cut of 1893. A general cut was made in all copper mines of the district at that time, and it is thought that the restoration will soon be as general.

MANAGER DALY of the Daly-West, Utah, says that the order for the mill, with which that property is to be provided, will be placed next week, and its completion effected about the 1st of January next. There is considerable competition over the contract, for which bids are being solicited.

ORE SHIPMENTS hence from Mexico have been cut down considerably by the 5 per cent export duty imposed by the Mexican Government. Where steamers from Guaymas, Altata and Mazatlan formerly brought 400 or 500 tons of ore, they now bring less than one-fourth of that amount.

DURING the year ending July 30, '95, the mint at this city received 56,000 ounces more gold than for the corresponding twelve months. The figures from the Selby refinery exhibit additional proportionate increase. This is strikingly illustrative of the augmentation of the annual gold output of the State.

COLONEL SUTHERLAND, who is going to work the tailings at Candelaria by the centrifugal process, says the work of getting things in readiness for operation has been retarded on account of water. Workmen are digging ditch and laying pipe, and have completed the line as far as Basalt, several miles from Candelaria.

L. H. TAYLOR, of the United States Geological Survey, recently measured the volume of water in the Humboldt river at Golconda, Nevada, and found it to be 650 miners' inches. At its highest period this year, about the middle of May, the Humboldt's volume was 55,000 inches, which was less than one-half of its usual volume at high water.

BOISE, IDAHO, is probably the only town in the world whose streets are sprinkled with boiling water, and whose houses are supplied with hot and cold water from never-failing artesian wells. The hot water is also used for heating purposes in the winter. Sprinkling the streets with steaming water arouses the curiosity of all visitors who see the wagon for the first time.

W. B. MCSHERRY reports from Coulterville that Silas Stone and an armed posse have tried to jump the Crown Lead mine, Merced county, which he has had in charge. It is the property of the estate of the late Fred McCrellish, and is considered worth fighting over. At last accounts McSherry and four others had successfully repelled the Stone party with revolvers, and were camped on the field.

HEREAFTER the Montana prospector must dig a ten-foot hole upon his lead in order to hold his claim, exposing at least one wall of the vein. He has ninety days in which to record the notice of location, instead of twenty as heretofore. Omitting representation work will not be possible, for the jumper must do that much work when he relocates the claim. The work done by the previous owner will not count.

THE purchasers of the Planet and Satura claims in Fool's Gulch, Arizona, between the Congress and Yarnell mines, have incorporated under the name of the Planet-Saturn Mining Co. They are C. E. Clark, W. H. Sayward, E. D. Peters and W. A. Clark. The two claims cost $40,000, spot cash. Two shafts 900 feet apart will be sunk to a depth of 600 feet. The outcroppings show a decomposed oxidized iron, giving an assay in places of $175 to the ton.

DISCUSSING an article in last week's issue, in which it was suggested that the Anti-Debris Association's plans and purposes did not justify county aid, the Marysville *Democrat* closes by saying: "The *Democrat* believes that if the matter could be submitted to a vote of the people of Yuba county they would emphatically decide, as have the supervisors of Colusa county, that the appropriation from the treasury for the Anti-Debris Association is no longer necessary."

THE Katie mill and hoist at Basin, Montana, were burned on the 13th. Over 50 miners were in the mine at the time the hoist caught fire but all escaped without injury. Nine men were working on the 100 and knew nothing of the fire until Alex Glass, one of the owners, went down the west shaft and climbed to the 100 and notified them. The mill and hoist were completed this summer at a cost of over $100,000. The company carried $30,000 insurance and it is expected will again rebuild. The Hope mine and mill on the west was saved by hard work.

LAST TUESDAY the Virginia, Nev., Miners' Union adopted the following resolution: *Resolved*, That the Virginia City Miners' Union, in accord with the Knights of Labor of America and all labor organizations of the United States, by this preamble and resolutions, on and after the first day of September, 1895, do hereby create and maintain a boycott against all United States National bank notes, and pledges the Union and its members individually not to receive in payment of wages or other business transactions such notes, unless in such cases as are specially provided by law.

IT is again stated that the Revised Statutes of the United States (section 2,324), the present mining law of the land, provide that the period within which the work required to be done annually on unpatented mining claims shall commence on the 1st day of January succeeding the date of location of the claim. The enactments by Congress approved November 3, 1893, and July 18, 1894, were for the purpose only of exempting the miners from the penalty of forfeiture of their claims for not doing the assessment work in each of those years. Owners of such claims have until the 31st of December next to do the assessment work for 1895.

THE report of mineral resources issued by the Geological Survey says that antimonial ores have been found in a number of western States, chiefly in Arkansas, California, Idaho, Montana, Nevada and Utah, usually in the form of a sulphide, but also combined with iron, copper and lead. The product of the United States has risen from sixty tons in 1882 to 250 tons in 1894, valued at $45,000. Nearly the entire supply is from California. The production of platinum is still insignificant. The results of the examination of the black sands of Oregon beaches have proved a disappointment, the amount of platinum being scarcely noticeable, although the sand contains $1.55 in gold per ton.

THE Canadian Minister of Mines has sent to the recorders of the several mining divisions in Kootenay blanks which they are to fill in and return to the head of the mining bureau, if one should be appointed. The following are a few of the things on which the recorders must report: "Name of claims recorded since last report," "Owners," "Number of mining license," "Nature of ore," "Nature of hanging wall," "Nature of footwall," "Average width of seam," "Distance seam is traceable on surface," "Course of seam," "Strike of seam," and "Remarks." The Nelson *Tribune* suggests that the following be added: "Geological or formation period," "True fissure or gash vein," "Gangue," and "Assay value of ore." All of which the average discoverer of a mineral claim will, of course, know at the time of recording.

JNO. M. WRIGHT, a member of the committee for the protection of mineral lands, has written a letter to W. H. Mills, of the Southern Pacific Co., asking what definite proposition that corporation may desire to make regarding the determination of the question of the mineral character of that portion of the unpatented land in the State now in dispute. Mr. Mills in reply proposes a commission of two members to decide on what is mineral and what is non-mineral land; the Miners' Association to select one, the railroad company the other, both to agree. Meanwhile the association to abandon its contest and abrogate all present advantage gained, virtually conceding the whole thing to the company and putting the solution of the question into the hands of an adversary that sees itself seriously embarrassed by the energetic movements of a body that is now asked to commit suicide.

PROBABLY nothing in the world can be said to exceed in structural wonder of its kind the labyrinthian system of subsurface timbering peculiar to the Comstock, the sum of $55,000,000 being considered a moderate estimate of the cost of timbering the mines. The size of the timbers varies from 16 inches square and 24 feet long to the smaller pieces 8 inches square used in cribbing. The species employed are chiefly yellow pine, fir and cedar, fully two-thirds of the whole amount being the first named. Yellow pine has been taken from the lower levels of these mines so compacted by the enormous pressure it has withstood as to have a density and weight exceeding those of lignum vitæ. None of the timbers in the Comstock mines have yet badly decayed, and their life there cannot be accurately determined, but the heat and vapors of the mines appear to have a preservative effect.

ON Warm creek, Idaho, about four miles from American Falls, there is some novel mining going on. The ground which is a light granite soil, is plowed, scraped into a dump and then shoveled into sluices. There are ten men at work and they run two shifts, making $75 per shift. The peculiar thing about this is that it is the only instance in Snake river mining where gold is found in large and paying quantities in the soil. Heretofore it has always been the practice with miners to strip off the soil to a depth of from three to ten feet or more, according to the formation. It is against the experience and science of miners to find placer gold anywhere except in gravel, and usually miners would not look for it anywhere else. The man who made the discovery on Warm Creek is not a miner, but "gold is where you find it." There is a great amount of mining all along Snake river in the vicinity of American Falls this season.

ARIZONA can furnish a pretty good story as well as pretty good mines. Among the mines of Arizona was the famous Vulture, now the property of H. A. W. Tabor, fifteen miles southwest of Wickenburg, whence the ores were taken by wagon to be milled on the bank of the Hassayampa. The mine is credited with having produced over $10,000,000 in gold. In those days nothing save the best was milled, and in the waste dumps was found the building material for the town of Vulture. The mine worked on for a score of years with varying fortune, the town maintaining a large population, when the pipe line from the Hassayampa was washed away by the flood that followed the breaking of the Walnut Grove dam, the 100-stamp mill was closed down and the camp was deserted. Three years ago T. E. Farish secured a two years' lease of the property, fitted up ten of the stamps, put in a gasoline engine, got his water out of the mine and started to "cayoting" on the lower levels. Near the end of his lease he ran out of really good ore. In this extremity he bethought himself of the scores of tenantless houses. Every one was constructed of free milling iron oxide gold ore, and specimens chipped from the corners assayed an average of $20 to the ton. The veracious chronicler of the Hassayampa avers that for the last ninety days his stamp mill has run solely upon building material, much to the profit of its owner.

THE death of two mining papers in Denver, Colorado, and the consolidation of another, moves the *Mining Industry* of that city to say that it is "the oldest mining journal in the West." This brings up the question, "What is 'The West'?" "Where does 'The West' begin?" It is a question that has occasioned some recent discussion. The Boston *Traveler* says: "The West does not begin nowadays until the middle of Ohio, at least." The Salt Lake *Tribune* says: "The West does not begin until the Mississippi is crossed, and it is not quite certain that it begins until the Missouri is crossed." The Kansas City *Star* observes: "The West begins where it always did, and the Boston *Traveler* is much nearer right as to the eastern boundary than the Salt Lake *Tribune*." The *Star* goes on to say: "The political beginning of the West was the establishment of the great free Northwest Territory. The soon-to-be States of Ohio, Indiana and Illinois constituted the original Great West, as well defined as China or Japan. That country is still the original West, with additions and enlargements like Michigan and Wisconsin, and will always be the West. The Boston *Traveler* takes the view entertained by New England when people from that section began to move to Ohio. When the founders of Marietta went forth they were going to the West, and the northern strip of Ohio, filled at first with Connecticut people, was the 'Western Reserve.' The boundary has never been removed." Meanwhile, unhampered by sectional lines, the MINING AND SCIENTIFIC PRESS is the oldest mining journal on the American continent.

The Mines of Tuolumne County.

By Our Traveling Correspondent.

Entering the county at Robinson's Ferry, the first mines encountered are the pocket mines on Jackass hill. The greater portion of the hill is owned by Jim Gillis, the "Truthful James" of fame, who leases out the ground for 25 per cent of the returns.

The only vein on the hill that looks like a milling proposition is the Atlas, which is now under bond to Hale & Co. Old Fred Morris milled the surface of the vein in days gone by, and, his millman states, took out $11 to $24 a ton. The shaft and cuts show a series of quartz stringers carrying 5 to 15 per cent of sulphurets. The mine wants 300 feet of additional depth, when these stringers will either get together and make a vein or give out. The fact that all the pocket stringers on the hill pitch to and in depth must cut this vein leads the pocket miners to believe that in depth it will be a bonanza. There is a small camp of pocket miners on the hill at this time, but none are in pockets, though some of them have been peggiug away for three years without seeing the color. It is the size of the pockets found on this hill that encourages the miners to persevere, as but one pocket is needed to give them a good stake.

At Sonora, the Golden Gate is now in charge of S. Smitherum, the court having placed the Fisher interests in possession. He states that by driving a crosscut of 22 feet he cut the vein and got it rich as ever in the past. The shaft is now down 700 feet, with levels run 700 feet on the vein, all in good ore. The 10-stamp mill is crushing 22 tons a day, while the chlorination works handle the sulphurets, the mine being almost entirely a sulphuret proposition. The vein to the north and south is not developed.

North on the Stanislaus, J. S. Sublett has bonded his Chimney Rock Cons. to Messrs. Gould & Doyle, of Sonora, who are developing the same. The vein lies between granite and talc slate and shows visible gold very freely. To the east, the Starr mine has been sufficiently developed that the owners are about to erect a mill. This vein yielded very high grade rebellious ore in its past history. South and west, W. Shanwood is operating the Keltz and Ham & Birney mines.

At Soulsbyville, the Black Oak is reported bonded to Tom Ewing for $250,000. This mine has a large vein of heavily sulphureted ore, with 10-stamp mill. The old Soulsby is being reopened at the Pennsylvania shaft. In cleaning out the shaft quartz has been found that assays $100 a ton, confirming the reports that the ore from this shaft went $100 to the ton. The hoist is now up and work will be pushed with all possible speed, as the rainy season will drown out the present pump, though they have but to move the old Soulsby pump onto the shaft to handle all the mine's water.

This shaft was abandoned at 80 feet in the early days. Various theories are given, some that the vein faulted, others that it split and the wrong vein was followed. The fact remains that on the Soulsby shaft, north, the vein was worked to a depth of 800 feet and $3,000,000 extracted. It seems probable that the vein pinched and the miners stopped, instead of sinking on the seam until the vein came in again, as they did at the Sou sby shaft.

Just east of Soulsbyville, Messrs. Hill & Hill are taking the water out of the old Louisiana mine. At the Stud Horse the shaft is now down 1400 feet, with very good ore going to the mill. This section is all above Sonora in the granite belt. South the mother lode courses through the country, which at no time made the showing that it now does. I know of no section on the lode where there are so many mines with as rich ore as they show.

The Rawhide, from a value of $5000 at the time the present owners took hold of it, has made its owners wealthy and increased in value to $2,000,000. The bond that was on the property expired on the 7th of July, the parties failing to put up the $50,000 for it, and thus conferring a favor on the owners. As previously stated, the plant on the Rawhide is the most extensive and complete of any property in the county. Adjoining the Rawbide on the north is the Rappahannock, the property of Mr. R. Chute, a gentleman whom it is a pleasure to meet. Mr. Chute has his shaft now down 360 feet and is sinking. The shaft was put down on the hanging wall. At 30 feet a 4-foot vein was crosscut; at 50 feet, a 4-foot vein; at 80 feet, a 2-foot vein; at 200 feet, a vein came in wider than the shaft for 60 feet; at 345 feet, a 5-foot vein was crosscut. As the shaft goes down all of the veins of the mother lode will be crosscut, and when sufficient depth has been secured crosscuts will be run to the vein and levels extended. On the mine the veins are very modest, hiding their heads throughout the entire length of the mine, but a shallow crosscut shows them up in good width. The mine has a good hoist. To the north of the Rappahannock is a long stretch on the lode that is idle and should be given depth. Northeast, and about 1200 feet from the mother lode, Mr. J. L. Whitney is opening up the Darrow mine. His shaft is now down 125 feet. The vein has widened very rapidly in last 25 feet. At the time of my visit they had just put off a shot and the quartz thrown out was full of leaf gold in white quartz, similar to the famous Idaho mine of Grass Valley. Mr. Whitney pounds out an average of $100 a day from the rock extracted in sinking. Following the rich eighteen-inch vein of quartz are numerous small seams of quartz which, with the slate, carry a large per cent of sulphurets that assay $168 to the ton. Everything indicates a milling proposition of good size, and at 150 feet a crosscut will be driven to prove it. A hoist has been erected and two three-stamp batteries are on the ground for the mill. South of the Rawhide is Rawhide No. 2, the property of Alvinza Hayward and the Hobart estate, on which nothing is being done. Still south follows the Alabama (idle) and then the Crystalline, now being developed by a tunnel by Messrs. Rapp and Shafer. They have a very good shoot of ore and only need development. South is the old mine of the Seebers, which is being opened at its south end. Then follows the Gem, for a long time operated by Mr. Harris and now worked by his family at a good profit. Next is the Tyro of Alvinza Hayward, a mine that has been gouged out all along and across its surface by the pocket miners and that made Whiskey hill famous. This, too, is idle. From this the lode runs to Quartz mountain and the new town of Hent. The first property to the north is the Dutch, A. Grittenbach superintendent. The company has just erected a small but first-class mill to test the veins as they are developed. The surface shows all the veins within the mine's side lines close to the center and but a few feet apart at the shaft. The shaft is on the west vein, which is generally conceded to be the poorest, though the bottom of the shaft shows very good ore and will now be put down to 500 feet, when it will only be necessary to drive a short crosscut to cut the other three veins and work them all through this shaft. As the east vein is generally the bonanza vein of the lode, the Dutch stands to make a big winning as the shaft goes down and the crosscuts go east. With the App down 800 feet at the south end of the Dutch and in good ore, there is no more promising property on the lode than the Dutch, and time will place it with the best of the mother lode mines. Immediately south is the App, operated by the Rawhide Co. The shaft went down through several hundred feet of vein until the present shoot was cut, which shows up well at 800 feet, and the company is now straightening the shaft and gradiug for a large hoist.

South follows the Knox & Boyle, Grey Eagle and Holmes & Miller mines, operated by the Napa Quicksilver Co., with Mr. W. A. Holmes in charge of the group, which is known as the Santa Ysabell. The mines are opened by tunnels driven in from both sides of Quartz mountain, with chambers at the terminus for electric hoists on the Knox & Boyle. South on their Holmes & Miller two shafts have been put down and will now have electric hoists erected. The company has three known shoots of good ore to commence with. At present Mr. Holmes is erecting the poles for their electric plant, which will soon be in place. They have their own water for power, and a bright future is before them. South is the Erin Go Bragh, which has a shaft going down. Then follows the Golden Rule, E. R. Stent superintendent. This mine is well named, great masses of quartz and diabase showing seams passing through them with continuous streaks of gold, while a huge chest shows hundreds of pounds of quartz filled with gold. While these very rich masses are put to one side, the ten-stamp mill pounds out an average of $22 a ton from the remaining rock. Mr. Stent counts the shoot good for 1100 feet in length, and justly asks "Where is there a better mine on the mother lode?"

South is the New Era, with shaft down 65 feet and sinking; then the Jumper, with H. W. Coffin superintendent. This mine has "jumped" into prominence by the large amount of gold it has yielded from the small amount of work done on the mine. The shaft is now down 145 feet on the 12 to 18 foot vein and drifts 130 feet. A ten-stamp mill has been erected, and the month's run has given the fortunate owner an average of $26 a ton. The ore is of the same character as the Golden Rule—quartz and diabase—and the showing in very rich rock alike. This covers Quartz mountain and the new town of Stent, or what has been known as Poverty Hill. There is no point on the lode where there is the same showing of so many rich mines as this immediate section from the Dutch on the north to the Jumper on the south now shows. In this section the veins pitch to the east, while the slate seams cut across from the southwest to the northeast, thus throwing the shoots north instead of south, as elsewhere on the lode. South of the Jumper there is nothing doing until Jacksonville is reached. Here the Mammoth Mining Co. is pursuing the even tenor of its way in the development of its property by tunnels.

The Eagle and Shawmut, that adjoin on the north, have recently been bonded, and are being developed. South is a long stretch of idle lode to the old Wheeler Hill mine, in charge of F. H. Hill of Chinese Camp. Mr. Hill is just getting into shape to work, and, as he was absent at the time, I did not secure any information in regard to the mine. South of this along Moccasin creek to Mariposa county, and on down through Mariposa to Coulterville, is a long stretch of undeveloped mother lode open to location. West of the mother lode about five miles, and about opposite to the Rappahannock, Mr. T. M. Lane of Angels has bonded the Pino Blanco and is proceeding to develop the mine. There is a big blowout of quartz here that forms a hill in itself. In this hill an open cut has been driven in the past and some very rich pockets extracted.

Passing south to that justly famous hotel, Priest's, we feast the inner man and drive out to the old town of Big Oak Flat. Here the miners sluiced off and up the side of the mountain until a quartz boulder got in their way and had to be broken up. In its separation $11,000 was extracted, and the Scorpion mine discovered in '54—a strong ledge that yielded numerous pockets to a depth of 60 feet, when, on account of the water, the work was stopped. Recently, Mr. A. Mack has come back to his first love and erected a hoist on the mine and will give it depth. The mine is now known as the Mack mine. While the owner keeps his weather eye open for the pockets, the seven-foot vein carries a good per cent of sulphurets that assay $253 a ton, which, with the gold in the vein, outside of the pockets, makes it a very fine proposition. Just north is the Longfellow, which, like the Mack, has only been worked to water level and has given over $120,000 in pockets. It is now idle. Big Oak Flat rests on her laurels and waits for the Mack mine to waken her from her present slumber.

Taking the county as a whole, the mining outlook steadily grows brighter as mine after mine is developed and shown to be valuable. For the courtesy shown your correspondent by every person I called upon in the county, I take this opportunity to express my thanks. E. H. SCHAEFFLE.

Murphys, Cal., July 29, 1895.

Mariposa County.

From Our Traveling Correspondent.

Entering the county from Priests, no mines are encountered until Coulterville is reached. Here the Merced Gold M. Co., T. M. Couch, general manager, have secured the mines on the mother lode formerly owned by the Cook estate. The mines cover both branches of the mother lode, which are here over a mile apart, and about 2½ miles on each vein, with Coulterville about in the center of the property, which is composed of twenty full claims.

To operate the mines they have secured the Big Oak Flat ditch, which has its source in the Tuolumne river at a point about thirty miles northeast of Coulterville, and have an electric power station on the Merced river, to the south. At present, the shaft on the Louise, at Coulterville, is down 22[illegible] feet, with boilers in place and grading done for large hoist. This is on what is known as the east vein thigh. There is still another vein about 75 feet east of this ledge. South about 1½ miles another shaft is down about 400 feet on the Mary Harrison, while to the northwest, on the west vein a shaft and tunnel are driven on the Malvina, and a large hoist is in course of erection. South, on the Potosi, a tunnel is being driven through the mountain.

While all the work may be said to be preliminary, the whole shows that it is in the hands of experienced operators, who do not hold out $5 in one hand and expect $20 in the other, but expect to put up, and put into, the mines every dollar that can be invested to a profit. All of the machinery is massive and of good quality.

The rush which first took place to Coulterville has subsided, and many are leaving. It takes time to develop a mine and do it properly, and it will be a of two years before Mr. Couch gets this extensive plant in full operation. When that time comes Coulterville will come to the front and speak for itself in its bullion output.

South and west of the Potosi is the Tyro, John McLaughlin, superintendent. This is an old mine. The present company have pumped it out, put the shaft down to 600 feet, and are sinking to the 700 foot level. The Tyro's reputation is that of an exceedingly rich mine.

Northwest of Coulterville about ten miles is the Louisiana, G. W. McKenzie and J. D. Gore, proprietors. The mine has an 85 and 160-foot shaft down on a 5 to 40-foot vein, between a porphyry hanging and a metallic slate foot wall, with a gouge one to three feet wide. The property is called a fine proposition and is under bond at this time.

Owing to the extreme heat (105° to 112° F.), I did not go south of Coulterville. As is known, there is nothing below Coulterville, save at Hornitos. The lower part of the county is covered by the Mariposa grant, which bars out all mining in that vicinity. There is a great deal of virgin ground in the north of the county that only needs water to make it a desirable section to develop. This can be secured, capital, from the Tuolumne river. If the ground should fall into the hands of a company like the rustlers from Montana who are now awaken Coulterville, Mariposa would soon be as well known for her mines as she is for her grove of big trees and famous Yosemite. E. H. SCHAEFFLE

Murphys, Cal., July 29, 1895.

Oregon's Gold Beaches.

The sea beaches of Oregon have been the recent subject of investigation by the Geological Survey. I. V. Winchell and F. F. Sharpless were sent three months ago to explore these sands, concerniug the possibilities of which as a source of wealth there has been much speculation. They report them to contain not only gold, but also considerable quantities of platinum, as well as other rare and precious metals. In one spot they report 50,000 tons of sand that holds two to five per cent of garnets and rubies.

Messrs. Winchell and Sharpless report that in their opinion the gold and platinum might be extracted profitably from these beaches, while the rubies and garnets would be valuable in the manufacture of emery wheels.

The sands of the Pacific seashore are rich in gold from Mendocino in northern California to the mouth of the Umpqua river in Oregon. Cliffs on the ocean front commonly contain gold; where washed by the waves, the shore for miles actually glitters with speckles of the yellow metal. What appears to-day, however, is either washed away or deeply buried to-morrow. Many attempts have been made to extract the precious stuff from the sands, but, as a rule, they have been unprofitable. The metal-bearing strata are some distance below the surface, and the overlying material is apt to be washed back by the sea as fast as it is removed.

In a few places such work is still carried on at intervals, and each year these beaches contribute something to the world's store of gold. The locality upon which Messrs. Sharpless aud Winchell bestowed their chief attention was near the mouth of the Coquille river, in the southwesteru part of Oregon. The tract here explored extends along the sea coast for two miles, and runs about an equal distance inland. Digging discloses the fact that the sands are divided into well-defined layers, and in them are embedded many stumps and trunks of trees, some of them of the gigantic redwood. Naturally, the metals. being heavy, occur in the deeper strata. Gold and platinum are found mostly in a layer of black sand which varies in thickness from a few inches to twelve feet. On top of the black sand is a stratum of gray sand which is not so rich.

The gold in these sands occurs in the shape of minute scales. These yellow flakes are so extremely small and thin that frequently they will float in water, on account of minute air bubbles which collect upon them. Some of them are almost microscopic, and often they have the form of small cups or basins. Here has been a fruitful cause of disappointment to miners. When a prospector under ordinary circumstances finds twenty or thirty specks of gold in his pan, he assumes that the material would yield at least $2 to $3 to the cubic yard. These sea beach scales are so very thiu that the average value of 600 "colors" is only one cent. It is a remarkably large "color" or scale that measures an eighth of an inch in diameter.

The sands in the locality described have been washed and scoured very clean, having been subjected to the action of the Coquille river and of the waves of the Pacific. Their accumulation at this point has beeu caused by the opposing forces of the river and the ocean. The deposits have been laid down within the age of men, as is proved by the character of the tree trunks and geological indications. Careful tests demonstrated that to work the gray sands would not pay, inasmuch as it yielded only seven cents a ton on an average. The black sands, however, hold from 50 to 75 cents in gold per ton, and their treatments for its extraction is regarded as a problem worthy of serious consideration.

A good deal of platinum is found associated with the gold in these beach sands. At preseut market rates it is worth $6 an ounce. A couple of years ago a big syndicate bought up the entire visible supply of this metal, actually setting out to purchase all the scrap platinum existing in the world. But there was more of the latter than had been counted upon, so it was found impossible to control the market. This speculation carried the price of the substance up to $18 an ounce—a circumstance very annoying to scientific men. who use it for instrumeuts of precision and especially for chemical apparatus, inasmuch as it will stand the fire of the blowpipe aud does not corrode. Electricians also utilize quantities of platinum—an inch of wire for each incandescent lamp, in connection with telegraphic instruments, aud in every place where the passage of a spark creates ozone to oxidize the metal poiuts it passes between.

Messrs. Winchell and Sharpless express the opinion that platinum could be extracted from the sands at the mouth of the Coquille river at a profit. It is found on the Pacific coast wherever gold occurs, though its distribution is not uniform, much being discovered in some places and very little in others. Samples submitted to test yielded two ounces of platinum to the ton of sand, which is enough to pay. Four-fifths of the platinum that supplies the world is obtained from two mines in the Ural mountains, Siberia. They are gold mines, the platinum being a by-product. Both metals are got from "placer" deposits, being found mingled with the sands that have been worn away from the hills by running water. Twenty-nine hundred carloads of earth must be washed to yield fifteen pounds of platinum. Nuggets are very rare.

Samples of sand assayed by the two experts yielded small quantities of those rare metals, iridium and osmium, but it is very doubtful whether they could be extracted profitably. Iridium is now quoted in the market at $15 an ounce, and osmium at $60 au ounce. The latter, it will be observed, is nearly three times as precious as gold. Iridium and platinum are the only metals that are heavier than gold. The former is utilized to some extent for making scientific instruments, not being susceptible to corrosiou.

In the beach sands described are found considerable quantities of a very extraordinary white metal, or rather mixture of metals. This uatural alloy, known as "iridosmium," is composed of iridium, osmium, rhodium, platinum and rutheuium. Rhodium, by the way, is quoted at $112 an ounce; but it is by no means the most precious of metals, gallium being worth $3000 an ounce. These metals are mere laboratory curiosities, however; the prices are nominal, inasmuch as there is almost no market for them. The only important use for iridosmium is in tipping gold pens. It is employed in this way because it resists acids. For the purpose mentioned the grains of it, which are flat, like gold-dust, are picked out from the sand with magnifying glasses.

It should be mentioned that the sands of all beaches contain gold, though the quantity is usually too small to pay for separating it. There is so much gold in sea water that a single bucketful of it reveals a yellow trace on analysis. Every ton of water in the ocean contains about one grain of gold, which is enough to gild 56 square iuches of surface; or it may be drawn out into 500 feet of wire.

The suggestion to the effect that the rubies and garnets in these sands might be utilized in the manufacture of abrasives is an important one. In 1893 there were 1713 tons of emery produced in this country, worth $83 per ton. The value of the emery imported during the same year amounted to $127,767. Rubies are better than emery as a material for emery wheels. The sands all along the coast of Oregon hold a large percentage of magnetic iron. This is easily separated by means of magnets, and the invention of the electric furnace has made it practicable to smelt it. Eventually it may become feasible to concentrate the sands from the iron, producing steel of exceptioually fine quality for certain purposes aud saving the gold and platinum as by-products.

Old-Time Arizona Prices.

Near Chaparral, Arizona, recently, au old prospector, looking over some papers in the office of the Belcher mine, found an old bill, yellow with age, of which the following is a copy:

MINERSVILLE, May 14, 1867.

Big Bug Mining and Milling Co.:

1000 lbs. flour @ $35 per cwt.	$350 00
2 sacks bacon @ $2.10 ₱ lb.	105 00
30 lb coffee @ 60c ₱ lb.	18 00
2 5-lb cans baking powder	10 00
1 sack sugar, 120 lbs., @ 40c	48 00
1 sack beans, 100 lbs., @ 40c	40 00
25 lbs. dried apples @ 75c	18 75
3 gallons syrup	12 00
5 lbs. tea @ $2 ₱ lb.	10 00
2 hams, 30 lbs., @ 75c	22 50
20 lbs. salt @ 35c	7 00
1 box pepper	2 00
20 lbs. dried peaches	20 00
2 shovels	7 00
4 picks	16 00
4 pick handles	5 00
3 joints of 6-inch stove pipe	6 00
One-half doz. tin plates	3 00
Freight on com., 105 lbs	26 25

Fifteen cents a pouud freight was paid on a stamp mill weighing many tous, $6 a day to the miners and as much more for as many guards to watch the Indians. The wonder is any mine paid there at any price for the product. At present, in the same regiou, a miue can be worked as cheaply for labor and supplies as in any part of the coast.

THE ANCIENT EGYPTIANS must have been well informed as to the qualities of the precious metals. In M. Berthelet's analysis of the gold necklace which the Princess Noub-Hotep wore he finds that there was 82.94 per cent of gold, 16.56 of silver and 0.50 of copper. King Kor-Fou-Ab-Ra's coffin was covered with gold leaf, which was composed of 85.92 per cent of gold, 13.78 of silver and 0.30 of copper. The silver diadem found with the Princess Noub-Hotep contained 69.19 per cent of silver. The actual quantity of silver in au object can only be determiued approximately, because through time the metal becomes in part converted into a chloride.

THE gum on the back of the postage stamps of the United States is made from alcohol one part, acetic acid one part, dextrine two parts and water five parts.

New Trade Catalogues.

Fulton Engineering & Shipbuilding Works, 213 First St., San Francisco: Illustrated descriptivo catalogue of mining machinery, includiug ore buckets, water buckets, miuing ore car, car wheels and axles, self-dumping incline and vertical skip, single and double-deck hoisting cage, ore bin gate, hoisting tramway, incline gravity tramway, horse powers, portable mining hoist, Pelton water wheel hoist, pony and reel hoists, Cornish pumps, triple-throw mining pump driven by electric power, horizontal tubular boiler, Deane pumps, etc.; 96 pages, 6x9 inches, with tables of sizes and prices.

Risdon Iron Works, Beale and Howard Streets, San Francisco: Catalogue No. 7 (3d edition), illustrating and describing grizzlies, rock-breakers, ore feeders, shoes aud dies, stamp batteries, rotorts, melting furnaces, prospectiug mills, the Johnston concentrator, chlorination mills, wet and dry crushing silver mills, the Boss amalgamation process, roasting furnaces—Buckner, Stetefeldt aud O'Hara, lixiviation process, Bryan roller mill, arrastras, percussion tables, siziug screens, crushing rollers, hydraulic separators, water wheels, waterjacket furnaces, hydraulic giants and elevators, mining cars, wire ropeways, etc.; 136 pages, 7x10 inches, with complete detailed description of machinery for mining, milling and reduction of gold, silver and copper ore, comparative cost, useful plans, tables, formulæ, etc.

Law Battery Co., 39 Cortlandt St., New York: Illustrated treatise on electrical batteries and electro-therapeutical apparatus, adapted mostly for experimental and laboratory work, 52 pages, 7x10 iuches.

The Edward P. Allis Co., Reliance Works, Milwaukee, Wis., D. B. Hanson, Mgr., 9 Fremont St., San Francisco: Illustrated catalogue of miniug, milling and smelting machinery, Reynolds-Corliss engines, Blake, Allis, Gates and Dodge crushers, Allis crushing rolls, mortars, prospecting mills, amalgamating apparatus, steam stamps, jigs and screens, the Reliance and Castlenau concentrators, Pearce and Howell-White furnaces, miuiug cages, ore cars, blowers, boilers, mine pumping and hoisting engines, air pumps, condensers and compressors, rock drills, etc.; 128 pages, 6x9, profusely illustrated, with tables of sizes, prices, and detailed description.

Clayton Air Compressor Works, 26 Cortlandt St., New York: A revised treatise on "The Widening Use of Compressed Air," with additional matter regarding its prominence and success as utilized for power purposes, includiug numerous testimonials, advertisements of business firms, etc., handsomely illustrated; 104 pages, 8x11 inches.

Chas. D. Mosher, No. 1 Broadway, New York: A treatise on the steam separator, its object, action and applicatiou, showiug its principles, efficiency and econonomy of operation; 40 pages, 4x6 inches.

Sullivan Machinery Co., 54-60 N. Clinton St., Chicago, Ill.: The Sullivan prospecting core drill is illustrated and described, with directions as to puttiug it up and running it; portable hoilers and steam pumps, portable forges, etc., are also treated in detail; 84 pages, 7x10 inches.

The Parke & Lacy Co., 21 and 23 Fremont St., San Francisco: Catalogue No. 70, illustrating and describiug the process of pumping water hy compressed air with the Pohle air lift pump; a treatise on the subject of raising water by that power and its practical application through the pump described, with numerous testimouials, specifications of different dimensions of Ingersoll-Sergeant air compressors, with details as to construction and prices, profusely illustrated with eugravings and sectional drawings; 36 pages, 8x11 inches.

The Ferracute Machine Co., Oberlin Smith president, Bridgeton, N. J.: Catalogue No. 11, an illuminated description of over 300 kinds and sizes of presses, foot and power lathes, beaders, dies for working har aud sheet metal, artistically produced, with full information as to prices, styles, etc.; 36 pages, 10x13 inches.

The M. C. Bullock Mf'g Co., 1171 Lake St., Chicago, Ill.: Catalogue No. 27 (3d edition), a finely illustrated descriptiou of the central valve engine, the Gunning & Campbell eugine, reproduction of results of a test of Siemens-Willans dynamo and engine, with other up-to-date information; 40 pages, 8x10 inches.

Recent Additions to Collection of California State Mining Bureau.

Limonite, showing a very beautiful wavy and banded structure; Calaveras Co., Cal.; W. H. Storms.

Fossils illustrating the geology of the Santa Paula oil region.

Hydro-dolomite, crystallized; corner of Webster and Ridley Sts., San Francisco; S. H. Herring.

Limonite from a volcanic crater of unknown depth near Reno, Nevada; C. L. Canfield.

Several specimens of auriferous pyrrhotite; the ore of the uew Trail Creek district, Rossland, B. C.; H. Adam.

Very superior clay with about 40% of alumina from Castella, Shasta Co., Cal.; L. N. Girard.

Twelve specimens ores and minerals from the State Sehool of Mines, Golden, Colorado, includiug typical Cripple Creek gold quartz with tellurides and fluorspar, natrolite, native silver, etc., etc.

Gold quartz, high grade; Gold Chief mine; Goff's district, San Bernardino Co.; Mrs. J. Young.

"Plum-blossom rock;" sent from Kyoto, Japan, by Miss L. Garvin.

And many others. HENRY S. DURDEN, Sec'y.

THE Manchester ship canal does not earn enough to pay interest ou the bonds issued to build it; and the Corinth canal does not even pay its operating expenses. The North German canal is too new to have a record yet. But Russia, regardless of discouraging precedents, is considering the idea of an artificial waterway 1,000 miles long, conuecting rivers that empty into the Black and Baltic seas.

Two students at Cornell University recently made a steam engiue that yielded one-horse power for every 11.67 pounds of steam consumed. Professor Schrœter, of Munich, has beaten this record by superheating the steam to 670 degrees Fahrenheit. He used only 10.2 pounds of steam per indicated horse power.

Mining Summary.

CALIFORNIA.

Amador.

BONDED.—I. R. Bearce has bonded the Poker Bill quartz claim to San Francisco men. It adjoins the old Contraras mine, which formerly yielded $350,000.

JACKSON DISTRICT.

THE GOOD HOPE.—Chas. Peters is pumping water out of the shaft of the Good Hope mine. He bas a reservoir on the creek above the mine for water power with which to run the pump.

Butte.

THE CATSKILL MINE.—The Catskill mine is reported to be turning out gold at the rate of $2.50 a pan.

SELLING DUST.—*Times:* There is an an unusual amount of dust coming in for this season of the year. The banks say that most of the dust they handle is brought in by white men in amounts ranging from $10 to $250 at a time. The average price paid is $17.50 an ounce, though some gold runs higher. T. L. Vinton, at Cherokee, pays $18 in trade for gold from the Spring Valley placer mine, which is considered the purest gold in the section.

CRUSHING ORE.—J. S. Williams, who has a contract to crush twenty tons of ore for the Spring Valley mine, finished the contract last Saturday. The quartz ran lower than was expected, but it should be remembered that it did not come from the main lead. Saturday he crushed 500 pounds of surface croppings from the main lead, which yielded $36.

T. J. Sparks will begin crushing the remainder of the ore on the dump in a day or two. It is expected that work will be resumed in the tunnel in a few days.

THE GOLD BANK.—A French syndicate is reported to have made H. P. Snow a handsome offer for the Gold Bank mine at Forbestown, which was taken under advisement.

Calaveras.

MINE EXTENSIONS BONDED.—The McSorley brothers have given a three years' working bond of the Gwin mine extensions Nos. 1 and and 2, to M. B. Kerr for $30,000, one-half of the net proceeds to be paid to the owners until the sale is consummated. This property adjoins the Gwin on the south and consists of 2250 linear feet of vein. It is proposed to put up machinery of the same capacity as the Gwin and commence sinking at once. Although the property has never been prospected beyond a depth of 100 fect the indications are good.

GENERAL NOTES.—The hoisting works at the Edna mine are finished. The whim's lifting capacity is 1200 pounds to a 100-pound strain. Two shifts are at work sinking the shaft and will be kept going until the 200-foot mark is reached.

Ford brothers have bonded the Big Pine mine. The Leonard brothers worked the ground some years ago and in a week took out four pounds of gold, one piece containing $76. Several attempts have been made to purchase the Leonard mine, now owned by an eastern company, but the only answer to all advances is that the property is not for sale.

The contractors who are digging the ditch for the Donnollan mine will soon have the contract finished. It is reported that ten more stamps will he added to the Donnallan mill.

The Thorn mine was pumped out this week, and parties are now examiniug it.

The pumps at the Utica are working night and day, but it will be a month before the mine is dry. Water is being pumped from the Stickle and south shafts through the north shaft.

Work on the Thorpe mine is being steadily pushed. The shaft is down 350 feet and the ledge shows up well.

Del Norte.

BLACK SAND MINING.—The Del Norte *Record* thus describes the process used in extracting gold from black beach sand near Crescent City by Edw. Yates:

Mr. Yates is at present working seven men. They were engaged at time of visit in "stripping"—that is, throwing to one side the sand not thought worth while working, in order to get at better paying material. When the good sand is reached it is carried to the "dump box" and thrown in. The water falling on tbis, washes it to the next box known as the "tom." A piece of perforated iron at the lower end of the "tom," permits the sand to pass through onto two plain sheets of copper, covered with quicksilver—the stones being held back in the "tom" and thrown away. From the plain copper sheets the sand is washed to the next drop—which consists of about five feet of corrugated copper, amalgamated with quicksilver. The gold is retained on these copper plates—only a very small percentage being lost. The sand is washed from the corrugated plates onto what is known as the "blanket" and from thence carried off and thrown to one side.

The copper plates are then taken in and warmed, then scraped, and in this manner the gold is secured. Mr. Yates is at present running three wheelbarrows, and disposing of about twenty tons of sand a day. The average yield to each wheelbarrow in sand mining is from five to seven dollars a day.

El Dorado.

THE CHANNEL BEND CO.—*Gazette:* The Channel Bend Mining Company, near Volcanoville, has eight men at work running a drift tunnel into the gravel beds, building roads, flumes, etc., preparatory to working the mine.

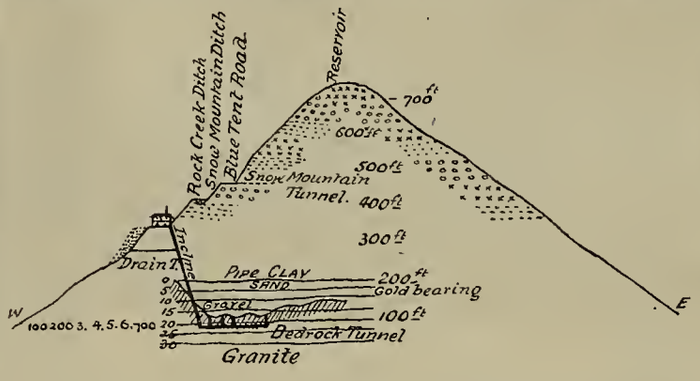
Lassen.

DIAMOND MOUNTAIN.—There is some interest in the Diamond Mountain mines. The mill is running at the Union Mine. Judge Goodwin and son have recently become interested in the Lone Pine mine with J. R. Perkins, and will develop it.

Mariposa.

GENERAL NOTES.— The new twenty-stamp Whitlock mill is in operation. There are seventy men employed. The employes are mainly Cornishmen, who have been with the company heretofore in Plumas county. They are industrious and self-respecting.

Gazette: The company composed of Messrs. A. G. Clough, Ed. Nordgren, Frank Thorne, John Marshal and O. F. Griffin, which recently purchased the Horseshoe mine in Hunter's valley, is pushing work ahead rapidly. Twelve men are employed in the mine and a ten-stamp mill is already in process of erection, while the new boarding house is nearly completed. It will be but a few weeks before the work of crushing ore will begin, and the ledge is reported to be rich and improving in quality as greater depth is reached.



Messrs. Austin and Brown, of Fresno, who purchased the Barn Gulch mine in the Sherlocks district a few months ago, have been working steadily on the property. A depth of seventy feet was reached this week, when very rich ore was found.

E. H. McGregor, of San Jose, amalgamator for the Whitlock mine, arrived last week and has assumed his duties there.

Nevada.

THE GOLD BANK TUNNEL.—J. R. Dickinson, who recently went to London, is reported to have succeeded in getting an English company to take a controlling interest in the stock of the Gold Bank Tunnel, and that they will put up $250,000 to put it through. The idea is to start on the South Yuba river, run under the mines on Deer creek and eventually reach Grass Valley. The distance is about four miles and the depth attained would be 2000 feet.

THE ODIN MINE.—Superintendent Hesse tells the *Transcript* that good gravel is being taken from the Odin mine. Although the gravel prospects well and occasionally pieces of coarse gold are fouud, the gravel is not from the main channel for which the company have been running so long. From the prospecting that has been done it has been demonstrated that in order to strike the channel properly it will be necessary to sink a new shaft.

SECTION THROUGH ODIN CHANNEL, HARMONY RANGE, NEVADA COUNTY.

GOING TO START AGAIN.—*Transcript:* The owners of the Boss mine, near North San Juan, have made complete arrangements to resume work on their mine next week.

STRUCK IT RICH.—S. M. Grall and H. Deniker have struck a very rich quartz ledge on what is known as the White Ranch near Montezuma hill. This section abounds in rich quartz ledges.

THE PROVIDENCE.—The Providence mine is looking better now than ever during the long term of years that it had been worked. A large shoot of splendid quartz, which was struck not long ago, is furnishing an abundance of ore and has lately increased in size and richness. Thirty-five stamps have been running in the mill for some time, and in a few days all forty will be pounding away. The remaining five stamps are now being put in working order. It is thought that quartz can be taken out of the mine fast enough to keep the mill running at its full capacity for some time. Over 100 men are employed and everything in the mine and in the mill and chlorination works is being managed carefully and systematically.

BOUGHT IT CHEAP.—*Transcript:* The Pittsburg mine and the Pittsburg Extension, together with the buildings, mill and machinery of all kinds, have been bought at constable's sale to satisfy a judgment obtained by Robert Hollaud, he buying it for $307.62.

Plumas.

MINES BONDED.—The Claybank, America and St. Louis, drift mines at La Porte, are bonded to J. H. Thomas, of Oakland.

THE HIBERNIA MINE.—Gullie and Hook have twenty-five men at work on the old Hibernia property, near Greenville, making general improvements preparatory to crushing.

San Diego.

IN THE PICACHO BASIN.—The Old Blossom mine is turning out rich ore from its 12-foot vein.

It is thought that the Ogilby district will have three more quartz mills built there this year.

The Figueros mine at Pot Holes, twelve miles above Yuma, on the Colorado, has been sold to Davis & Wetmore for $36,000. They will build a 10-stamp mill. The shaft is down 72 feet; the ore averages $19 per ton.

The old Dahlonega mine at Buena Vista is to have a 10-stamp mill. Beatty & Co. own the property.

Louis Jaeger is sinking a new shaft on his Oro Grande mine.

BANNER DISTRICT.

Stewart, Egan and Moulton, have bought the Ranchita mine. The property has been in litigation for some time but all conflicting interests have been satisfied. The mine has not been worked to any considerable extent.

C. F. Holland, of San Diego, has bought out the interest of Santillanes, Lopez, and Savoria in the Elebada mine, and is now directing operations.

San Bernardino.

SUIT BROUGHT.—Employes of the Gold Bronze mine, Vanderbilt district, have brought suit to recover $2720.50 claimed to be due for labor.

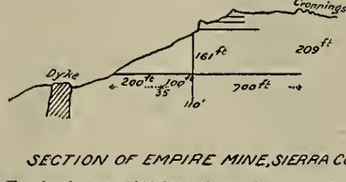
Shasta.

WORK AT IRON MOUNTAIN.—*Free Press:* Work is being pushed by the Mountain Mining company in all the different departments. They have four camps now, one of graders for the smelters, one of graders for the roadbed of their narrow-guage railroad, one of surveyors, and the big camp at the mine. They have about fifty men at work grading for the railroad, who have completed their work from Iron Mountain to the Hidden Treasure mine. We understand that the company expects the grading to be completed in three months.

Sonoma.

PAINT AND PLUMBAGO.—The paint mine near Healdsburg is being worked up to six tons milled a day. Recently while breaking ground for the foundation of the new paint mill a vein of plumbago was discovered. The find has not been developed.

Siskiyou.



The Blue Gravel mine at Greenhorn, about a mile south of Yreka, has yielded about $60,000 in all, and only 700 feet of ground partially worked at that.

Songer & Dame, of the Pacific mine, Klamath river, have engaged a new crew of 21 more men for their claim, in putting up another derrick.

Sierra.

THE EXCELSIOR CLEAN-UP.—*Democrat:* Last week's clean-up at the Excelsior mine was the largest ever had at that mine. The total output this season will reach nearly $10,000. The season was an unusually short one, they having had but about fifty day's water, and during that time with not a full head. The future outlook for this mine is very bright.

THE EMPIRE MINE.—Renewed attention is attracted to the Empire mine, the five-foot vein in shaft No. 2 showing good ore. The Empire is over 7000 feet above the sea and the difficulty of carrying supplies over a pack trail and the deep snows of the winters make progress necessarily slow.

SECTION OF EMPIRE MINE, SIERRA CO.

Trinity.

THE GILZEAN QUARTZ MINE.—Chas. Gilzean, from Deadwood, tells the *Journal* that at the Gilzean mine the lower tunnel has tapped the ledge at a depth of 35 feet, distant about 20 feet from under the pay shoot in the upper tunnel. The ledge where tapped is from 12 to 18 inches in width and is good milling ore.

Tuolumne.

ATTRACTING ATTENTION. — *Independent:* Messrs. Gorrie and Merrille, from the Anaconda Mining Co., of Butte, Montana, have been examining mines in this county the past two weeks. They have concluded to take hold of several properties which they will develop, and if found as represented, will purchase. Mr. Louis Chervillon, civil and mining engineer, from Paris, France, has been examining mines, with the view of purchase for a Frence syndicate. He was well satisfied with the properties he experted, and has reported favorably to his company, who will, under advice, probably invest in Tuolumne.

Mr. Rose, of San Francisco, and Mr. A. D. Glace, of Oakland, have both been inspecting our mining resources, with a view of investing. The above gentlemen came in the interest of the Tuolumne Mining Bureau, and more due. The Bureau are doing their utmost to bring capitalists into this county.

NEVADA.

THE COMO TUNNEL.—*Enterprise:* Work has begun on the tunnel which will drain the Como mines. The mouth of the tunnel is near the spring at Palmyra. It will be run east of north a distance of 900 feet, at which point it will intersect the ledge in Palmyra ground. The tunnel project is the conception of Colonel Boyle, superintendent of the Alta. The ledge at Como is a true fissure vein of mineralized quartz. It runs north 30° east. Near the Palmyra mine, and easily accessible to the tunnel, are the North Rapidan and Maxwell mines, owned by Colonel Boyle, and the Mt. Como and three other claims, recently bonded by an English syndicate. The Palmyra mine is also bonded hy the same syndicate. The tunnel is intended to be a key to the whole situation at Como, as the Sutro tunnel is to the Comstock.

ESMERALDA COUNTY.

INSUFFICIENT CAPACITY.—Hawthorne *Bulletin:* The mill at Douglass is not of sufficient capacity to handle one-quarter of the output, and many of the miners have large quantities of ore on the dump, waiting their turn.

LINCOLN COUNTY.

The preparatory work going on at the Summit smelter and Old Timer mine, west of Pioche, means much work for that town. The intention is to work the Old Timer, Halfmoon and probably some of the mines in the vicinity, primarily for the gold in the ores, with the lead and silver to be extracted thereafter. The cyanide process is to be used, and tanks to work ten tons a day will be placed in the Summit smelter works of the Pioche Consolidated Mining Company.

OREGON.

ACTIVITY AT SIXES.—At Salmon Mountain and Sixes there are about 150 men at work, and most of them are doing well. Sam Currier has an exceeding rich quartz claim near the Divilbiss quartz mill, and he has taken out over $1000 worth of free gold during the last month with a small mortar.

JACKSON COUNTY.

Supt. James has a small force of men at work at the Ashland mine.

The Tolo Mining Co's. effects are being sold for debt. The wood, hydraulic pipe, etc., were sold a few days since to satisfy the claim of Mr. Potter of Rock Point precinct. Reid, Milner & Co. have telegraphed from Tacoma that they will settle everything.

Ladd & Williams of Gold Hill district cleaned up $1700 the season's run at their placer mine.

Beckman & Huffer's quartz mill will be in operation next month.

Hull, Beck & Pelton of Louse creek have struck a rich body of ore in their quartz mine and bave taken out several hundred dollars.

The Lucky Bart and Rita mines in Sardine creek district are being operated with a small force, and the ore is being crushed by J. H. Breeman at the Lindley mill.

The Sterling Mining Co. have commenced cleaning bedrock and will be so employed for the next six weeks. The prospects are good for a favorable result.

N. H. Spencer of Griffin creek, who has been prospecting a graphite proposition, has run a cut of about forty feet and struck a five-foot ledge, which has the appearance of being permanent and shows a good quality of ore.

R. F. Yocum and Dr. Pearce of Poorman's creek will cut a four-mile ditch from Griffin creek this fall. It will raise the supply to enough for six months' work.

W. H. Reid of Tacoma, Wash., is straightening out the business of the Tolo Mining Co.

ALASKA.

GOLD ON THE KOWAK.—A new gold field has been found in Alaska, on the Kowak river, about 200 miles from its mouth. Three men took out $500 in two weeks in coarse gold last fall and returned there last spring.

SAYS THEY WERE DECEIVED.—G. Peterson, Seattle, Wash., recently returned from Alaska, says there are hundreds of men at the head of Cooks Inlet penniless and in danger of starvation: that Beatty, another Seattle man, narrowly escaped lynching at the hands of the miners. He took a party of ten miners to Cooks Inlet and promised that they should be paid at the rate of $30 a month. When the men got there they found the rate was $3 a day, although the employers paying it were steadily losing money and rapidly abandoning work. Beatty's men went on a strike and he let them go. Subsequently they offered to work at any price, and the return of several prospecting parties with discouraging news made the men desperate and there was considerable talk of lynching Beatty.

BRITISH COLUMBIA.

GENERAL NOTES.—Ashcroft *Journal:* Lyons and Murphy have commenced work with a gold dredge at Rusty Bar, about six miles down the river from Ashcroft.

The Ottawa Hydraulic Company at Boston Bar, below North Bend, has completed a grade of three miles, on which a flume will be laid to convey water to the mine. The machinery will be taken across the river by cable.

Between 12,000 and 14,000 pounds of dynamite went in last week to the Horse Fly mines. The cement streak for which this powder was required is getting thinner as work progresses. Fossils of an ancient typ

have encouraged Manager Hobson to believe that they are working on the true alluvial deposits.

By snowfall the Southern Kootenay will be well prospected. Hundreds of men are at work, mostly prospectors of experience.

A private letter from Barkerville states that all the men available at Barkerville are working for the Cariboo Gold Fields Company, Mr. Whittier manager, and will be till winter sets in; still it is doubtful whether it is advisable for men to go up looking for work. There is a report that the Island Mountain quartz mill will be repaired this winter to start up next summer, and also the Black Jack quartz mine. The Sheppards expect to clean up 300 or 400 ounces of gold this season on Sheep creek, at the head of Downie's pass. Mr. Newton, on Stout's gulch, half a mile from Barkerville, cleaned up 400 ounces some time ago, and it is reported that he will have 200 or 300 ounces more this season.

IDAHO.

THE SITUATION AT WARDNER.—(Special Correspondence:) The Miners' Union, that had things pretty much their own way for the past year or so, is making its last kick. The Bunker Hill and Sullivan mines are working a full complement of men and are running their large concentrator night and day. There are plenty of men to be had at $3 per day, and good miners, too. The Hunter mine at Mullan is running and has all the men that it needs, and more, too. They are paying the same wages as the Wardner mines. The Emma and Last Chance at Wardner are running, and have a good lot of miners, and can get all they need and as fast as they want them. Board and lodging at the hotels is $7 per week; at the company's boarding-house, $6 per week, bunk room free. The people who pay the taxes and support the country have become tired of being run by a lot of unreliable agitators and have quietly sat down upon them. Our governor, being a good, loyal American citizen, has spoken in plain English to the would-be leaders of men, and they have subsided because they well know that the governor means business. These agitators are the cause of the reduction of wages in this country more than any other one thing. The mine owners were willing to settle the whole controversy upon a basis of $3.00 and $3.50 for carmen and miners, but the leaders of the unions said no, it must be $3.50 all round or nothing, no matter what the price of lead or silver might be. The mine owners said, We will pay $3.00 and $3.50 a day as long as we can, and when we can't we will shut down and say nothing. The union said No! so the mine owner had just as much of a fight to make if he tried to run and pay $3.00 and $3.50 as he would at $2.50 and $3.00, so, of course, as long as it was fight, why it might as well be for an object; and at the same time, under the present prices of their product, $2.50 and $3.00 per day was better wages than was being paid anywhere else in the United States under the same conditions. The companies have agreed to raise the wages to the old scale as soon as prices of lead and silver justify it. Within the past six weeks 400 men have gone to work, and before the first of September there will probably be 200 more on the pay-rolls. There will be no trouble, and men, whether they belong to the union or not, will not be molested. This is not satisfactory to the agitators, but the majority of the members of the union and the free American citizens of the country are pleased with the present conditions, and the fact that the troubles are settled and the messenger of peace is abroad in the land tends to make everybody happy, excepting, of course, the agitator. There are directly employed in the mines about 1400 men; add to this number those employed as lumbermen, wood-choppers, teamsters, etc., and it will bring the total up to about 2000 men actually at work at the present time. This number will be gradually increased to in the neighborhood of 3000. The day of the dynamite agitator is past and he is out of a job in the Cœur d'Alenes. The people who have the welfare of the country at heart feel jubilant over the prospects of a bright future and over the fact that murder and riot are things of the past in Shoshone county. Thanks to Governor McConnell and to the law-abiding citizens of the county who have seen the right and have not been afraid to speak out without fear or favor.

Wallace, Idaho, Aug. 18th, '95.

AROUND WARDNER.—At no time in the last three years has there been such a feeling of confidence in the Cœur d'Alene country in general, and in Wardner in particular, as now. The Hunter mine has resumed operations: it is expected that the Morning mine will follow very soon. These two mines will employ about 400 men.

There are now in the employ of the Bunker Hill company over 300 men and more are coming in daily, most of them from California. The company thus far has not shipped a great deal of ore, as a large force of men has been constantly on development work. The company has ordered a large amount of machinery and is putting the mine in shape for continuous running.

At the Last Chance mine men are being put on as fast as they can be used to advantage.

MONTANA.

JEFFERSON COUNTY.

Jefferson county produced, in 1894, 8,111.464 fine ounces of gold, worth $167,678.84. During the same twelve months the county produced 765,483.04 fine ounces of silver, at a coinage value of $989,715.44, a combined precious metal output for the year of $1,157,394.28.

SOUTH DAKOTA.

THE HARNEY PEAK TIN MINE SUIT.—Dr. A. R. Le Doux, the receiver of the Harney Peak company's properties has returned from England. The American and English stockholders are as far from a settlement as the day when the latter made application to the United States Court for a receiver. Their difficulties will now be settled in court, and the case will be tried in October in New York.

DIVIDEND PAYERS. — Black Hills *Times:* There are at least twenty separate mines, exclusive of the Homestake, paying monthly dividends, ranging from $1,000 to $8,000. The mines are principally owned by private individuals, who reside in the Hills, and as a majority of them are not incorporated stock companies, no published knowledge reaches the outside world of what is actually being accomplished, as in the leading mining journals of the country we see the Homestake quoted as the only dividend paying mine in South Dakota.

GOLDEN REWARD.—*Pioneer:* Work on the Golden Reward mines, which was abandoned a few days ago on account of the superabundance of ore at the works, will be resumed some time the last of this week. The cyanide works of the company will start up on the 22d and as soon as the increased crushing capacity is ready will run continuously. At present it is impossible to crush sufficient ore for both the chlorination and cyanide plants, so that it is only when several tons of ore are crushed for the chlorination works ahead that the cyanide works can be run.

UTAH.

SOME UTAH MINES.—I. K. Clark and associates, who bonded the Stewart No. 2 at Bingham for $150,000, have put into operation a reduction plant which, it is claimed, will solve the problem of treating Bingham's low-grade gold ores. After the ore has been crushed by rock breakers and stamps it passes over copper plates, which save the free gold. The tailings are then pulverized by a patent process, in which pulverizing stones imported from Norway are used. The tailings are then treated by amalgamation.

The Ontario and Daly mines, under one management, produced during the month of July $145,000. It is a matter of uncertainty when the Ontario will resume the payment of dividends, as the great drain tunnel, which has cost millions of dollars, and which now drains the present workings, is being pushed farther into the mountain for the purpose of draining a large area of virgin ground.

Negotiations are on foot for a settlement of the difficulties of the Salt Lake Copper Plant company. The amount expended on the plant, which is now in the hands of a receiver, was $381,000, and the claims against it aggregate nearly $300,000.

TO BE SOLD.—Nephi *Times:* The Ibex smelter at Leamington is to be sold. This was ordered by Chief Justice Merritt in his decision on the report of Receiver Humphries last Tuesday. The smelter has been run at a loss ever since the Posey-Underwood syndicate took charge, and the losses have been greater since Receiver Humphries has been in possession. The plant is valued at $60,000, and the claims against it aggregate something like $80,000. Of this sum $11,100 is due the laborers at the smelter for wages.

Last Tuesday the smelter was closed down for good. Its last short run entailed a loss of about $7000. Thirty-one thousand pounds of bullion and four cars of matte went north from the smelter this week and 8000 tons of ore are on the ground at the smelter which will be a dead loss.

COLORADO.

FOUR MILLS BUSY.—The cyanide mills at Florence and the De Lamar and El Paso mills in Cripple Creek have hundreds of tons of low grade ore on their platforms waiting for treatment. Low grades, which it has not been found advisable to ship to the smelters, and ore which will grade anything above $10 can be treated at any of these mills at a fair profit.

ARIZONA.

THE OLD DOMINION.—The new owners of the Old Dominion Copper Company, have a mine which has yielded 65,000,000 pounds of copper. The present shaft is to be enlarged to a three-compartment shaft and sunk to the depth of 1000 feet. The copper bullion produced by this company as it comes from the furnaces runs, on an average, 98¼ per cent fine, which is the purest copper made in Arizona.

SILVER PROPERTIES. — Prescott *Journal-Miner:* Inquiries for silver properties in this section are on the increase, and if silver keeps up to its present price, even, it will not be long until some of the old-time silver producers will be worked again. The difference in the cost of transportation and treatment over that of a few years ago, will compensate for the depreciation in the value of the white metal, which has taken place in the same time.

C. J. Clark, of Denver, president of the Admiral Gold Mining Company, is out at the Bradshaw mountains having some work done on the Admiral lode, one of the company's claims. At a depth of 30 feet from the surface a three-foot streak of ore was encountered which assays as high as $72 per ton. In sinking 20 feet 25 tons of ore were taken out. With each foot of sinking, the quality of the ore is improving. The ore is being worked by the Liston mill. Some beautiful specimens were found, which gives every indication that the mine is another one of Old Bradshaw's treasures.

YAVAPAI COUNTY.

Courier: One thousand dollars cash was yesterday paid to John F. Osenberg for one-fourth interest in one of fourteen claims situated in the Congress mining district, the purchaser being J. F. Holden, of California. A group of three claims well developed will be bonded for ninety days, as soon as parties arrive here from California, for $35,000.

SCOTLAND.

KILDONAN GOLD MINES. — Under date of August 9th our Edinburgh correspondent writes:

The period for which the Duke of Sutherland allowed the County Council to test the Kildonan gold fields has expired. During the past few weeks the number of diggers had increased to seven, but none of them had been working under the conditions laid down at the opening of the scheme. They had been washing mostly in the bed of the Suisgill burn. One of the Helmsdale diggers, who began work when the diggings opened, has cleared up from £18 to £20 worth of gold as his three months' work. Several have made fairly good wages, but one or two have done practically nothing.

The seven diggers at work have handed to Mr. Seton, station master, Kildonan, altogether about 15 ounces. Only three or four of the men worked the whole time, and during the first few weeks they were simply prospecting in Suisgill burn and quarrying out in the parts they thought richest in the bottom of the burn. Though they have had claims of 40 square yards measured out to them, none of them have stuck to their claims, and the Dunrobin authorities refuse to recognize the experiment as satisfactory. A week or two ago they began "washing" out the "dirt" quarried, but spates stopped them at this work, and they are, therefore, to go on for some time yet until they have finished this, if they are not interdicted before that time, as they declare they are doing no harm to anything, their operations being confined strictly to the bottom of the burn. They are getting up to the work and are quite enthusiastic in declaring that now they can make good wages, and this although the apparatus they have is primitive in the extreme. The gold is of a beautiful rich color, and they expect to sell it at four guineas per ounce. Unfortunately, on Tuesday the hut which David Mackenzie, Inchture, Perthshire, an old Ballarat digger, built for himself caught fire, and all his belongings were burnt; and it was only by the concentrated efforts of the gang that the fire was put out after burning about a hundred square yards of the heather behind it. The experiment so far has only wetted the men's desire, and they much regret that they will have to give up work, which they declare has paid them well, and which was promising to yield them even better than in the past.

He adds: "The Council seem to me to have been too parsimonious, and to have lost their chance a good deal, for, instead of hiring a practical miner and giving the matter a scientific trial, they advertised for miners, who were to work at their own charges, to give up part of any gold found, and to quit at the end of three months.

"It remains to be seen whether or not the Council think this show of gold from the diggers' operations will warrant them going further into the matter, and, perhaps, leasing the ground and sluicing it."

Coast Industrial Notes.

—Oregon's coal product in 1894 was 47,521 tons; value $183,914.

—Barlow & Curtis of Tacoma will mine coal on their property at Chehalis, Wash.

—Seattle, Wash., has 169 manufacturing establishments, which employ 2288 people.

—J. B. Stetson and Lovell White head a project to construct a railroad to the top of Mount Tamalpais.

—Borings for gas and oil four miles north of Livermore, Alameda Co., indicate the existence there of large quantities of both.

—The Boca Mill Company has a contract for 1000 M. feet lumber to be used in the construction of flumes, dams, etc., for the Nevada County Electric Power Company.

—Claus Spreckels is having cleared the lot corner 3rd and Market streets, which recently cost him $306,000, on which he will erect a fifteen-story building at a cost of $500,000.

—The Consumers' Light and Power Company of Spokane, Wash., has a contract with the General Electric Company, Schenectady, N. Y., for an electric plant to cost $100,000.

—A flour milling company is now paying wheat growers in Riverside and San Diego counties about $5000 weekly for grain. Crude petroleum is being used for power in milling this grain.

—The Shore Line Bicycle Railroad Company expects to build ninety miles between here and Santa Cruz. The promotors of the road are said to have constructed a similar line on Long Island.

—The Sierra Valley Railroad Company has executed a mortgage in favor of the California Safe Deposit Company for $1,000,000 to secure a redemption of 1000 bonds at $1000 each to be issued by the company.

—The Stanislaus and San Joaquin Water Company has floated $350,000 in bonds here. A mortgage on all the property of the company was last week filed at the Recorder's office to guarantee their payment.

—The United States Circuit Court, Northern District of New York, has reversed the decision of the Board of Appraisers, which decided that cedar from British Columbia was subject to an advalorem duty of 20 per cent.

—The Board of Directors of the San Francisco and San Joaquin Valley Railroad gave contracts for 1,500,000 feet of lumber last Wednesday, to be used principally in building the bridges over the Tuolumne and Stanislaus.

—The Southern California motor road of San Bernardino has been sold to the Pacific Improvement Company for $167,100. The sale was made by the master in chancery of the United States District Court of Southern California.

—The Mexican Government is giving attention to extending its various waterways so as to develop inland navigation. General John B. Frisbie, of this city, has received a concession for an electric railway from Julopa, on the Interoceanic railway, to Coroba, in the Santa Cruz railway passage, through an extensive coffee and fruit country. Survey and construction will begin immediately. George Topham has the engineering in charge. This is the first electric railway projected in the republic.

—On October 1st the Pennsylvania, the Southern and the Southern Pacific will unite in a semi-weekly limited train service between New York and San Francisco, leaving New York on Tuesdays and Saturdays. A saving of three hours over present schedules is promised.

—The Gig Harbor lumber mill, which has long lain idle, was sold recently to the Port Blakely Mill Company. The plant originally cost $126,000 and brought $9000—an example of what the northwest country has had to meet through hard times and depression in the lumber trade.

—The King Hill Con. G. M. Co. has incorporated under the laws of West Virginia, capital stock $1,000,000. I. B. Newcomb is president, George V. Sims secretary, Rooms 32-33, Mills Building, New York. The company is organized to purchase and develop the King Hill and Golden Chariot, near Placerville, Boise county, Idaho.

—The Los Angeles Consolidated Electric Railroad was sold last Monday to Captain A. M. Payson, manager of the Pacific Rolling Mills, as representative of the holders of $1,500,000 of bonds, or one-half of the face value of the issue. There were two bids. Captain Payson had a certified check for $150,000 on the Bank of California to make the first payment.

—The Albion Lumber Company of this city recently sent a sample block of redwood to Indianapolis, Ind., accompanied by a letter asking that it be included in the material to be bid upon for the North Meridian street block pavement. The Board was favorably impressed with the sample, and decided to admit the wood in competition.

—Consul Hale at Guaymas, Mexico, informs the State Department that the consular district represented by him is in a very prosperous condition. The mines are making liberal shipments of ores and bullion. The big irrigation ditch on the Yaqui river is nearing completion. The American steamers plying between Guaymas and San Francisco are doing a good business.

—The Columbia river salmon pack aggregates 500,000 cases, of which 90 per cent is chinook. The packers and fishermen are well satisfied with the season's work. The packers estimate that they have packed at least 100,000 cases more than they have bargained to sell. The 3000 fishermen along the lower Columbia have been paid in cash $1,500,000 for raw fish in four months' time.

—The assessments for 1895 of the nine counties comprising southern California are as follows: Los Angeles county, $82,344,875; Riverside county, $12,081,322; San Bernardino county, $14,209,502; Orange county, $10,054,845; San Diego county, $23,090,144; Ventura county, $7,719,113; Santa Barbara county, $13,039,685; Kern county, $14,080,855; San Luis Obispo county, $13,787,865.

—About September 1st the largest powder blast ever exploded in southern California will be touched off at the Otay dam in San Diego county. This powder charge of over 24,000 pounds it is expected will dislodge at least 150,000 tons of rock. The dam, of which this rock will form a part, will impound 21,000,000,000 gallons of water. It is a part of the great irrigation system of the Mt. Tecarte Water Company.

—A very odd pavement is one just completed at Chino, Cal., made mostly of molasses, a refuse product of the beet sugar factory, hitherto believed to be of no value. It is mixed with sand to about the consistency of asphalt and laid like an asphalt pavement. The composition dries quickly, becomes hard, and remains so. The peculiar point of it is that the sun makes it drier and harder, instead of softening it, as might be expected. A block of the composition several feet long, a foot wide, and one inch thick, was submitted to severe tests and stood them well.

—Engineers have completed the survey of the proposed railway line that is to give Astoria, Oregon, railroad connection. The work of securing the right of way for the proposed line is well under way and in about three weeks the contract will be let for the construction work. The line, which is being built by A. B. Hammond of Missoula, together with his associates, will run from Astoria to Gobel on the south side of the Columbia river, a distance of about sixty miles. Across the river on the north side is Kalama. Here the new line will connect with the Northern Pacific, giving Astoria and the country tributary a direct line into Portland. The proposed new line when completed will cost about $2,000,000. It is expected that the work of construction will be commenced next month, and the road rushed to completion to be in readiness early next season.

—Z. S. Spaulding, a sugar planter, has made a cable proposition to the Hawaiian Government to build from San Francisco to Honolulu a branch line, to be built connecting the other islands of the group. He wants $50,000 a year for twenty years, the Government to have the right to use both systems for the transmission of official messages, free of charge, up to the sum mentioned per annum, reckoning at the regular rates charged. One clause provides for the exclusive privilege of landing cables on this territory for the term of twenty years, such privilege not to be construed, however, as conflicting with any rights the Government of the United States may possess by virtue of any existing treaty. The promoter agrees to have the cable in working order by October 31, 1898, if he is successful in obtaining subsidies from both the United States and Hawaii. The United States Congress will be asked to appropriate $100,000 a year for twenty years. The Hawaiians have accepted the proposition in a modified form.

Scientific Progress.

Light-Draft Gunboats.

Naval officials are calling attention, in view of the riotiug at Haw Sang and other places in China, to the great valne of light-draft gunboats for jnst such service as they might now be able to render if there were any available on the Asiatic station. The Min river, near which Haw Sang is situated, is very shallow and is not navigable except to old-fashioned flat-bottom stern wheelers, but there are many other Chinese rivers, and rivers of other countries with which the United States might become involved in trouble, which are navigable to vessels drawing ten or twelve feet. The Government is now having built at Newport News two gunboats drawing nine feet ten inches. These could be of service for such work. The great difficulty, as some of the naval officers point out, with all the vessels built for the United States navy is that, according to the laws under which they are constructed, they are to show a specified draft under a "normal" displacemeut. This "normal" displacement is construed by the builders as per lightest possible condition. A vessel with a "normal" displacement, for instance, of 7500 tons and a draft of twenty-one feet will, when coaled and ready for service, show a displacement of perhaps 9000 tons and a draft of twenty-three or twenty-four feet. The cruiser Columbia that, according to the law under which she was constructed, showed a displacement of 7350 tons and a draft of about twenty-two feet, on her recent trip across the Atlantic, with her coal bunkers full, had a displacement of about 8800 tons and a draft of about twenty-six feet. According to the records of the department, the Philadelphia has never been down to the "normal" displacement since her trial trip. At the nearest approach to it her coal bunkers were nearly empty. Had they been absolntely so she would have shown but twenty-three tons below her normal displacement.

"Congress," says a naval officer, "should indicate the displacement and draft of a vessel to be constructed as it would be when loaded and ready for sea. The 'normal' displacement is a fiction and an imposition."

Cans made of paper pulp are being introduced to take the place of tin cans for containing all kinds of preserved products. The occasional cases of poisoning from canned foods are due to the contents becoming tainted through the cans not being air-tight. Many millions of tin cans are used annually by canned goods factories in this country, and such cases of injury from tainted goods are comparatively rare; but because it is possible, through slight defects in the solder, or minute breaks in the cans, for such danger to result, the canners have been looking for a satisfactory substitute for tin. It is believed that this has at last been found in the paper pulp cans. They are oilproof as well as waterproof.

Recent investigations of the operations of the mind indicate that the subject under hypnotic influence is in a partial faint. The effort required to concentrate the attention on the operator or any striking object results in a reaction similar to that produced by strong emotion in "neurotic" women, except that the collapse is only partial, some of the faculties remaining active, while the operation of others is suspended. This hypothesis will account for some of the phenomena that are not accounted for by the theory that the hypnotized subject is in a condition resembling normal sleep.

Calcium Carbide, which is used to produce gas, is obtained by fusing together, in an electric furnace, quicklime and coal dust—two exceedingly cheap materials. The compound thus formed, on coming in contact with water, evolves a gas which readily burns. Steps have already been taken to produce the compound, calcium carbide, cheaply by utilizing the power at Niagara for furnishing the electric current, which is about 4000 to 5000 amperes for twelve hours. The illuminating power is considerably greater per cubic foot of gas than our present illuminants, and has been variously estimated at prices ranging from 7 to 75 cents per 1000 cubic feet.

Propelled by Electricity.

The electric-launch industry is slowly taking root in this country, the main difficulty being that of finding places at which to recharge the storage batteries, or get new supplies of chemicals if primary batteries are used. In this respect to-day the owner of an electric launch is often like a nation which has a fleet but no coaling station. In Europe the rivers are so much shorter than ours, the towns are so much closer together, and the population is so much denser that we find many places where launches are in demand and highly successful. The English Thames has a fine fleet, and the continental rivers are all dotted with such craft.

At Bergen, Norway, a regular line of electric-launch ferry has been established, with eight boats running on a five-minute schedule across the harbor. In winter, when the schedule is shortest, the boats ply from 7 A. M. to 9:30 P. M. On an average the boats cover thirty-seven miles daily and carry a total of 1800 passengers. The boats, which are twenty-five feet long, six feet eight inches beam, and made to carry eighteen passengers, are double-enders, with a screw at each end. A three-horse power motor runs each boat, and the chargiug station has a thirty-horse power dynamo. The service is efficient and popnlar. It would seem that there are places in America where such a plan could be adopted with advantage. Meantime electric launches are being put on many American artificial waters, and a fleet of six is being built for the Atlanta Exposition. One genius has fitted up a trolley line along a narrow stream, and the boats, instead of carryiug batteries, simply take current from a wire just as a trolley car does.

A new design of automatic marine fog signal has been fitted to the steamship "Duuera." The object of the apparatus is to give automatically, at the regular interval required by law in case of fog, the whistle or bell signals. On the bridge of the vessel is mounted a switch, by turning which the officer in charge can divert an electric current to either the whistle or the ship's bell, the latter, of course, being sounded if the ship is at anchor and the former when she is under way. The proper interval between the sounds is obtained by clockwork placed in the chart-house or some other convenient position. The current is generated by means of batteries, the clockwork completing the circuit at the necessary intervals, and in this way electrical energy is obtained for either striking the bell or opening the valve of the whistle. At the same time that the whistle is blown or the bell sounded a pen is brought into contact with a continuous band of paper, which is marked with divisions. As the paper is wound off at a uniform speed by the clockwork an autographic record is obtained showing when the fog signals, by bell or whistle, are sounded.

From the action of sulphuric acid on the gas of cleveite, M. Deslandres has obtained in the extreme red of the spectrum the third of the four lines in the solar spectrum that had not been found on the earth. This leaves only one permanent ray from the solar atmosphere, the green line, known as "the line of the crown," yet to be discovered in earthly substances; it probably belongs to some gas lighter than hydrogen.

Mechanical Progress.

Some Machine Shop Uses for Compressed Air.

On the erecting floors compressed air comes in for a good share of the work. Convenient cranes make it not only possible but much more satisfactory for one man to erect an engine, for instance, than if there are two or more men about it. Any piece of an ordinary-sized engine can be picked up and put in position by one man. In scraping the valve, for instance, the valve is lifted off its seat, after having been rubbed sufficiently to make its markings, and left suspended in the air while the seat is being scraped; then it is again let down for another rubbing, and so on until the job is completed.

Any one at all conversant with the work will readily appreciate what a convenient arrangement a crane of this kind can be made for this class of work. Here we come to the use of flexible shafts for drilling cylinders and drilling and tapping hubs of wheels, etc. A few years ago we used to consider that the flexible shaft was a very convenient thing for this purpose; and so it was, but its cost of maintenance, when used to produce work in large quantities, or, to be plain, when the use of the flexible shaft was changed from running it once or twice a day, at most, to constant and continual use, become considerable, and compressed air seems to come in as if made on purpose to fit the occasion.

Small engines can be run by air and made to drive drills and taps and a variety of tools far better and cheaper than by the use of the flexible shaft. There are other drills made for the use of compressed air direct without the intervention of the flexible shaft, and these answer the purpose admirably, though the small eugine plan has given the writer more satisfaction than the other.

Where electrical overhead cranes are used the air jet will be found very handy for keeping the armatures, and, in fact, the entire crane, clean. The dust can be blown off more effectively and hidden recesses can be better reached than by any manner of brushing or cleaning, no matter how carefully done.

When we reach the boiler shop the compressed air field widens materially. Indeed, it seems as if the different processes had been adapted or made to show the beauty of compressed air-driven machinery to the best advantage—punching, shearing, flanging, riveting, calking, fine-setting and beading. Each process can be better, neater and more economically accomplished by the use of compressed air than in the old way.—C. O. Heggem in Cassier's Magazine for August.

Paper Rims for Bicycles.

Paper rims will be put into bicycles next summer. First it was steel, then wood and now paper. Not tissue paper, to be sure, but paper nevertheless, and the change is to secure what seems uppermost in the minds of all the bicycle manufacturers just now—lightness of construction. And the substitution of paper for wood will not, it is claimed, sacrifice a particle of the strength of the wheel. On the contrary, the paper, after undergoing the process through which it is put, has all the strength and cuts off from one to one and a half pounds of the weight of each machine. Furthermore, it escapes the joint which is necessary in wooden rims and deprives them of some of their strength. Paper is used in the manufacture of car wheels. Why not in the manufacture of bicycle rims?

An Indiana man is the inventor of this new scheme, or of this application of the old scheme, and he is one of a company who are now establishing a factory at Laporte, Indiana, for the manufacture of wheels in which nothing but paper rims will be used. The process, as explained by one of that company, is this: Strips of ordinary express wrapping paper are put on a reel and allowed to pass slowly through a tank containing a solution which first soaks in, and when dry hardens and stiffens the paper. It takes about ten days for the solution to dry, but at the end of that time, it is claimed, a paper rim made in this way has all the strength, life and elasticity of a wooden rim. The weight is a good deal less in proportion than that of wood, and those who have experimented with the paper rims say they are destined to supplant the others. Some manufacturers have sacrificed a good deal in the way of strength to lightness. Perhaps here is a chance to lighten up the rims and add a little needed weight and strength elsewhere.

Damascus Steel.

It is stated that S. R. Dayson, of Des Moines, Iowa, is reported to have discovered a process for making steel equal in quality to the famous Damascus brand. In answer to an inquiry, Mr. Dawson writes the *American Manufacturer* as follows regarding the matter:

"With my process rolling is useless, as all manner of work can be cast direct from the crucible, ready to finish and temper as it comes from the molds, yet it does not require annealing, as it is nearly as soft as the wrought iron from which it is made. This metal cannot be injured by overheating. At the highest degree of hardness it will bend readily. It stands welding, forging and tempering far better than any high carbon steel. In fact my metal is not steel; it is really tempered wrought iron, as were the old Damascus blades. It is adapted to any purpose for which 'high tension' steel is now used. The principal feature of my process is chemical reaction, but I do not get the result by the introduction of carbon. As in the case of 'Russian iron,' analysis will not divulge my process."

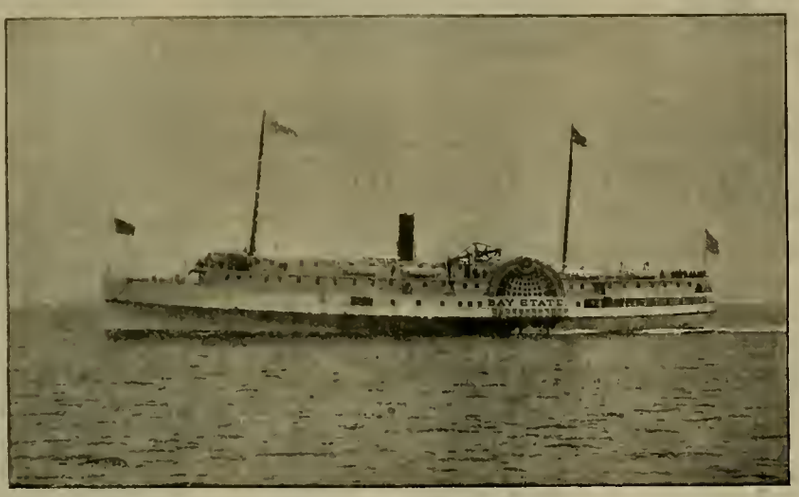
Mechanical rock drilling at Danemora, Sweden, costs, according to the *Wormlandska Annaler*, 50 cents per yard, while hand drilling is only 25 cents, so that the only advantage of machine drilling would appear to consist in the greater depth to which the holes may be drilled. At Danemora the mean depth of holes with hand drilling is two feet four inches in stopes, and two feet in conversed steps or overhand stopes, while with machine drilling the depths are five feet, and three feet and three inches respectively. In the year 1890 with hand drilling a meter shot-hole brought down 2.17 tons of rock; but in 1892 with machine drilling, 4 tons, or 3.32 tons if the subdivision of the rock masses by hand drilling be taken into consideration. Doubling the depth of the hole therefore loosened nearly double the quantity of rock, or increased by more than 50 per cent the mass of subdivided rock. In Danemora hand drilling is paid for at the rate of 25 cents per meter, without taking into consideration a small charge for setting up the 1⅛-inch chisel.

An official of the Pennsylvania railroad says that the company pays $32 per ton, and that the rails used on that line average eighty-five pounds to the yard. When it has passed its useful stage the rail is replaced. The old rails that are taken out from time to time are gathered up every month and sold to junk and scrap dealers at $12 per ton, so that the company pays only $10 for the use of rails per ton. Rails that are not much worn are sold to factories along the road at $18 per ton, where they are used for sidings. There are many uses to which the old rail is put. A great amount of barb wire fencing is made of railroad iron, and very often the rails are used as foundations for large buildings. The Masonic Temple at Chicago, the loftiest structure there, has a foundation of old rails.

To such an extent has the coal-dust bricquette of Westphalia been made and sold that the yearly output of a syndicate engaged in that business is now over 800,000 tons.

Electrical Progress.

A Triumph in Telegraphy.



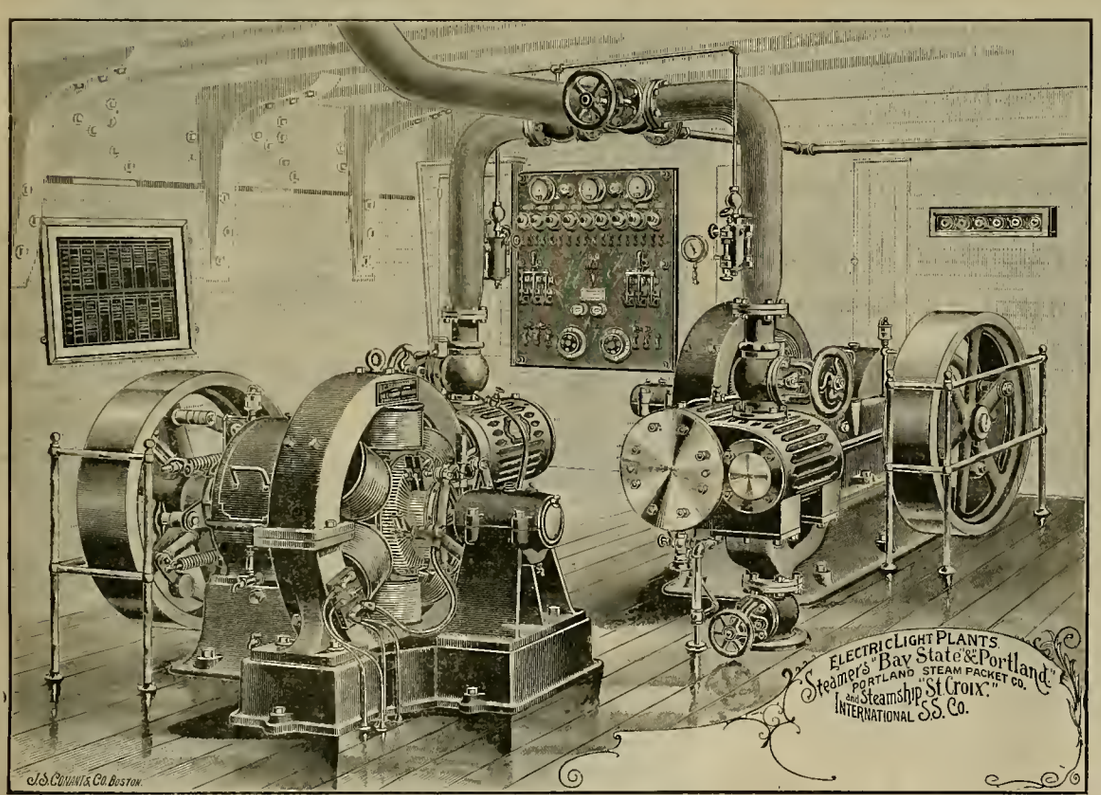
Western Union officials are elated over what they say is the success of a new invention in telegraphy. The experiments have been conducted in the private offices of the Western Union building in New York City upon the long circuit between New York and Chicago. The result of these experiments, as stated in the language of one of the officials of the Western Union Co., is this:

"We have secured the invention, which is the most advanced of anything that has been talked about in telegraphic service. We can send from New York to Chicago, in quadruplex over one wire, and have the copy produced at each end upon a printed page, and not upon a slip, 350 words a minute. I say we can do this because we have done it.

"There is no delay about it. It is not a system liable to be obstructed by delicate and impossible mechanism. It is not a fancy or a fad which can produce a result in an electrical laboratory, but be of no service in a practical operation of daily life. The invention is accomplished. It is practical. It will work. It is a practical printing telegraph which will give a result in page form like the page of a book. It is the thing that electrical inventers have been striving for since the day of telegraphy. It is the Wheatstone system very greatly modified and perfected, so that a single wire can be worked both ways and yield the result indicated. It will be some time before these machines can be put into practical operation, for a very few have as yet been made. They are still in the hands of inventors and constructors, but the scheme is perfected and the fact is accomplished."

It is understood that the Wheatstone device, which has been in use and has been owned by the Western Union Company for some years, has been greatly improved through the inventive and legal ability of a patent attorney named Buckingham, who is largely interested in the Western Union service.

The Western Union Company has made arrangements to use a newly patented typewriter machine, and an order has been given to equip the Western Union offices with this typewriter at about one-fifth the cost of the various typewriter machines, the prices of which are now regulated by a combination. Those who have given the subject attention predict that the time is not far distant when the typewriter, as well as the bicycle combination, will be broken, and when new machines, equal in the judgment of those who know them to those now on the market, will be furnished at so low a price as to be available to all. It is said that mechanical experts, who have recently investigated the cost of both typewriters and bicycles, report that the actual cost of these machines ought not to be much more than $20.



STEAMER "BAY STATE."

A COMPLETE REVOLUTION in the waterworks system of Chicago is prophesied. John P. Barrett is the discoverer of a new electrical system which, in the opinion of mechanical experts who have had opportunity to examine electrical water supply systems, will rank high in the scale of municipal utility.

Electric Light Plant on Steamer "Bay State."

Accompanying this is a cut illustrating the electric-light plant on the new steamer "Bay State," of the Portland & Boston line, recently installed by the Belknap Motor Company of Portland, Maine. The engines used are the "Ideal." The dynamos are multipolar, slow-speed machines of 400 lights capacity each, but either machine will carry the entire load which amounts to 540 lights. It has become a general practice to use duplicate plants for marine work, so in case an accident should happen to either engine or dynamo the duplicate machine can do the work. The dynamos were designed by Mr. W. H. Chapman, electrician for the company. This plant does great credit to the company, and has secured further orders for the installation of two direct coupled machines for the steamer "Portland" of the same line, also for the steamship "St. Croix" of the International Steamship Co., which is the bows of the boat. The fixtures are of the latest design with opalescent globes and shades. The dining saloon is fitted with ground glass globes, which give this part of the boat a very cheery and pleasing effect. The freight deck lights are protected with guarded fixtures.

The boat at night presents a brilliant spectacle, being a veritable floating palace and surpassing in all its appointments anything that can be found in Eastern waters, the Sound lines alone excepted. The addition of this boat has been the means of popularizing this line with the best class of the traveling public.

ELECTRIC LIGHT PLANT, STEAMER "BAY STATE."

Practical Information.

The Most Precious Metals.

We commonly think of gold as the most valuable of metals, because it is the most precious of the metals that are produced in sufficient quantity to be in common use. There are, however, several rare metals that are much more valuable than gold. Gallium, for example, is quoted at $3000 an ounce avoirdupois. Traces of it occur in some zinc ores, tons of which must be worked over in order to obtain a trifling amount. Gallium is a very remarkable substance. At an ordinary summer temperature of 86° F., it becomes like liquid mercury. The latter becomes solid at 39° below zero. Most costly of all metals, save only gallium, is germanium, which is quoted at $1125 per ounce. Rhodium is worth $112.50 per ounce; ruthenium, $90 an ounce; osmium, $26 an ounce, and palladium, $24 an ounce. The last is about equal in value to gold. These metals are of no great commercial importance. Most of them are mere curiosities of the laboratory, having been discovered originally by accident, incidental to the analysis of ores. It has been suggested that some of them might be coined, but the supply of them is too uncertain. That was the difficulty with platinum, which the Russian Government minted in the first half of the present century. Iridium is utilized to some extent for making instruments of delicacy which must have the property of not corroding. It is obtained from "iridosmin," a natural alloy of iridium, osmium, rhodium, platinum and ruthenium. This extraordinary mixture of rare metals is white.

The Dominion Parliament has voted a bonus of $80,000 per annum for twenty years to the first section of the road to Hudson bay, payments of $40,000 per annum to begin when half the section is finished, and $40,000 more when the whole is completed. This will enable the promoters to carry the road as far as the Saskatchewan river, and they assert that when they get there it will be easy to secure a considerably larger bonus for the section beyond. It is doubtful, however, if Hudson bay will ever be reached by rail, and still more doubtful if the ocean route from there to Liverpool will ever be traversed by ocean steamships.

SOLDERING "uphill," as in the case of joining a pipe while in a horizontal position, is brought about by cutting away the upper half for about six inches or more in length and working on the inside with the soldering iron till the lower portions are united, and then finish from the outside by soldering in the piece removed. This brings a whole circle within the reach of handling solder on an arc of ninety degrees.

NAVAL OFFICERS who have recently examined specimens of aluminum, which have been submitted to tests in salt water, say that the metal will not be available for use in the construction of naval vessels, because after being in salt water for a time it crumbles to pieces.

IT IS SAID that an ingenious clock has been made in Scotland that stops short at midnight every Saturday, suspends time-keeping for twenty-four hours, and then resumes.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY

BY USING

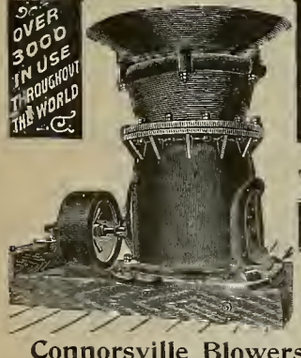
THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run. 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run. 8¾ gallons @ 14c	1 25
Coal Oil. ten hours' run. 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.



It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

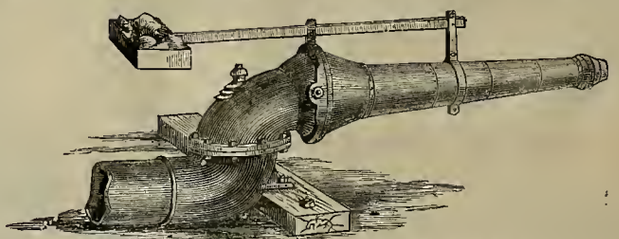
34-36 FREMONT ST., SAN FRANCISCO.
85 FRONT ST., PORTLAND, OR.

DEALERS IN MACHINERY, OILS, MINING AND MILL SUPPLIES, ETC.

Merralls' Hydraulic Quartz Mill

Superior to any other Wet Mill now in existence.



A PLAIN, CHEAP, PRACTICAL MACHINE

That will pay for itself in a short time by its very high percentage of gold saving.

W. A. MERRALLS, Inventor and Owner,

Room 12, Third Floor, Mills Building ..... San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 22, 1895.

The upward tendency in all metals continues, copper being the most noticeable. Jas. Lewis & Son, of Liverpool, England, say of copper: "Values with us are still considerably below those ruling in New York, and shipments from hence to the United States may soon be made. We are advised that the consumption in the United States is quite phenomenal at present. Shipments to Europe for the next two months are expected to be very small and confined to sales made some time ago, efforts to cancel some of these sales being made. Should this prove to be the case, a further considerable advance in values on this side appears almost certain. For English refined copper there has been an active demand, and nearly all producers are well sold forward, many of them having now withdrawn from the market. Consumers' stocks are believed to be exceptionally small."

The production of copper in the United States during June was 12,741 tons, a decrease of 2119 tons compared with the previous month. The U. S. Geological Survey reports the production of copper from American ores for the calendar year 1894 at 360,844,218 pounds. The report states that there were no notable discoveries of new deposits the past year, and no indications of a sudden addition of consequence to producing capacities.

New York Metal Market.

NEW YORK, Aug. 22.—PIG IRON—Southern, 11@14c; Northern, 12@14c.

COPPER—Brokers', 11.80@11.90c; exchange, 12.20@12.25c.

Mining Share Market.

SAN FRANCISCO, August 22, 1895.

There was a drop in prices during the week, with a slight rally yesterday, the Gold Hill stocks showing the most strength.

The San Francisco Stock Exchange voted down a resolution to allow the public access to the floors between 11:30 A. M and 12 M. and 3:30 and 4 P. M. These are matters that regulate themselves. A rule long in disuse has been recently enforced prohibiting dealers outside the railing from buying and selling stocks on their own account without first consulting a broker.

The directors of the Ophir have appointed Messrs. Lyman and Messer a committee to examine and report upon the advisability of buying the Concordia Mining property on the Brunswick lode.

The Con. California and Virginia is about to resume work on the 1000 and 1100-foot levels, north of the old shaft. The Morgan mill will soon resume crushing ore.

The following illustrates the changes of the week:

THE belief that the shallower parts of the bottom of the eastern Atlantic are parts of a submerged continent once joined to the American mainland seems to be growing. A writer in the *Westminster Review* says that the scientific evidence in support of Plato's story of a lost Atlantis has recently multiplied a hundredfold.

THE great coal strike in western Pennsylvania has been averted. The miners have secured a slight advance of wages to date from October 1. The operators had intended to postpone any readjustment until November 1.

OWING to the settlement of the trouble in Pennsylvania the outlook in the West Virginia, Ohio, Indiana and Illiuois mining regions is more peaceful. The Michigan iron miners are still out, however.

Compressed Air Transmission Six and One-half Miles Long.

TO THE EDITOR:—The Fulton Engineering and Shipbuilding Works, of this city, are extremely busy with a number of important contracts involving the use of compressed air, which should be interesting to mine owners.

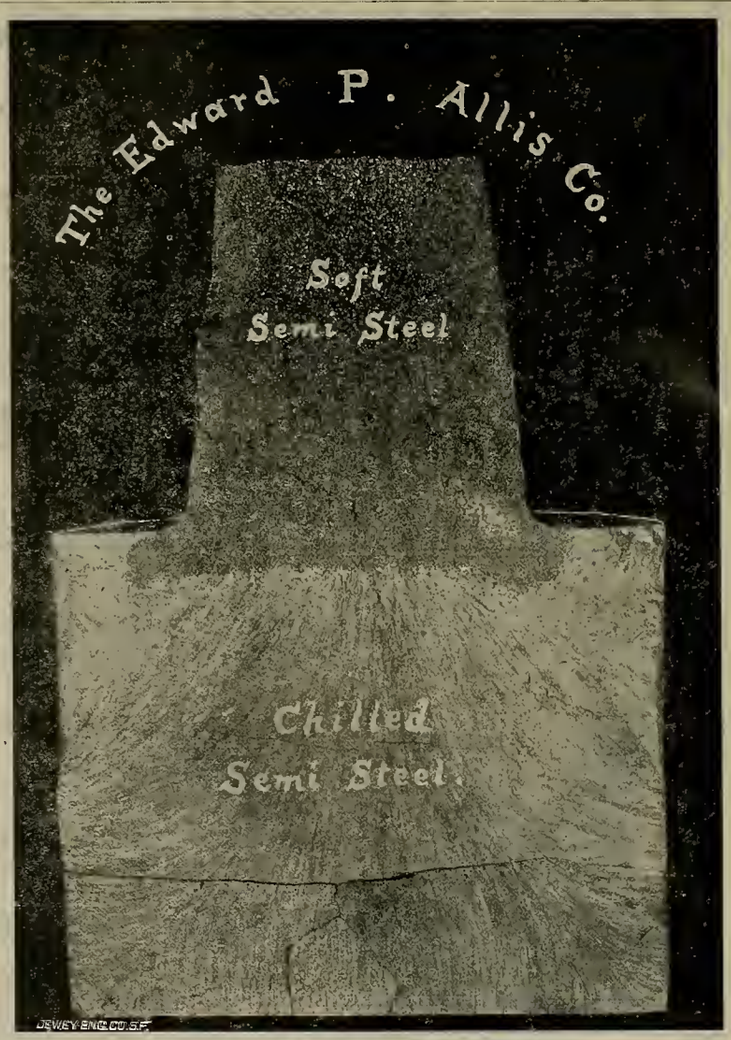
Contracts have just been signed for a compressed air transmission six and one-half miles long, from Towles Station, on the line of the C. P. R. R., to the Pioneer mine, in Humbug canyon, which Mr. Fair and Mr. Davis have recently sold to a syndicate of Boston capitalists. The air will be compressed in a duplex tandem compound Rix air compressor, by means of a 14-foot Pelton water wheel, directly on the compressor shaft. The initial pressure will be about 100 pounds. The air will then be carried through iron tubing six and one-half miles to the Pioneer mill, where it will pass into a reheater and be heated to 350 degrees. From this reheater it will pass into a pneumatic motor, Corliss type, of about 100 H. P., to run the mill, and also be carried about 1000 feet away to operate a system of rock-breakers, and also carried into the mine to operate eight or ten rock drills.

The tubing will be laid capable of carrying 450 H. P., the initial plant being for 225 H. P. It is expected that the I. H. P. in the air compressors will be realized in the motors, or very nearly so, which would make the efficiency of the transmission about ninety per cent, not taking into consideration the fuel used to reheat the air.

This plant will afford an opportunity for a direct comparison with electrical transmissions, both as to economy and general utility for general mining purposes.

A contract has also recently been signed with the North Star Co., of Grass Valley, for a Rix compound direct-acting pneumatic hoist of the Corliss type.

This same company has also contracted with the Dow Pump Works, of this city, for a compound pneumatic sinking pump.



It is interesting to note in this connection that this mine will now possess a complete outfit of the very highest class of pneumatic machinery. It is very seldom that a builder has an opportunity to finish up a plant in so complete a manner with entirely new and modern machines. In the first place, the head of water is 750 feet, brought to the water wheel in a large pipe, which furnishes an economical water supply. The water is impinged against a Pelton water wheel 18 feet 6 inches in diameter, constructed especially for this compressor, and is situated on its main shaft, thus avoiding all losses by transmission gearing. The compressor is a duplex tandem compound of 200 H. P., with intercoolers located in the wheel pit, where the temperature of the air will be reduced to that of the water. The air is conducted through a large pipe to the mine, which is not over 1500 feet distant. It is there heated to 350 degrees before entering either the hoisting engines or the compound sinking pump. In the hoisting engines, after passing the initial cylinder, it is taken back to the reheater at a pressure of about 25 pounds, and heated again before it is used in the compound cylinder from which it is exhausted at one pound and a half pressure. The expansion is therefore almost complete.

The hoisting engines will be of modern pattern and very economical. It is calculated that the economy of this transmission will not be less than ninety-five per cent, without taking into consideration the fuel for reheating the air. In other words, the 200 I. H. P. in the air compressor cyliuders will be developed fully in the motors at the mine.

This plant will be a typical compressed air plant, and if the anticipations of its builders are realized will materially encourage people in the use of compressed air for similar purposes.

E. A. RIX.

San Francisco, August 21, '95.

"Semi-Steel" Shoes and Dies.

The cut represented is a cross-section view of a "semi-steel" stamp shoe, after having been broken with a powerful trip hammer. The Edw. P. Allis Co., of Milwaukee, have lately added this production to their large list of miuing machinery, and, having been thoroughly tested in this and other States, the makers believe they have a shoe and die it will pay miners and millmen to investigate.

The ideal stamp shoe is one having a hard, durable, flawless and penetrating chilled wearing surface, and a soft, tough-texture, non-breakable neck. Such a shoe will give the greatest amount of wear and still be free of any tendency to fracture. Through long experience in the casting of chilled iron and steel for other purposes the manufacturers have become expert in castings of this description.

The "semi-steel" shoes and dies are made under a patented process and have all the properties of the ideal shoe and die, and are considered equal, if not superior, to any manufactured, at the same time much lower in price. Orders are solicited for a trial lot, and the makers feel confident of demonstrating their claims. Address all communications to the Edw. P. Allis Co. branch office, 9 Fremont St., San Francisco.

MINING SHAREHOLDERS' DIRECTORY.

List of U. S. Patents for Pacific Coast inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 13, 1895.

544,525.—PAPER CAN—G. H. Bartlett, S. F.

541,125.—FLOOD GATE—Bruce & Van Buskirk, Lodi, Cal.

544,349.—SHOELACE FASTENER—Kate Burgin, S. F.

541,131.—BERRY PACKAGE—S. W. Funk, Glendora, Cal.

541,111.—HAND DRILL.—H. D. Laufair, Westminster, Cal.

541,313.—HINGE—R. G. McClellan, S. F.

541,586.—TOILET-PAPER HOLDER—W. L. Pattalna, Alameda, Cal.

541,517.—GUNPOWDER—W. C. Peyton, Santa Cruz, Cal.

541,508.—CAR COUPLING—Sparks & Collins, Mt. Vernon, Wash.

541,521.—BICYCLE NAME PLATE—C. W. Vosmer, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LANTERN.—Emil H. Kennedy, Oakland, Cal., and Wm. Mathews, of Alameda, Cal., said Mathews assignor to said Kennedy. No. 543,691. Dated July 30, 1895. This invention relates to that class of lanterns in which an ordinary lamp chimney is adapted to be readily lifted to and removed from a candlestick base. The lantern is composed of a base; a chimney resting on said base; a swinging frame exterior to the chimney and having a top bar passing over the chimney top and spring sides; a bail or handle connected with said frame, whereby it is manipulated; and a spring under the base having projecting ends with eyes, with which the ends of the spring sides of the frame removably engage, whereby the frame may be readily detached from the base. There is thus provided a simple, cheap and effective lantern, adapted to be easily lighted and extinguished, and the base of which may at any time be disconnected and used as an ordinary candlestick.

HAIR CLIPPER.—F. Baugerter, San Francisco, Cal., assignor to Chas. H. Green, same place. No. 543,668. Dated July 30, 1895. The object of this invention is to provide a hair-clipping machine having a hinge connection between the cutter head and the handles, and a mechanism whereby the cutter may be actuated from the handles in whatever position it may stand with relation to them. It consists of a stationary comb plate having upwardly extending standards; a movable cutter plate having a recessed rear end, with outwardly extending arms; a cap plate, the front edge of which curves downwardly to rest upon the movable plate; a pair of pivoted handles, each having extensions below its pivotal connection, one of said extensions being pivotally mounted upon a horizontal axis between the standards from the stationary plate, and the other located between the rear extending arms of the movable plate, said arms being curved so that the handle extension will always be in position between them in whatever position the parts may stand with relation to each other.

GAME APPARATUS.—John Q. Brown Jr., San Francisco, Cal. No. 543,722. Dated July 30, 1895. This invention is a device or game representing a trial in court. It consists of a board or chart subdivided into a number of series, comprising each a number of sections, each numbered from first to last, and other unnumbered sections marked upon the board in suitable relation with the series in combination with cards marked and designated to correspond with the different series and sections.

DEVICE FOR HANDLING HEAVY PROJECTILES.—Theodore Forssell, Vallejo, Cal. No. 543,728. Dated July 30, 1895. This invention relates to a device for handling projectiles and ammunition, especially adapted to be used in connection with the heavy ordnance on board vessels and in other places. It consists of a two-part metal band adapted to clasp the projectile, said band having the free end of its sections slotted, the free end of one section adapted to receive the corresponding end of the other section to bring the slots into coincidence; a rigid supplemental eye; a key passing through said slots to unite the free ends, and a hoisting device adapted to engage the supplemental eye to suspend and transport the projectile.

ADVERTISING CASTOR.—C. E. Larrabee, Berkeley, Cal. No. 543,938. Dated Aug. 6, 1895. This invention relates to table castors, and it consists of a base for the reception of the castor bottles, an upright frame rising from said base having the upper portion so constructed as to hold and display advertising cards or sheets, the frame being surmounted by a shelf upon which to place napkins, and having disposed upon it convenient receptacles for containing articles, such as toothpicks.

LUBRICATOR.—James Janda, Korbel, Cal. No. 544,040. Dated Aug. 6, 1895. This invention relates to lubricators such as are adapted for the oiling of moving bearings like cranks, in which a suitable wiper in communication or connection with the bearing or journal is mounted upon the connecting rod or moving part and is adapted as it moves past the outlet of a drip cup to wipe off or receive the drop of oil therefrom and convey it to the part to be oiled. It consists of a cup or vessel secured to the moving part, having a tube or pipe in communication with the bearing or journal to be oiled, said cup or vessel having an open top and containing absorbent material leading to the bearing or journal and adapted to be reached by the discharge tube of the drip cup whenever it passes said tube, so that oil will be taken from the drip cup by the absorbent material and gradually conveyed to the part to be lubricated.

VOTING MACHINE.—S. Ducas, San Francisco, Cal. No. 544,218. Dated Aug. 6, 1895. This invention relates to a machine by which votes may be cast and registered. It consists of a table or surface containing the names of the candidates to be voted for, movable spindles corresponding with each of the names and capable of being depressed by the voter, punches attached to each of the spindles and movable therewith, a roll or sheet coiled upon a drum having the names or numbers of all the candidates written at one side and corresponding in position with the respective spindles, and names which are indicated upon the table so that the depression of any spindle will actuate the punch and perforate the sheet at a point corresponding with the name of the candidate to which the spindle is appropriated. In conjunction with this is a mechanism consisting of ratchet wheels with advancing and holding pawls, stop pins fixed to the ratchet wheels adapted to arrest their movement when the full number of candidates for any office have been voted for and connecting devices so disposed with relation to the spindles that they will be actuated by the depression of any of the spindles corresponding to the number of candidates for that office, and a mechanism connected with these devices and with the advancing pawls of the ratchet wheels whereby the latter will be rotated and advanced a tooth for the depression of each spindle until the full number have been voted, and the arresting stop prevents further movement of the ratchet wheel.

Sampling Works for Sale.

The works are situated at Daggett, Cal., in the Calico Mining District, and on side track of the Atlantic & Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power Boiler, with Ore-crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to JOHN H. GILLESPY, 1906 Stockton St., San Francisco.

Assessment Notices.

KENTUCK CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of August, 1895, an assessment (No. 11) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of September, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the first day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

AUG WATERMAN, Secretary.

Office—Room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. A. and M. E. Schofield, in the King Sayre Mine, near Gibsonville, Sierra Co., to impound tailings in Whiskey Creek; from N. B. Willlis and B Pride, in the Willow Placer Mine, near Sierra City, Sierra Co., to impound tailings on flat ground; from Oliver F. Cayn and W. T. Sherman, in the Canada Mine, near Port Wine, Sierra Co., to impound tailings in French Ravine, from H. H. and A. A. Moyer and John Costa, in the Argentine Mine, near Downieville, Sierra Co., to impound tailings in a dry ravine; and from John Pascoe, in the Eureka Hydraulic Mine, near Placerville, El Dorado Co., to impound tailings in Chili Ravine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Sept. 2d, 1895, at 1:30 P. M.

RUPTURE CURED!

NO DANGER. NO OPERATION. NO PAIN.
No Detention from Business.
QUICKLY! PERFECTLY! PERMANENTLY!

NO PAY UNTIL CURED.

J. C. ANTHONY, M. D.,
San Francisco Offices, Suite 86 and 87, Chronicle Building.

MICHIGAN MINING SCHOOL, Houghton, Mich. A high grade technical school. Practical work. Elective System. Summer courses. Gives degrees of S. B., E. M. and Ph.D. Laboratories, Shops, Mill, etc., well equipped. For catalogues write to the Sec'y. M. E. WADSWORTH, Ph.D., Director.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 25) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

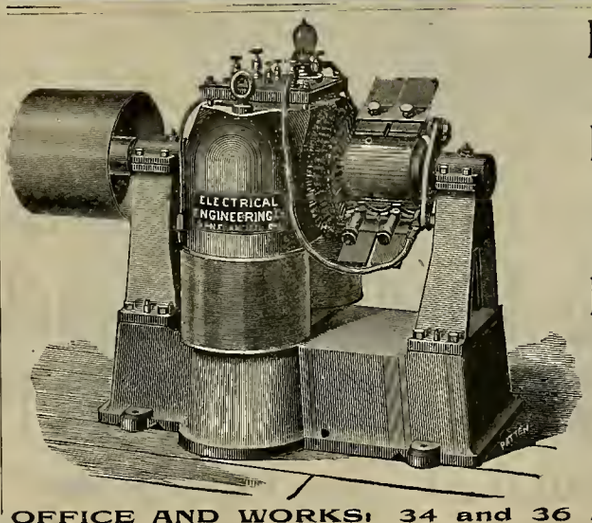
And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

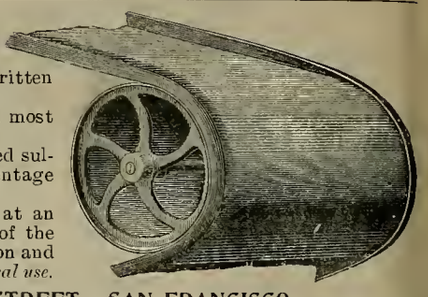


WANTED SITUATION AS BOOKKEEPER and Assayer in mine. A 1 references. Communications confidential. Address X. Y. Z., This Office.

Power, Mining, Milling, Smelting, Concentration and Leaching Machinery; Return Tubular and Water Tube Boilers, Corliss Engines, Jones' Mechanical Stokers, Hoisting Engines, Riedler Air and Gas Compressors, Riedler Pumping and Blowing Engines, Cornish Pumps, Roots Blowers, Copper Converters, Pyritic Smelters, Horseshoe Roasting Furnaces, Comet Crushers, Crushing Rolls, Stamp Mills, Shoes, Dies, Perforated Metals, Sectional Machinery, Huntington Mills, Frue Vanners, Bridgman Samplers, Concrete Mixers, Heavy Machinery and Mine Supplies. = = Write for Catalogues

FRASER & CHALMERS
CHICAGO, ILL., U. S. A. and
43 Threadneedle St., E. C., London, Eng.

Our facilities for the manufacture of heavy plate steel work, cylinders to withstand heavy pressures, etc., are especially good. We desire to bid on work in any of our lines, and will give information promptly and cheerfully, and quote as low figures as consistent with first-class work. We think we can meet your ideas both in quality and price.



Works at Chicago, Ill., U. S. A., and Erith, Kent, Eng.
Branch Offices: 2 Wall St., New York; City of Mexico, Mex.; 527 17th St., Denver, Colo.; Helena, Montana; Salt Lake City, Utah.

Electrical Engineering Co.,
MANUFACTURERS OF
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.
Electric Power Apparatus
FOR
Quartz Mills, Hoisting, Pumping, Drilling,
And all Mining Work where Long Distance Transmission is required

OFFICE AND WORKS: 34 and 36 Main Street, San Francisco, Cal.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

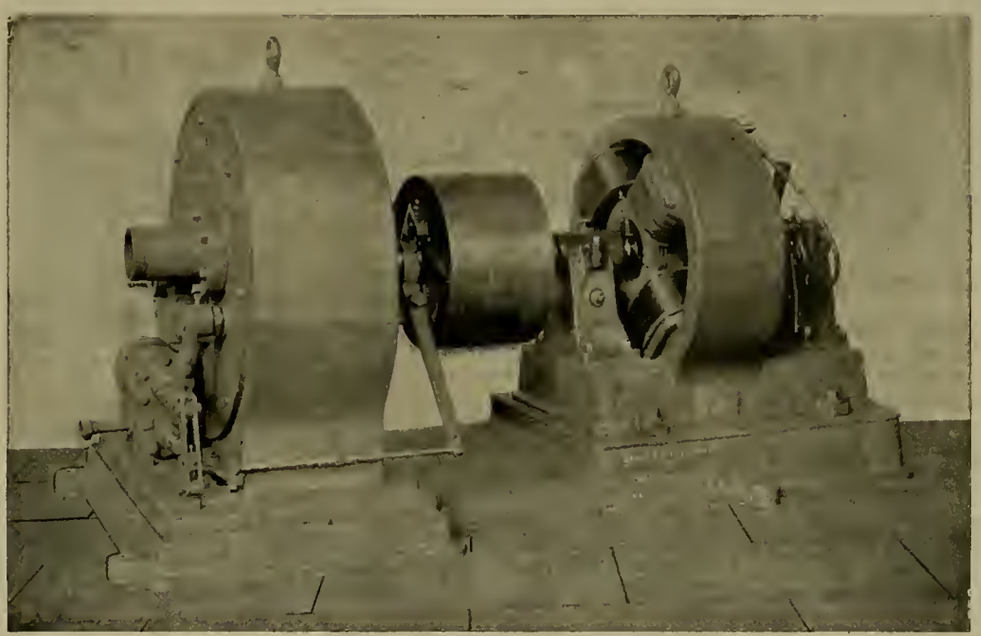
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 9.

SAN FRANCISCO, SATURDAY, AUGUST 31, 1895.

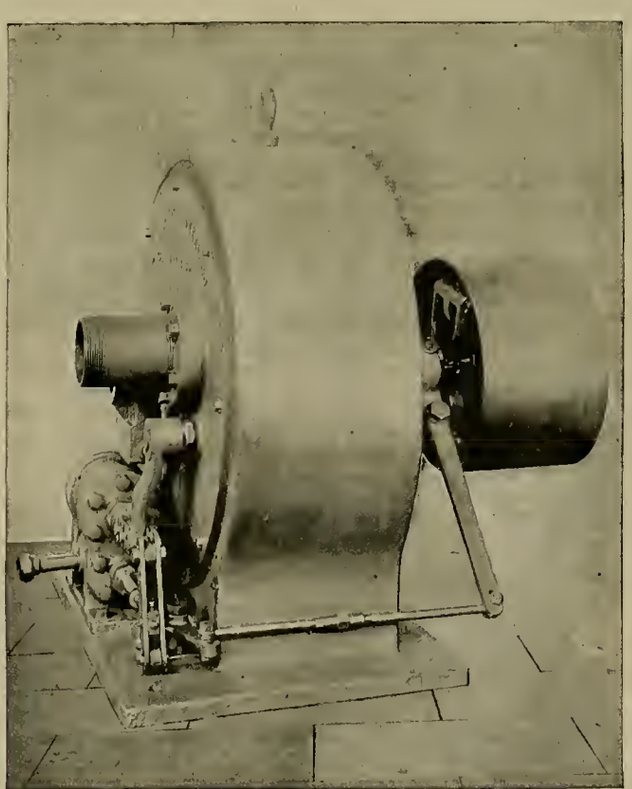
THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Girard Water Motor and Dynamo.



The Girard Water Wheel Co., in conjunction with the electrical Engineering Co., recently completed and shipped to the North Star mine, at Grass Valley, Cal., the water motor and dynamo shown in the illustration. The machines are direct connected and mounted on the same bed plate, making a complete and compact plant for electric lighting.

The water motor is 16½ inches in diameter, with simple contracting nozzle of sufficient size to develop the power required by a 100-light dynamo. The head is 750 feet and the speed 1400 revolutions per minute.



The S. & V. inertia governor is partially shown inside of the pulley which acts as a covering for it. The indications of the governor are transferred through levers to the balanced valve, which controls the admission of water to the hydraulic cylinder operating the nozzle. The construction of the governor is such that there can be no variation between the work of the dynamo and the power on the motor without a change in the cylinder, and the connections are so close and the movements so rapid that the nozzle area is altered immediately after the change takes place and before the inertia of the moving parts allows the speed to vary.

The water to supply the cylinder is taken from the upper side of the gate, and is passed through a self-cleaning strainer to remove obstructions.

The dynamo is of the multi-polar type, *D*, with large self-oiling bearings, which is the type the Electrical Engineering Company has been making for the past six or eight months.

GIRARD WATER MOTOR AND DYNAMO, DIRECT CONNECTED.

GIRARD WATER MOTOR 16½ INCHES IN DIAMETER.

Sacramento sends invitation to attend the electrical display in the State capital city on the 9th of next month, when will be fittingly celebrated the successful Folsom electrical power transmission on the 45th anniversary of California's statehood. 'Tis such events that indicate the world's progress. The telegraph and steam engine have almost annihilated time and space; California fresh fruit is eaten in London; Oregon salmon is on store shelves in South Africa, and Washington fir in the Johannesburg mines; the big world has shrank, and the Antipodes are 'round-the-corner neighbors. And now in these sunset years of the century is being discovered how needless the fear of coal mines being exhausted in the new utilization of electricity, thus one step nearer the primal source of all power—the sun. With coal the stored up sunshine of primitive ages is set free; with electric transmission the water that the sun lifted generates by gravity force as it seeks its original level—one step nearer to the ultimate result when discarding the demonstration of power by means of long buried sunlight, or by the force of returning water flow the great central day star itself will be made the primal direct source of motion and power. These are rushing times, and a generation that can harness Niagara and transmit power in the manner shown at Sacramento has much to be industrially proud of, but science points onward to where greater achievements will be to even present advancement as the first herald of day dawn is to the splendor of noon.

On the 18th of last April, in the case of W. J. Sweeney, in the Helena, Montana, land office, who there applied for U. S. patents to seven contiguous lode claims, the application was rejected by Hoke Smith, Secretary of the Interior, who wrote the Helena land office that "the total amount returned by the Surveyor as the value of the improvements is but $3305, whereas for the seven claims it should be the full amount of $3500." The application was rejected. The U. S. Surveyor-General of Utah issued a circular to his deputy mineral surveyors that improvements or work to the amount of $500 must be certified to in the application for a patent to any mining claim, whether consolidated or separate. A question having been raised, he wrote to the General Land Office on the 1st inst., asking whether such construction was correct. On the 13th E. F. Best, acting commissioner, replied to the Utah Survey-General's inquiry, telling him that the circular he had issued to his deputy mineral surveyors should be recalled, and says "the proof should show an expenditure of $500 on each claim, except it be shown that $500 worth of improvements on any of such claims is for the common benefit of all."

H. S. Durden, secretary of the Board of Trustees of the State Mining Bureau, recently wrote to the State Attorney-General regarding collection of taxes for the maintenance of the State Mining Bureau, directing attention to the act creating the Mining Bureau and providing for its maintenance. The Attorney-General replies that in his opinion the law is still in force and effect, and should be complied with by the tax collectors of the various counties, and suggests that the Trustees of the Bureau notify the tax collectors that the law is still in force.

The offer of the Union Iron Works to furnish sixty men to speed the Olympia across the Pacific was not accepted by the navy department and that swift vessel will make the trip to Japan at the ordinary moderate pace usual to vessels of the navy.

Power Transmission by Compressed Air, 146. Notices of Recent Patents, 147.

The Comstock Mining Situation.

The visit of Franklin Leouard, president of the Comstock Tunnel Co., to the Comstock mines has attracted attention. The company proposes putting its properties in better condition, hesides pushing work. Following Mr. Leonard came Senator J. P. Jones, his first visit to the Comstock mines for over five years. John W. Mackay has also arrived, being joined by D. O. Mills. The presence of these men and others interested in the Comstock, has been interpreted to mean the formulating of a plan to give that district renewed life. Whether this expectation, so far as a large-sized mining share deal is concerned, will be realized will be questioned, unless the work now being pushed in several of the mines develops larger deposits of high-grade ore than have as yet been made public. The Commission appointed by President Grant, under act of Congress, to examine and report on the Sutro (now Comstock) Tunnel, composed of distinguished and disinterested army and civil engineers, stated that "for a distance of five miles, with a varying width of from fifty to five hundred feet aud to an unexplored depth, the Comstock lode is found to be one of the richest, most productive and extensive in the records of mining. The Commissioners' researches convince them that the Comstock is a true fissure vein and cannot he exhausted by the work of man." That report was made Novemher 30, 1871.

Regarding the low-grade ore — principally gold bearing—on the Comstock the Commission reported that according to the testimony of some witnesses the amount ran up into millions of tons, ranging in value from $10 to $35 a ton. They stated that Col. Requa, superintendent of the Chollar-Potosi mine (now Chollar and Potosi mines), "in his various reports mentions the large amount of ores found that at some future time may be made available to the owners, hut which at that time could not be made available owing to the high cost of labor, transportation and reduction. He stated personally that very large bodies of $16 ore exist in the mine." The report further states "that a former superintendent of the Empire and Imperial mine (now Consolidated Imperial) stated that while in charge of that mine he struck a body of ore that assayed $19 per ton, which would not then pay to extract and mill. This body was prospected in the middle of lode more than oue hundred feet wide, to a depth of only six feet. How large this body of ore may be he was unable to say." The report then refers to a large hody of $20 ore in Ophir and also a large body of the same grade on the 200-foot level of Crown Point, and closes as follows: "From our observation, and the evidence of others, we do not hesitate in stating that vast amounts of what are designated as low-grade ores abound in these mines, that may yet be made available in increasing the national wealth."

From the time the above report was given out to within a year or so ago the mining companies have kept on hunting for "hig honanzas" and passed hy nearly all the low-grade ore. Coming to more recent years, we find that in the suit against the late Gov. Stevenson hy shareholders in the Kentuck Mining Co., it was brought out under cross-examination of the defendant that on the 1300-foot level of that mine they ran a crosscut through to gold-bearing ore assaying ahout $14 per ton. It had a width of over thirty-five feet. This same grade of ore is known to exist on the upper level of that mine, while in the adjoining mine (Crown Point) they are extracting from around the 700-foot level gold-bearing ore which mills over nine dollars a ton. This ore the company had reduced at two dollars a ton, flat, while they got a rehate of thirty-five cents a ton on the regular transportation charges of one dollar. At two dollars a ton for milling the gold ore the mill owners make a fair profit and it allows the mining company to meet all current expenses while engaged in very extensive exploiting work. Were it not for the latter work a handsome balance would be left each month; even as it is, it is expected that the hullion output from uow on will slightly exceed all expenditures, while the exploitation work under way is liable to strike an important body of high-grade ore.

There is in the Comstock lode large quantities of low-grade ore, mostly free-milling, and it is argued that, lying to the west, there is a lode of high-grade, gold-bearing ore; hut sufficient depth has not been made in it to demonstrate its character as to permanency downward. So far as it has been followed down or tapped by west workings in some of the miues, this lode has all the peculiar characteristics of a true-fissure vein. In the old workings west of the Comstock lode proper, it was followed down at several places to a depth of several hundred feet, but water and other obstacles interfered and work was abandoned. This high-grade, gold-bearing lode was found in the old Cole Mining Co.'s ground, Burning Moscow, Crœsus and other mines located to the west. Work in that direction down on the upper levels of Ophir, Con. Virginia, Alpha, Yellow Jacket, Confidence, Challenge, Con. Imperial, Belcher, Crown Point, Kentuck and others indicated that the west lode parallels the Comstock; and though not likely to have bonanzas or big pockets of ore, yet is considered a uniform bearer of ore milling from $40 upwards. It has been found to dip westward, whereas the Comstock dips eastward. In the Yellow Jacket, on the 550-foot level, a west cross-drift was run about five years ago that struck high-grade ore at a very considerable distance in, and which at the time was said to he the west or gold-bearing lode. Nothing has been heard from it since. At about the same time a west cross-drift from the 450-foot level in Alpha ran through ore of varying thickness, but aggregating over forty feet wide, which averaged over $60 per ton. This may be accidentally rediscovered later on. More recently, West Con. Virginia has pushed a cross-drift west on the 1100-foot level of Con. Virginia over 1400 feet, and is now waiting preparatory and necessary work so as to resume the westward continuation. At the time work was suspended, the formation of the rock and everything else encouraged the belief that they were close to the west lode. This cross-drift will drain that part of the district to a depth of over 1600 feet and admit of downward work being done from above. Gould & Curry is driving a west cross-drift from the 200-foot level which is in over 1500 feet. Bullion has a west cross-drift in over 1400 feet started from the 820-foot level. Work, it is expected, will he started before long hy the Comstock Tunnel Co. in connection with the mines located in American Flat to drain that end of the lode. The Tunnel Co. will, it is expected, inaugurate other important work during the coming year.

Besides the work noted ahove, important work is under way in the Gold Hill group of mines, which will lead up to more activity and a larger bullion output in the different mines, from Con. Imperial to Overman. This work is being done chiefly by Confidence, Challenge, Yellow Jacket, Kentuck, Crown Point, Belcher, Seg. Belcher and Overman. In Crown Point and Belcher the work is heing pushed west, to more thoroughly explore those two mines from the 600-foot level down to the 800-foot level. This is heing done for the purpose of striking the downward continuation of the high-grade gold-bearing ore found to the west on the 400-foot level. Referring to the ore found in Crown Point, P. W. Ames, former secretary of the Tunnel Co., wrote officially under date of July 19, 1887, as follows: "The new ore body in the Crown Poiut mine is an important one not only for that company but for the whole Comstock lode, and of course incidentally for us. This ore body was opened on the 400-foot level and is situated about southwest from their old shaft, but it is 400 feet west of their former working and 200 feet west of any point previously worked. Where the stopes are now beginning the ore body has been followed from 140 to 150 feet and shows a width of about 60 feet, of which 45 to 50 feet is good ore, going $40 per ton. On the 500-foot level a drift is being run to strike the vein, and a winze is down from the 400-foot level already about 70 feet and still in ore." While Mr. Ames reported the ore assaying $40, private advices stated that it was not only higher but was about all gold. The Crown Point Company, according to the official letter filed last week, have started a west cross-drift on the 600-foot level with the ostensible object of exploring the grouud to the west of the low-grade ore being extracted on the 700-foot level, and incidentally to make better air connection. It is believed that when this work is pushed to the west the downward continuatiou of the ore fouud ahove will be run into. This followed through discoveries to the west by the work to he pushed in Belcher will give to the Gold Hill group of mines greater life and activity than known since bonanza days, which will have an important bearing on all the mines in that district.

In connection with the above, it is in place to state that Mr. Lyman, superintendent of the Con. Virginia-California mine, is perfecting plans to exploit that mine in a northwesterly direction from the old shaft on the 1000-foot level. The object is to find if an accidental discovery made hy Mr. Tangerman, superintendent of the West Con. Virginia-California mine, at about 145 feet in the north drift ran from the old shaft on the 1100-foot level, does not make into something of great importance. By miniug men who have given consideration to the new find, it is believed to be the bottom of an ore hody. The formation and all indications seem to warrant this couclusion; hut as to its size or whether it will justify working will of course not he known until proper work has been done after connection is made between the 1000-foot and 1100-foot levels. In this part of Con. Virginia's ground there has not heen any work above the latter level, and therefore the finding of an ore body is among the probabilities when active exploiting is under way. This opinion is strengthened from the peculiar characteristics of the Comstock lode. Recognized authorities writing on this lode say that most of the ore hodies which have hitherto been discovered are situated in the east fissure. From the very nature of the case, and which was discussed in a former issue of the MINING AND SCIENTIFIC PRESS, this opening must have been exceedingly irregular. Ahove it lay only the sheltered edge of the east country, approximately retaining its position only hy gravity, while the mass of the east and west country was in motion. The deposition of ore in this fissure was no doubt dependent upon the disposition of openings which may have heen left at different stages in faulting. Two of the most important bonanzas have been found below the junction of the east fissure and the lode. One of them was in the Crown Point and Belcher and the other the famous body of the then California and the Con. Virginia mine. The former appears to have been deposited iu one of the ordinary lens-shaped openings which so frequently occur iu all veins from a non-conformity of the walls; but the latter seems to have had a somewhat different origin. A portion of the footwall appears to have given way at this point, carrying a large amount of rock from the hanging wall with it, and the ore deposited in the space thus formed.

Of course, the space referred to was not actually empty, but was filled with fragments, leaving considerahle interstices between them. These fragments, however, after decomposition, acted as absorbeuts for the mineralized solutions and became charged with argentiferous minerals. For the most part, and with entire propriety, they were mined and milled as ore. The new find made by Mr. Tangerman will not at all unlikely prove to be the formation from which the Con. Virginia honanza hroke away, in which event it will prove an open sesame to renewed life and vigor on that lode without regard to the uncoveriug of a gold-hearing lode lying far to the west of the Comstock.

Concentrates.

THE University of California has $400,000 to loan.

THE Grass Valley Miners' Union has $1000 to loan.

THE directors of the Kate Hayes Mining Company of French Corral have levied an assessment of $1 per share.

ORE from the Saowshoe and Cabinet rangos near Libby, Montana, is bringing that district into prominence.

A FRENCH syndicate has bonded for $50,000 the Mazatzal gold group in Touto Basin, Arizona, and a force of men is developing the property.

A PART of the 20-ton smelter for the copper mines on Illinois river, Oregon, has arrived at Grant's Pass, Oregon, on its way to its destination.

IN 1894 in the United States there were produced 14,804 tons of magnetically concentrated ore, and 72,312 gross tons of jigged and hand-sorted ore.

THE Melbourne, Australia, Mint received 537,944 ounces of gold during the first six months of 1895, as against 510,288 ounces for the same period in '94.

ALEX JANIN has filed a suit in the Superior Court against Howell Hines et al. for $9500, said to be due for working ore at Mioas Prietas, Sonora, Mexico.

THE Rogue River Mining Company has incorporated at Portland, Or.; capital stock, $100,000; incorporators, C. B. Spencer, A. F. Groves and Isaac Meyer.

THE Phœnix Mining Co., capital stock $500,000, has organized in Spokane, Wash., T. W. Witherop, president. The property is at Trail Creek, B. C.

THE Mines Investigation and Development Company is incorporated in Denver, Col., by T. W. Goad, M. P. Pels and W. Westoo. Capital stock $100,000.

THE Utica and Stickel mine is rapidly being unwatered, and by Monday it is expected the lower levels will again be dry enough for work to be resumed therein.

CRIPPLE CREEK, COLORADO, men think that camp will yield $10,000,000 gold in '95, and figure that the total gold output of the State for '95 will be nearly $20,000,000.

AT NELSON, B. C., judge has decided that in that province a mining claim, the location of which was recorded May 8th, '94, was not relocatable till midnight, May 8th, '95.

A NEWLY patented explosive called "chromite" is being introduced and, it is claimed, will become a strong competitor of dynamite in strength, safety and freedom from fumes.

THE North Bald Butte Gold Mining Company, with a capital stock of $100,000, has incorporated in this city. H. Vernon, A. R. Dow, G. R. Vernon, M. Prescott and F. A. Berlin are directors.

A GENERAL CONVENTION of the mining men of Washington, Oregon, Idaho, Montana and British Columbia has been called to meet in Spokane, Wash., to organize the Northwest Miners' Association.

THE Master of the Mint reports that the total gold yield of New South Wales for '94 was 324,787½ ounces; the Mining Registrar's returns for the same time place the amount at 246,904 ounces.

IN the big fire at Bingham, Utah, last week, P. McAvinny, a miner, lost his valise and his gold dust in the Griffin Hotel. He patiently panned the ashes of the ruin all next day, and recovered more than he had lost.

IN the Pinacate district, Riverside Co., 85 men are working on the Santa Rosa, Golden Chariot and Good Hope, and keep 30 stamps continuously dropping. Ten additional stamps will shortly be erected on the Santa Rosa.

C. W. HASTINGS and Sam'l Poorman of this city have bought the Ragon quartz and gravel mine, three miles from Nevada City, and will buy machinery and develop their property, which has been under bond for some time.

THE Carson, Nevada, *Tribune* says: "The sale of the Silver Star mines by Jim Yerrington is only a question of a very short time now. It is understood that there are several syndicates who are willing and anxious to buy."

FIGURES from the counties of El Dorado, Amador, Calaveras, Mariposa, Nevada, Tuolumne and Placer show a gain in population from 1890 to 1894 of 38.56 per cent, illustrating the general advance in mining interests therein.

ANDUS SMITH, of Milwaukee, Wis., the principal owner of the Slocan Star, Kootenay, B. C., is reported to have negotiated the sale of that property to an English company for $1,400,000. The report is discredited at the mine.

THE reports regarding great prosperity at Globe, Arizona, are misleading. No "600 men" are employed. There are about fifty miners working for wages in the camp, and about a hundred waiting and longing for an opportunity to work.

THE Secretary of the Interior has decided that there are no means whereby the work of the United States Mineral Commission in Montana and Idaho can be continued after September 15th, when the appropriation becomes exhausted.

THE Yreka Gold Mining Company has organized at Hollister, San Benito Co.; capital stock, $150,000, all subscribed. The company has acquired a mining property near Yreka, on Humbug creek, the old Spencer mine, and development work has commenced.

FOR the week ending the 8th inst., at the Broken Hill Proprietary (Australia), 3848 tons of ore were treated, yielding 266 tons of lead, containing 102,517 ounces silver; also 1175 tons treated by amalgamating and leaching plants, producing 11,364 ounces of silver.

THE total value of the clay products of the United States for 1894, excluding pottery, was over $65,000,000. The only comparison that can be made is with the census of 1890, which placed the value at $67,000,000. Fifty-three per cent of this value was in bricks.

BOUNDARY CREEK DISTRICT announces itself the legitimate successor of Trail Creek, B. C., as "the boom belt." Capt. Adams says "development and transportation are all Boundary needs to make a great district," which can with equal truth be said of a hundred other mining sections.

A PETITION for a rehearing of the Hale & Norcross case was filed with the Supreme Court last Saturday. The appeal is from that portion of the decision which decreed that Alvinza Hayward and his co-defendants should pay $210,000, with interest, on account of excessive charges for milling.

NEVADA CITY, Cal., miners formed a miners' union. The following named officers were elected: Pres., John Frandy; Vice-Pres., John Hocking; Financial Sec'y, Thomas Torpie; Recording Sec'y, Samuel Simmons; Treasurer, H. Jauch; Warden, Morris Eastis; Conductor, W. Harry.

IRWIN C. STUMP is quoted in a New York City paper as saying: "The great excitement in Europe over mines has extended to this country, and there are ten mines now offered for sale in New York to one in San Francisco. I think this movement in American mines will begin in the fall.

A RECENT legal decision is to the effect that a placer location made prior to the act of August 4, 1892, of land chiefly valuable for a deposit of glass sand and building stone, is not a legal appropriation of the land, and the subsequent intervention homestead entry of another will defeat the placer application.

A PROSPECTOR, talking of Cripple Creek, Colorado, says "it is the only camp that I know of which they prospect with plows, mine with road scrapers and literally ship the scenery." This is on a par with the old-time description of a part of Arizona, "where they cut hay with a hoe and cut wood with a hammer."

THE leaching mill at Keystone, Robinson district, White Pine Co., Nev., owned by A. Jackson and Henry Kiue of Eureka, burned to the ground last Tuesday night. One hundred cords of wood were also burned. The mill was erected about eight years ago by Harry Featherstone, at a cost of $10,000, and is a total loss.

T. F. CORNING of New York and H. P. Daniels of Denver are reported to have bonded mining property near Silver City to the extent of about $1,000,000. The property bonded includes the Black Jack group and the Trade Dollar group. If what they have already bonded is reported upon favorably, work on the Butte and California road will be begun.

THE Grass Valley Miners' Union has issued a placard giving names of mines now working in the Grass Valley district, as follows: Maryland, Empire, Omaha, W. Y. O. D., North Star, Granite Hill, Orleans, Osborne Hill, Electric, Merrimac, Massachusetts Hill, Shamrock, Perrin, Banner, Independence, Brunswick, Pennsylvania and La Marque.

A BUTTE, Mont., dispatch says a deal is closed there by which an English syndicate becomes the purchaser of thirty rich gold claims, known as the Clipper group, in Madison county, and owned by Morris & Elling and Carmen & Bennett. The consideration is $750,000. The Granite Mountain Company this week bought the Bullion, at Basis, for $100,000.

AROUND Anaconda, Montana, the rate for treating silver ores, which formerly varied from $12 to $14, is now reduced to as low as $9 for base ores and $8 for free-milling ore. This reduction has caused a little more leasing in silver mines than formerly, although no rate could be made by the smelters low enough to make silver mining profitable with silver at present rates.

"SECRET PROCESSES" are again reported successfully working beach sands. The aforesaid "secret" is "jealously guarded" by the owners. There is a good deal of such "secrecy" reported and a good deal of humbug generally connected with it. This time it is "at the Yakitat glacier on the Alaskan coast," where two men "got 180 ounces in 34 days." The story is very unlikely.

THE Western Federation of Miners, Butte, Montana, has issued a lengthy address regarding the Cœur d'Alene mines and miners, in which they say that "Wardner is a scab town, working under the guard of paid assassins." Our correspondents there, the local newspapers and the telegraphic reports have thus far failed to report any assassinations since the recent resumption of work at the Bunker Hill and Sullivan mines.

THE first decision of the railway mineral-land contest ever settled in the State of Washington was in the local land office last Wednesday, in the contest of A. L. Tinsley against the Northern Pacific, resulting in a sweeping victory for the settlers and miners. The contest involved three sections of land surrounding the Cleveland mine in Stevens county. The land is rich in mineral and the railroad fought hard to win, being represented by able counsel.

THE Printher, Price & Burnap Mining Co. is organizing at Los Angeles with $2,000,000 capital, with Dr. J. C. Price as superintendent, to operate in the Twenty-nine Palms district, San Bernardino county. The company owns several claims and is reported to intend ordering considerable machinery and thoroughly developing its property. There is considerable attention attracted to the desert region in that part of the State, especially since the McHaney strike at the Desert Queen mine.

THE sluice box at the Van Winkle, B. C., mine turned up a nugget in a peculiar form some days ago. It was in the shape of a sovereign made in her majesty's mint, London, in 1852. It was discolored, and had evidently been in the earth for years. It was probably lost by some miner in the early days, has the distinction as gold of having been twice mined, and is a peculiar example of the accidental here on earth. A short time ago four $20 pieces of the vintage of '53 were similarly unearthed in Shasta Co.

THE Homestake Mining Company's report for the year ending June 1, 1895, shows a surplus of $478,117. The net proceeds of the company's output of gold and incidental products was $1,537,807. In his report to Lloyd Tevis, president of the company, Superintendent Greer says: "The ore reported a year ago at the 800-foot level has been crosscut and found to have a width of 450 feet. We have twenty years' ore in sight." The Homestake mine is controlled by Mr. J. B. Haggin and other capitalists of this State.

THE Calaveras *Citizen* hears that the Gottschalk mine is again in the hands of its owner. The mine was bonded by Robinson & Veith in July, 1894, for a term of one year. In December, 1894, E. S. De Golyer bought the bond and started to work the property. On July 20th Judge Gottschalk, the owner of the property, upon solicitation from Mr. De Golyer, extended the time of payment for the property thirty days, or to the 21st inst. When this time had expired Mr. De Golyer asked for further time, but the Judge refused to grant it. The *Citizen* says another purchaser for the property will soon be found. The mine is one mile west of San Andreas. Two shafts have been sunk on the vein about 700 feet apart. The west shaft is in 110 feet deep and the east shaft is 195 feet. In the latter the vein is over seven feet wide, a great deal of the rock showing free gold.

ONE of the most profitable occupations of the United States Government is the coinage of five-cent nickel pieces and one-cent bronze pieces. The cost of the bronze disks from which the cents are stamped is about twenty cents per pound, and a pound of them produces $1.46. Nickel ready for coinage costs thirty-two cents per pound, and a pound produces $4.43 in five-cent pieces. The average profit of seigniorage on the coinage of these minor coins for the past few years has been about $650,000.

IT is reported from Spokane, Wash., that an agreement has been reached for the consolidation of the Poorman and Tiger mines on Canyon creek in the Cœur d'Alenes, Idaho. A new company has been organized, capital stock $1,000,000, to take the two properties, giving 500,000 shares for each. The Tiger is owned by S. S. Glidden of Spokane, and the Poorman by a stock company of Spokane and Montana mining men. The two properties are silver-lead, and have been worked since '88. It is expected that by working the two mines as one property a saving of $70,000 annually will be made.

OF the men employed at De Lamar, Lincoln Co., Nevada, mines there are 175 under the De Lamar Company and 25 in the April Fool mine. The others are scattered among various prospects. The Monitor and Jim Crow mines of the De Lamar Company are said to be on a true fissure vein, and there is enough ore reputed to be in sight to keep the mill running for five years. Thirty tons of ore that was recently shipped from the April Fool to the Salt Lake smelters gave a net yield of $18,000. Capt. De Lamar has offered to subscribe $4000 for a public school building if the citizens will furnish an equal sum for the purpose.

IDLE in a yard in Yuma is a mute reminder of the days of great expectations along the Colorado river twenty years ago. It is one of the largest—perhaps the largest—wagon ever built. The hind wheels are seven feet in diameter; the front ones five feet; the hubs are two feet long and two feet in diameter. The axles are steel. The wagon cost $2000, and had a carrying capacity of twenty tons when new. It was built at the order of Miller, Cargle & Co., to carry ore from Castle Dome to the Colorado river, twenty miles, but the company suspended operations soon after it was finished, and it has never been used.

R. H. GRIGSBY of Calistoga, who is in Durango, Mexico, in the interest of a San Francisco mining company, writes to a friend: "The country is rough. Where we went around the big Granite mountain, northeast of Weaverville, is a level country beside this. We have plenty of fine water; our mill (ten stamps, eight pans, four settlers) is run by water power (a Pelton six-foot water wheel, three-inch nozzle, eighteen-inch pipe, 120-foot fall). The ores here are low grade, but the great advantage is that silver here is worth $1.29 per ounce. It pays for all labor, wood, material, lumber, and buys most of the supplies we use."

THE Alaska-Treadwell Gold Mining Co. report that during the year ending May 31, '95, it milled 241,278 tons ore, which yielded $2.65 per ton. It cost $1.37 per ton to mill the ore, a net profit of $1.28 per ton. Of the $2.65, $1.70 was free gold, 95 cents sulphurets. During the year 200 men were employed, 170 whites, 30 Indians. The average wages were $3.50 for whites, $2 for Indians. The 240-stamp mill crushed the 241,278 tons at a cost of thirty-six cents per ton. The receipts for the year were $639,697, expenses $330,162, profit $309,535, showing what can be done with "a low-grade proposition." Dividends aggregating $300,000 were paid during the year, being six per cent on the capital stock.

THE July and August quicksilver receipts here aggregate nearly 7000 flasks. The receipts for the first six months of the year were 14,230 flasks. The exports by sea from Jan. 1st to June 30, '95, were 7439 flasks, valued at $283,668. Of this, 5000 flasks went to New York, 2194 to Mexico, 200 to Central America, 44 to British Columbia. The local price is quoted at $41. There is a steady increase in the quantity exported as compared with former years. The rail shipments for the first six months of '95 were 6959 flasks, giving a total shipment of 14,398 flasks for the first half of this year. In 1884 quicksilver was quoted at $30.50 a flask of 76½ pounds; in 1885, $30.25; in 1886, $35.50; in 1887, $42.25; in 1888, $42.50; in 1889, $45; in 1890, $52.50; in 1891, $45.25.

A MINE at Monthieux, near St. Etienne, in the Department of the Loire, France, was abandoned by its owners several years ago because it could no longer be worked at a profit. The discharged miners, finding themselves without work, formed a co-operative concern and obtained a title to the abandoned mine. They set to work, and by strict economy and unflagging industry made the mine pay. Miners in the neighborhood engaged with their employers in continual wrangle over wages, sought and in many cases secured employment in the co-operative concern. The founders of the latter, however, would not admit the newcomers on equal terms with themselves. When it came to the question of wages they would not pay to the new men the same rates that were paid to the co-operative owners, who, by extraordinary efforts, had turned a hole in the ground into a paying piece of property. When the new miners made a fuss the gens d'armes were called in, resulting in the dispersal of the malcontents with the usual threats, boycotts, etc.

Personal.

C. E. GRUNSKY, C. E., has removed his offices to 530 California St., room 23.

MR. LOU CAMERON, late manager of the Dominion Mineral Company, Sudbury, has been appointed manager of the Stratheyre Mines, L'd, at Fairview, B. C.

ASTRONOMER BARNARD'S place at the Lick observatory will be occupied by W. J. Hussey, late professor of astronomy at Stanford, from which place he has resigned to accept a position in the State University.

R. M. CATLIN, of Elko county, Nevada, leaves San Francisco this week for South Africa, where he has been engaged at a lucrative salary in the mines under control of Cecil Rhodes. Mr. Catlin expects to leave New York with his family about October 12th, and will be located at Johannesburg.

Mine Development the Basis of Great Prosperity.

To the Editor:—There is one feature connected with the mining industry which is but little understood and it is the matter of mine development, or to make it more clear I will say the lack of mine development. For nearly half a century I have been more or less identified with the mining interests of California and Nevada and consider myself as observing as the most of men; but not until the last year or so have I really grasped the extent of this great defect and detriment to our State's progress—not only of the State but of the people at large.

For the past two years I have resided in San Francisco and have given more or less attention to the promoting of mining interests, and in this way the fact of the universal lack of mine development has presented itself more clearly. Of course we all know there are many mining localities where "locations" are undeveloped, but that there is, comparatively speaking, one universal lack, is hardly comprehended.

This lack of development makes one point quite clear to my mind and it is that the whole system of mining laws relating to work is wrong, when the best interests of the whole people are considered, and this defective system is what leaves such a vast number of "prospects," as we will call them, to lie from year to year unworked. As it is now, and has been for years, a claim can be laid and maintained by simply recording and defining its boundaries and presumably doing $100 worth of work per annum, and here I will assert that not one case in twenty is $50 worth, actual value, put in per annum, on locations that are inactive. To my mind there should be laws for forced development after the locator's first year of occupancy, or a forfeiture of all interest in the same. A law of this character would cause the locator or owner to bestir himself, and it would not only be of great benefit to the community but to the locator. I would not advocate any law to cripple the miners; I am too closely identified with them. But this way of holding on, as some do, to five or six claims and do nothing by way of valuable development, and playing the "dog in the manger" in preventing others, is not for the best interest of the majority of miners of the State and certainly not for the community at large, as some single location thus held undeveloped by the present laws, under developing ones might be the producers of millions of money for the present generation, and one year is long enough to hold mining claims on this do-nothing order. Every one can see what a change such a law would make in the activity of every mining section, and I pretend to say that it would revert to the good of the owners themselves.

When it comes to the question of forced development or a forfeiture of all interests, I wish to say that but for the fact of forced development—the power of raising money by assessments—the Comstock would never have yielded up its four hundred millions of gold and silver, the most of which found a way into the business channels of San Francisco, giving life to trade and vigor to the people. But for this I doubt if $50,000,000 would be produced.

As before stated, I do not want to deprive the miner of any advantages for gain; but is not one year long enough for any one in these lightning times, when days of activity are crowded into hours, to consider if he can develop his find or get some one else to?

My desire in writing as I do is to see the miner more active, for "where there is a will there is a way." We want to be producing more gold and more silver, and we need not fear getting too much of the latter, as in 1896 we will make money of it—16 to 1—and build more mills with it.

Then, again, only development to a given depth should give a title, and not dollars and cents, and no title should be given on any claim until a shaft of at least 200 feet in depth is obtained, or a tunnel of at least 300 feet is run on the lode. This would be defined work and, being done, a perpetual title should issue to the miner without further expense. As it is now, to secure a title the miner is subject to an expense of from $300 to $700 for his patent. The miner has been the best friend of the Government, and now he wants the incentive of title after his expenditure for development; this point granted, and rapid development would ensue. This amount of work on any lode would clearly define the general character of the prospects and do for commanding the attention of capital for further development or prove it worthless. While I speak of a 200-foot shaft or a 300-foot tunnel on a lode, I do not consider this a developed mine by a long shot. My idea is that the real value of a mine is not determined short of 1000 feet in depth; but this costs money. And here I wish to state that I do not believe there is a mineral-bearing lode, of any well-defined character and which would pass the inspection of any creditable mining engineer, but what will develop a mining property of value, far beyond the cost of expenditure, at some point on the line of a thousand feet. This is more the rule than the exception, so that great wealth is in development and not in the eternal scratching on the surface.

To be sure we have developed mines in many mining counties, and many of them are 1000 feet in depth, all having been great bullion producers, ranging from $500,000 to $13,000,000 each; but where there is one, considering that we have been quartz mining for over forty years, we should have quadruple the number of active gold producers.

Let us reflect a moment on what South Africa has done within the past ten years, and to-day, as a result of its enterprise, is producing over $3,000,000 of gold per month. Here, in California and Nevada, with as vast and valuable gold fields as any spot on earth, we are, with over forty years' of experience, only producing the small sum of, say, $14,000,000 per annum, and all our business men are complaining of the slackness of trade and the scarcity of gold. Is it not apparent that there is a wrong to be righted? And while our Manufacturers' and Mechanics' Association are looking broadcast for the bettering of business, which will tend to enlarge their purses and make trade more prosperous, let them also encompass as one of the legitimate pursuits of prosperity the expansive industry of mining, and give their word of cheer and influence in advancing the miners' interest and landed rights.

But we will return to the state of affairs as they are before us at this time. When we stop to count up the developed properties of the various mining counties of the State and then consider the vast number of undeveloped ones, we comprehend the fact that millions lie buried, which under a different and more active system of development from what we are working and holding under would be doing good not only for our own population but for the whole world. There is not a single week but what I am in receipt of many letters from parties having "mines" which they desire to dispose of, and now and then comes a mining report, and I make the assertion that out of every twenty "mines" there will not be a single one deserving of the name of mine, and this from a lack of proper opening.

There is one very prominent idea in the minds of prospecting miners and it is that if they have a 50-foot shaft or a 100-foot tunnel on the lode that they have a mine; but where one good prospect has these, there are 100 of less development. If the people of the mining counties doubt this assertion let them cast their eyes over the mining field of their own section and figure on the developed lodes and undeveloped ones, and then they can realize what they have within their grasp in the way of golden wealth, with no one grasping for it. And why? I will answer: Because the amount of development does not justify the thousands of dollars generally asked for the property. In these later days of greater experience there must be something to show for the demand, and it must be so that it can be estimated by measurements, as to width, quantity and value per assays, and on this showing it is very safe to see if the demand is in excess of estimated value. And here let me say: The period when holes in the ground have a value is passed; there must be developed merit for coin.

San Francisco is flooded with "mines," but when the offer is critically examined into, even in the city, it too often falls short, and then if the "prospect" does present acceptable features and enough to induce the expenditure of time and money to examine the property, in nine cases out of ten there is something to be discounted.

At the present time there is an active demand for good developed properties, and I will say right here that it is less trouble to sell a good developed mine at a fair price than it is to find one. In one day I had five requests from the East and all wanted well developed, active, producing properties — not so much the production of bullion as the production of ore, as a guarantee for a milling proposition and so that some safe computation as to value could be made, to justify the price asked. It is a fact that it is almost impossible to meet such demands.

Now comes the question, How is this inactivity of mine development to be met? I do not know as my plan would be acceptable to the lazy miner, but the enterprising one would rather have less quartz, with a chance for more coin. "I have a fine mine but no money to develop it" is too often expressed, and too often a distressing fact, and this position of affairs is what we must meet.

Before I enter upon the plan of how, I wish to engage the mind of the reader to the fact of the possibilities of a great golden future; that for every present producing property we should have fifty, and if what we produce now is $12,000,000 per annum from the quartz reefs, we should produce at least $30,000,000. The business men of this and of all the mining States are seeking activity and enlargement of their business channels in order to accumulate more gold, and here on the Pacific coast our mountainous sections are ribbed with veins carrying the precious metals and many are lying idle for the want of money and muscle to open them. It is about time the communities, especially in the vicinity of these deposits, should awaken their sleeping energies and bring into active use the wealth at their very doors. To-day all Europe is alive with a mining spirit and sending their capital to South Africa, Australia and New Zealand, scattering a few dollars also on this coast. Suppose Europe was favored as is California and Nevada, is it likely there would be so little care for the great metallic wealth with which we are blessed? It is a remarkable fact that one seldom appreciates that which he has in abundance, and this may account for our neglect in not developing the treasures at our very doors. Californians want to begin to think of their mining empire, and by a system of rapid and extensive development begin the opening of the wealth that lies beneath the surface. We can boast of vast grain, fruit and vine fields—making California one of the most livable and enjoyable of countries and having a value of millions per annum—yet with all this surface wealth it falls into insignificance when compared to the wonder of treasure that lies underground. It is time the whole people began to realize the possibilities of the annual product of the precious metals, if they would but turn their attention and a minimum amount of capital toward developing them.

The British people have grasped the possibilities of the untold millions in South Africa and they have secured from the Government a tract of territory equal to all the mining districts of California, into which they are pouring millions of dollars and their surplus population, to unearth the buried treasure. It was British mining enterprise that opened the Witwatersrand of South Africa and which up to date has produced, since 1885, $116,074,928 in gold and which will yield for 1895 $40,000,000 more. Here let me state, that within this period, or say nine years, they have invested in mining enterprises about $134,000,000, in South Africa alone.

This is mining enterprise and it is the kind of spirit the people of this coast should exhibit; it is also the possibility of California and Nevada if we but throw in our energy, capital and muscle in bringing forth the buried treasure within our boundaries. The fact is clear to all, that there should not be any lack of business or prosperity in a territory possessing such varied resources as have California and Nevada, with less than a million and a half of people, combined. I speak of Nevada in connection with California from the fact that we have been since the first, and are now, so closely allied as to be almost of one interest. At the same time, my arguments and interests are in and apply to all the mining States and Territories. My desire is to see American mining enterprise equal that of any land; and viewing our vast mining possessions, if we but prove ourselves equal to the advantages before us, we should surpass them. But to do so we will have to bestir ourselves. For the purpose of opening the many undeveloped mining properties held by the poor prospector and claimant, it has been suggested that a syndicate of wealthy capitalists be organized and, under certain conditions, that they assume the work. But this is not far-reaching enough, but is good as far as it could be induced to go; besides it is subject to a good deal of distrust, which should not be, as agreements can be made capable of protecting the miner.

The plan which seems feasible to me, and likely to have the best results, will be for every mining camp to have its own developing company, made up of the merchants, manufacturers, miners, and I may say farmers of their own section, and that they enlist their friends elsewhere to take chances in working and finding mines. Let this company appoint a competent and reliable mine inspector for the purpose of selecting the best of such "prospects" as may be offered for development, on terms deemed just to both parties—the owner or owners on the one side and the development company on the other. To keep up this spirit of development, one of the conditions of the contracting parties should be that after the expenditure of a given amount of money, presumably enough to fairly open the mine, then both should agree upon a value and have the mine disposed of. Then more capital would be brought in for machinery and, in turn, for the output of a developed mine. A few such deals as this would give renewed life to all our mining towns.

These local development companies would not be subject to the same feeling of distrust as foreign companies, from the fact that they would be acquaintances, at least. To my notion, by this expenditure of money there is as much certainty of profit as by any class of business, provided your leading miner possesses experience, critical judgment and common caution. The sale of one developed property by the company would no doubt allow a good advance on the investment and thus induce the further movement in the same direction, and in time every mining center could be building up its own prosperity.

Some may say mining is too uncertain, but here let me state that mining of to-day is not what it was twenty years ago even. Labor is cheaper; explosives are not only cheaper, but more effective; mechanical devices have been perfected, and are cheaper; and with all these, electricity is distributing a cheap power, whereas in the past steam was expensive. Though all of these have tended to advance the profits, yet they are only a part of the great benefit that time and science have done for mining. Twenty years ago the average yield of ore value of all the milling in California was not to exceed one-half. To-day the per cent obtainable at at least one-third less

expense is from 85 to 95, and this is more easily secured than was 50 per cent twenty years ago. Thus it is reasonable to say that 40 per cent more value is obtainable to-day, at 30 per cent less cost, than was the yield and cost of mining, say, twenty-five years ago; and it is reasonable to consider that mining is one of the legitimate industries of this coast. I can assert that no business can be conducted with more certainty, provided unquestionable experience is at the helm of affairs, and, further, without experience and critical judgment, none is more uncertain. Mining cannot be conducted safely by men uneducated in the business, and this inexperience is what was at the bottom of so many failures in the past.

There is one more fact connected with our mining interest and it is that our educated California and Nevada miners are considered the peer of those of any mining country, and when it comes to the exact knowledge of how to produce the most, with the least labor and cost, they outrank them all. Then, again, in a mechanical sense, California mining machinery is superior in all its forms. With this and all that I have called the reader's attention to, we are to-day behind in our mining spirit. Is it not time there was an awakening? Is it not time we reached out more actively in order to unearth the treasures of the mining empire at our very doors?

ALMARIN B. PAUL, M. E.

Room 58, Crocker Building, San Francisco.

Buying and Selling Mines.

TO THE EDITOR:—Up to date the "mining exchanges" have contented themselves by opening offices in the cities and advertising for mines of merit, charging a fee for entrance and asking for a bond and agreement, covering their commission. As the average prospector is content with the MINING AND SCIENTIFIC PRESS and his county paper, the advertisement fails to reach him or if it does, his past experience has not impressed him favorably with these agencies. He would rather go out and find a mine than attempt to write out a description of the ore he possesses, and in consequence the mines sent in to the agency are some abandoned locations or unsalable properties that have been secured by the numerous bar-room operators. As the agency fails to secure mines it fails also in securing customers, and the office is abandoned. What is wanted at this time is a practical business corporation; this should have sufficient capital, as the amount that can be profitably invested is without limit. It should be in charge of a competent manager, who should have in his employ experienced men who "know a mine when they see it. These agents should make a personal canvass from mine to mine in each of the mining counties. When a property is found that has the earmarks of a mine in size and value of vein, with suitable location, good title and reasonable terms, a report should be sent in to the manager if offered the mine secured, an experienced miner put in charge and the property developed in the best manner to show its worth. When this has proceeded far enough to establish the merit of the mine it should be listed for sale, the work continued, and, when sufficiently developed, the mine equipped. If the bond expires by this time the property should be bought and worked as a business proposition until sold. Developed mines in profitable operation are not now for sale at prices that the average investor will pay, while the thousands of undeveloped prospects have so little in sight that the capitalist hesitates about investing, as he has neither the time nor inclination to develop the prospect into a mine. In every mining county there are to-day several properties that have a showing difficult to convince the experienced miner that they only need work to make them mines, while everywhere are to be found prospects that it will pay to give a short trial. Values are advancing everywhere. Prospects that could have been secured for hundreds a year ago are now held at thousands, while the five to fifty-thousand-dollar mine has gone up to twenty-five to one hundred and fifty thousand dollars. So also with the terms. The miner is no longer willing to bond his mine for a year without any consideration, but now exacts a portion down as an evidence of business. There is no business that will yield as great returns for the money invested as the development and sale of gold mines under competent, honest, business management. The old way of securing a mine and selling a small portion of the stock to pay for the mine, at a big advance on its cost, develop and equip the same and allow the operator to retain the majority of the stock at a big profit and at no expense to himself, has made several mining millionaires but has kept the industry in disgrace and turned capital into other channels. Of late the capitalists have been going direct to the mines themselves. The report of one, the general manager of one of the largest English mining companies, reads: "We secured a mine for five thousand pounds, the equal of which has never before reached London for less than fifty to two hundred thousand pounds." This departure must work for the good of the industry, for if any one thing more than another has served to damn mining among investors it has been the misrepresentation, over-valuation, and subsequent failures resulting from the purchase of worthless properties, on the strength of reports by high-priced experts. Every camp in the State and all other mining territories can point to magnificent failures of this class where millions have been invested and lost, and unfortunately by the very best of people. Your experienced mining operator, like Hearst, Hayward, Baldwin, Lane, and others, is not caught napping in this way, but buys a mine as he would any other property on his own judgment, and conducts it on the same business principles that he would apply to any other business.

Murphys, Cal., Aug. 19, '95. E. H. SCHAEFFLE.

Critical Periods in the History of the Earth.*

By JOSEPH LE CONTE, of the University of California.

INTRODUCTION.

Inapplicability of European Standards.—Geology was first studied in Europe, and the divisions and subdivisions of the rocks and of time were based on the great unconformities of the rock system and the great changes of the life system observed there. When investigations extended to other countries, naturally, similar conditions were looked for and apparently found. Closer study, however, soon showed that the correspondence was not complete for America, and seemed to fail entirely for India, Australia and Africa. The tendency, therefore, in recent years has been to seriously doubt whether there are any divisions which apply to all places; whether we should not give up trying to write a general history of the whole earth; whether the history of each continent must not be studied for itself. There seems to be a real danger of opinion going too far in this direction. It has been proposed, therefore, that this question be discussed by this Congress of Geologists.

It will be admitted that for a comprehensive view of any subject some knowledge of the history of thought on that subject is necessary. First, then, a few words on this history.

Early Views.—In the early part of the present century events of geological history were supposed to be not only removed from direct observation, but so different from anything now occurring that exact reasoning on them, based on observation of causes now in operation, seemed hopeless. The construction of the history of the earth by interpretations of its structure seemed, therefore, a legitimate field for the exercise of the scientific imagination. Hence it was that unconformities of strata associated with sweeping and apparently sudden changes of life forms were naturally attributed to violent and destructive convulsions of the earth's crust and wholesale exterminations and recreations of all life forms. Geological history was a succession of catastrophes, each inaugurating a new era, which remained substantially unchanged until another catastrophe. This view was in full accord with the then prevalent doctrine of the supernatural origin of new organic forms and the permanency of specific types, and regarded as a strong confirmation of the latter. Geology was not yet a science in the proper sense of that term. It was a field for the exercise of imagination rather than inductive reasoning.

The basis of modern geology, structural and dynamical, was undoubtedly laid by Lyell in the idea that the study of "causes now in operation" producing structure under our eyes is the only sound basis of reasoning from structure to history; and, similarly, the basis of palæontology was laid by Darwin in the "theory of evolution or origin of organic forms by descent with modifications." But by a natural revulsion from the previous catastrophism these new views, especially before they were modified by the doctrine of evolution, were undoubtedly pushed much too far, and became embodied in the opposite extreme doctrine of uniformitarianism. According to this view, things have gone on from the beginning at a uniform rate, much as they are going on now—changes of relation of sea and land, now here, now there, now in one direction, now in the other—oscillatory and compensatory, without detectable progress in any direction and without assignable goal. The view was conceived in the spirit of the physicist rather than of the biologist, and may be called physical rather than geological. The many changes in the history of the earth were compensatory, not progressive. The underlying idea was stability rather than evolution. And even Darwinian evolution, when accepted, was supposed to imply evolution at uniform rate—uniformitarian evolution.

Now, however, opinions are settling down into a view which is a substantial reconciliation of these two extremes, viz., that of gradual evolution both of the earth and of organic forms, but not of uniform rate. According to this, as I believe, truer view, in the gradual evolution of the earth and its inhabitants at a whole, there have been periods of comparative quiet, during which forces of change were gathering strength, but resisted by an opposite conservative force (crust rigidity in the case of earth forms, inherited character or type rigidity in the case of organic forms), and periods of revolution, during which resistance gives way, and conspicuous changes take place with comparative rapidity. Changes, indeed, go on all the time, but more rapidly at these times.

I shall not stop to illustrate and show how all evolution, just because it is under the influence of two opposite forces or principles—the one progressive and the other conservative, the one tending to changes, the other to stability—is more or less subject to this law of cyclical movement. Laws and forces, indeed, are uniform, but phenomena everywhere and in every department are more or less paroxysmal or catastrophic, though not catastrophic in the old sense of being not subject to law.

Thus the fundamental idea underlying geological reasoning was first catastrophism, then uniformitarianism, and now evolutionism. But evolution moves not at uniform rate, but by cycles, as explained above.

How Far May Divisions Be Made General?—Now the important practical question in regard to these revolutionary changes—which all must admit for special localities—is: How far are they, or at least some of them, general? How far may they, or any of them, be used to determine the divisions and subdivisions of geological history of the whole earth? This, as I understand it, is the question under discussion.

Until recently, perhaps under the still lingering influence of the old catastrophism, the prevalent idea was that all these great changes marked by unconformity and concurrent changes in organic forms were general. Under this idea European standards of classification have been used as a procrustean bed to which all others must conform, even in detail. This has been found difficult for our American rocks, and impossible for those of India, Australia and South Africa. Therefore the tendency of the present time among most advanced geologists is strongly toward a rejection of all general divisions—to hold that all such changes are local, and therefore all divisions of record and of time, both primary and secondary, and therefore all classifications must also be local. But again the danger is that by revulsion this tendency also may go too far. It is against this that I would raise a note of warning.

If, indeed, the earth has developed as a whole, as evolutionism would seem to require, then we ought to expect that amid many smaller and more local changes there must have been some greatest revolutions which have in some way either directly or indirectly affected the whole earth, and which therefore may be used to form the basis of the primary divisions of time. In the gradual changes of the earth as a whole, whether by secular cooling and contraction or by slowing down of rotation by tidal friction or otherwise, there must have been, from time to time, readjustments of the crust affecting the whole earth.

(To be continued.)

*Bulletin No. 11, of the Department of Geology.

Physical Properties of Metal.

It was remarked by Raoul Pictet that pure metals with high melting points—such as platinum, iron, copper and gold—are all comparatively strong; and, conversely, metals with low melting points—zinc, lead, cadmium, bismuth and tin—are relatively weak. Metals with high melting points must necessarily be coherent and tenacious, because much heat is required to drive their molecules apart in reducing them to the liquid mobile state in which the molecules have very small coherence; and, therefore, at ordinary temperatures much force must be applied to overcome the cohesion of the molecules and break the mass. Conversely, in metals with low melting points a small elevation of temperature will overcome the molecular cohesion and render them liquid—that is, will melt them. Such metals will be weak, because if little heat is required to melt the metal less force will be needed to tear it apart; hence melting point and tenacity are clearly connected. Professor Dewar has shown, moreover, that the tenacity of pure metals and alloys is greatly increased by extreme cold—that is, by the closer approximation of their molecules; and this affords additional evidence that metals become stronger at temperatures which are further and further removed from their melting point.

Natural Gas in 1894.

The annual report of the United States Geological Survey on natural gas, recently submitted by J. D. Weeks, says that the important gas fields now are those of western Pennsylvania, western New York, northwestern Ohio and central Indiana, but gas has been found in commercial quantities also in Arkansas, California, Illinois, Iowa, Kansas, Kentucky, Louisiana, Missouri, South Dakota, Tennessee, Utah, West Virginia, Wisconsin and Wyoming. The highest actually observed pressure of the gas has been about 800 pounds to the square inch, closed pressure. In all districts the pressure has decreased steadily and materially. Heretofore natural gas could be easily carried in pipe for long distances under its own pressure, but now, in most places, artificial means must be used to drive it to the place where it is needed.

Mining Summary.

CALIFORNIA.

Amador.

GOVER.—*Republican*: The work of taking the water out of this mine is a formidable undertaking. Several weeks have elapsed since the task was entered upon, and the water level has been lowered not over one hundred feet. The object in view is to reach ore bodies and take out a quantity of rock for a test crushing. If it pays $3 per ton, it is claimed there are capitalists behind the enterprise who stand ready to pay $150,000 for the property. This would be sufficient to pay off the entire indebtness and leave at least $50,000 or $60,000 to spare. C. E. Purinton is in charge of the operations, with a force of about twelve men, part of whom are engaged in cleaning out the south shaft—which caved in for about 200 feet last winter. Considerable supplies in the shape of wood and lagging are on hand. The taking out of the water is done by skip operated by steam power, and between had air in the shaft and unavoidable delays in hoisting operations, the work proceeds irritatingly slow.

ANITA.—At this mine drifting north and south along the ledge has been extended about 80 feet in each direction, the vein holding out for that distance. This gives an ore shoot of 160 feet in length so far developed. The general opinion seems to be that they are on the top of a fine body of quartz.

Ten stamps of the South Spring Hill mill are running on Median rock. It is contemplated to make another sinking.

The hoisting works of the Amador Queen No. I are expected to start up in a few days.

Calaveras.

TO BE REOPENED.—The Oriental mine, at West Point, is to be opened after being idle fifteen years.

THE PURE QUILL MINE.—*Echo:* At the Pure Quill mine, on the Smith Flat Lode, near Angels Camp, one shift is kept at work in the mine, pending the completion of the hoisting works. A ten-stamp mill will be built on the mine as soon as the other work under way is completed.

THE ROANOKE MINE.—*Chronicle:* At the Roanoke mine new machinery, consisting of a water power hoist and six-inch Cornish pump, is on the ground at the Lamphear shaft, which the company has determined to reopen and sink 1000 feet. A tramway is being constructed leading to the company's mill, 1500 feet distant. Ore will be transported by this tramway until the company can determine the extent and value of the rock, when, if found good, a twenty-stamp mill will at once be constructed on the Lamphear ground. The eight-stamp mill is running night and day, and the property is yielding good dividends. At present the payroll numbers 35 men.

THE DONNOLLAN MINE.—*Citizen*: The contract of Swenson & Nicols to dig a 65-rod ditch to connect the Donnollan mine with the Calaveras river was completed this week. The ditch is not quite to the mill, but will be connected as soon as needed. It has a capacity of about 300 inches of water. The mill is being overhauled and ten additional stamps are to be put in, making fifteen in all. Immense timbers have been hauled out there during the week to be used about the mill, which the proprietors expect to have in operation about October 1.

Del Norte.

WILL RESUME.—Col. Yates has closed down his mine near Crescent City owing to the scarcity of water. Negotiations have been concluded whereby the mine has been bonded to a Chicago company for the period of ninety days, during which time, however, Mr. Yates has the privilege of working the mine. It is understood that the price to be paid is $5500, and that the new company will erect a $10,000 plant and proceed to mine upon a larger scale than has hitherto been attempted. This is good news for Crescent City.

Inyo.

THE SACRAMENTO MINE.—*Register:* Work is going along steadily at the Sacramento. The water pipe is laid for 300 feet, from where the end of the flume will be to the wheel. The ten-inch V-flume will be put up at once, but owing to the rough character of the country it must be built in sections and carried to its final location. The arrastras are nearly completed, and will when in running shape be well worth an examination by any one wanting a new idea in such machinery. The plant includes two pits, the drag-rocks in both being run from one seven-foot belt wheel.

The Sacramento is one of the oldest mines of this section. It has been worked for years by leasers, whose idea was to get the most money for their time, consequently it has been "coyoted" rather than mined. Such a system—working the rock which looked as if it would pay best and discarding all other—has left hundreds of tons of fair ore lying on the dumps. Samples have been picked up horning into the hundreds, though most of it is of course low grade. These dumps will be worked at once, work in the mine being pushed along at the same time.

The resumption of systematic work on the Sacramento has led to renewed prospecting in the neighboring canyons, particularly by Mexican miners.

Mariposa.

THE RED BANKS.—*Miner:* This company will soon commence the erection of their dam across the Merced river. Mr. Brooks will have his contract of cutting 500,000 feet of lumber completed by Sept. 1st. Already several teams are engaged in hauling the timbers, etc., to the river. The iron work, such as bolts, rods, spikes, etc., are already on the ground; and Painter & McCandish, the contractors of the dam, intend to start as soon as enough material is on the ground. A full force of men are kept at work driving tunnels and otherwise opening up the mine that it may be in shape as soon as the mill is up.

THE TYRO.—The station in the 600 is now cut out and the work of sinking to the 700 is being pushed with all possible speed. Drifting both ways from the shaft is being prosecuted, and it will not be long before they can hoist sufficient ore to the surface to again start up the mill.

Captain A. H. Ward says he will return shortly to commence operations on the Pinon Blanco Co. group of mines.

AROUND COULTERVILLE.—*Miner:* The Merced Gold Mining Co. will soon commence the delivery of material to the site of their new dam across Black creek. They are pushing the work of sinking the two three-compartment shafts with all possible speed. A full crew are engaged in sinking the winze from the Potosi to the Melvina. The same active development is under way at the Mary Harrison. The company are having large quantities of cord wood, mining timber and building material delivered to the various claims, which is an unmistakable evidence of their intention to not cease work for a moment until the property is thoroughly opened up.

Nevada.

SUIT BROUGHT.—*Transcript:* H. B. Nichols, through his attorney, A. Burrows, has brought suit against C. M. Joyce of Chicago, to foreclose a mortage of $47,000 on the Nichols quartz and gravel claim situated near Dead Man's Flat.

THE OLD CLAY.—*Transcript:* Walrath & Stone have purchased a hoisting and pumping plant for their mine in Brown's valley. They have named the mine the Old Clay. The machinery will come from Nevada City.

A NEW GRAVEL MINE.—The Live Yankee gravel mine is situated at Bald Mountain, near Graniteville, and from all indications will prove a valuable one as soon as it is opened up. It is owned by twenty young men of North Bloomfield and they have been working there for some time, three shifts a day being engaged. A tunnel has been run 400 feet, and is one of the finest tunnels in the State, being seven feet high and five feet wide. It is thought the channel will be reached in another 100 feet, which is expected to be completed about the middle of September.

In running the tunnel several rich pockets of gravel have been struck, which prospected at the rate of a dollar to the pan.

Plumas.

THE GOOD HOPE MINE.—W. C. Rees has the contract for erecting the restrainiug dam authorized by the Debris Commission at the Good Hope gravel mine below Oniou Valley At the base this dam is 44 ft. long and on top 210 ft., with a base 30 ft. wide. The dam is to be 40 ft. high. It is what is called a log-crib dam, anchor boiled to the bedrock, the logs being drift-bolted together. The company will lay about 1600 ft. of pipe, through which, after leaving the ditch, the waters of Onion Valley creek will be delivered at such a point as will give 240 ft. pressure at the mine. The company expects to be ready for active operation of the property next spring.

Shasta.

WATER FILINGS.—*Searchlight:* Wm. M. Fitzhugh of San Francisco, by his representative Geo. B. Hine, has filed on 150,000 miners' inches of water to be taken from Pitt and McCloud rivers, and utilized in generating power. The proposed plant to be established near the junction of these streams, and power to be transmitted from here, for use for mills. Mr. Hine says that much will depend on the success of the plant recently started at Folsom. To hold his filings Mr. Fitzhugh will have to commence work within sixty days.

THE IRON MOUNTAIN CO.—*Free Press*: Simultaneous with the driving of new tunnels to uncover immense ore deposits at the mine, there is a large force of workmen pushing the railroad enterprise. Several camps are located at various points and the graders are preparing a roadbed.

The company expects to force railroad building right through, completing the work in ninety days; but it will hardly be possible to do the work in that time.

The track used will be narrow gauge, three tracks to be laid from the smelter to the Southern Pacific track, in order that the cars of both railroads can load and unload at the smelter and Southern Pacific depot.

When all is in readiness for the treatment of ores at the smelter, it is estimated that 1000 men will be in the employ of the company, and that with this number constantly employed it will take forty years to exhaust the ore bodies.

Outside of the fact that this enterprise in itself will be of untold benefit to Shasta county, by the erection of the smelter it will be made possible for every small mine owner or prospector in the county to make money, as it is stated that the Mountain Mining Company will purchase all silicious ores having a value in excess of $4 per ton.

OREGON.

Jackson County.

Writing of Jackson County placer mines Leigh Harnett says at the Beekman & Huffer quartz mine, on a high hill three miles west of Jacksonville, Mr. Beekman is said to own 160 acres and he was told that within a radius of half a mile from the mine in question there are seven ledges. For so short a space that is something new in geology. More than likely, when development work brings more correct ideas, it will be found the lower deposits of ore, now thought to be ledges, are nothing but fractures from the intact ledges above. It is scarcely possible in creation for seven intact ledges to exist at depth in the narrow space of half a mile. Nevertheless, it is true the location now spoken of embraces three ledges, and that the company are opening the second and third. "In the upper tunnel on the second ledge, 105 feet long when I saw it," says Mr. Harnett, "the vein was two feet wide all the way, with both walls showing out in excellent form. The ore all along the tunnel and on the dump is really rich. Midway in the tunnel a hole some ten feet deep has been sunk to test the ore, and in this it is found still richer. In the lower tunnel the vein spreads out to cover ten feet and in streaks is very rich. From appearances it is not likely the vein will continue its present width, and for permanency at depth it is to be hoped it will not. As a proof of the richness of the ore, I may state 100 pounds were sent to the Selby smelter at San Francisco, which on reduction paid $800. This is enormous; but Selby can always be relied upon. There are also some remarkably rich streaks of silver in the ore, a thing I was not expecting in southern Oregon until Mr. Huffer called my attention to it. Were I an owner in the mine, however, I should regret this duplex ore, as the silver, apart from its depreciation in value, will give much trouble in the final reduction. A good mill is in course of erection, and when completed will run total expenses up to $6000."

SALE REPORTED OFF.—It is announced that the contemplated sale of the Black Butte mine is off, and that the present owners, John Gagen, T. C. Taylor, J. M. Herman, M. G. Munly and T. J. Munly, who recently incorporated, will proceed with the development and operations. Mr. Gagen asserts that there are in sight 200,000 tons of ore on the Black Butte, and that it is easily worked ore. He expects this summer to be sending in bullion bars to Pendleton.

WILL PUMP WATER.—Major Newell, who has been experimenting with a boat intended to pump auriferous gravel from the bottom of Rogue river for the past several months, has leased a placer claim from Wm. Hamlin, two miles from Grant's Pass, and will use the engine from his boat to pump water for the use of the mine.

Jas. H. Kincaid has sold his interest in placer mines in Willow Springs district to B. W. Huston, who with J. W. Ingram will put in a hydraulic to operate them.

NEVADA.

Robinson District.

The Eureka *Sentinel* hears that J. B. Willson, who is at Ely in the interest of a San Francisco syndicate, has offered $150,000 for Chainman mine. Among the conditions named are a given time to complete the purchase of the property, the erection of a 25-stamp mill and pumping machinery of a sufficient capacity to drain the mine. The vendees will guarantee to have all of the machinery in working order in four months, to pay the owners 40 per cent of the gross yield of the mine for that period and the balance in cash if they determine to conclude the purchase. The same parties have also the purchase of the Keystone property under consideration.

BRITISH COLUMBIA.

AN EXTENSIVE MINERAL BELT.—Attention is being directed to the country twenty-five miles south of Nelson, where veins similar to that discovered at Rossland have been located. Discovery is reported of a similar class of ore five miles north of Rossland on Murphy creek, and at Sullivan creek, nine miles north of Trail creek. The belief of those familiar with the country is that the same belt of mineral extends from Rossland across the Columbia through to the valley of the Salmon river near the Nelson & Fort Sheppard Railway.

BIG DITCH FINISHED.—At Cariboo the Cariboo Hydraulic Company's big ditch was completed on the 19th inst., and water turned on, so that the company does not expect any further trouble regarding water supply and will be able to run till the end of the season.

AROUND ROSSLAND.—The new machinery on the LeRoi is in operation. The largest shipment ever made from that mine in one day was 107 tons. There are now about 100 men employed on the mine.

The War Eagle has commenced shipping again.

A body of ore has been struck on the Robert E. Lee at a depth of 60 feet.

They are working in shipping ore on the Homestake and have two carloads on the dump. This ore is different from any other in the camp. The last assay ran 70 ounces silver and $12 gold.

At the Crown Point the shaft is now down 20 feet, all the way in the ore body, and they have taken out over 100 tons.

ALASKA.

AT BERNERS BAY.—*News*: The steamer Rustler arrived from Berners bay yesterday morning and reports mining operations of the Berners Bay Mining & Milling Company to be in a most flourishing condition. During the past two weeks the tramway from the Bear group of mines has been completed and they expected to begin carrying ore to the mill to-day. Within a week the mill will be running to its fullest capacity and night and day the hills will reverberate with the echoes of forty stamps pounding away on the richest ore in Alaska. The new Gates crusher is in position and will be put in operation at the same time the additional stamps are put to work. This crusher is so arranged that it will break the ore finer than usual and it is thought the mill will easily handle from 140 to 150 tons of ore daily. The several ledges recently cut in the Bear crosscut have been developed to such extent that they could furnish plenty of ore for the forty stamps, but as plans now exist twenty stamps will be run on Comet ore and twenty on the Bear. A recent clean-up of a two week's run on Comet ore with twenty stamps produced two beautiful yellow bricks which could not be but perfectly satisfactory to the management. About 300 feet of drifts and levels are run each month and the company is now employing 150 men. A new storehouse 30x70 is in course of construction, the wharf has been extended to deep water so boats can land at any stage of the tide, and Supt. Willis Nowell has had new offices and quarters built for himself. Work on the new ditch 3,000 feet long which is to greatly increase the water supply is well under way and will be completed in a few weeks. It is the purpose of the company to run all winter and they are now installing a complete steam plant to be used as an auxiliary power when the water supply fails. The engine, which is of 130-horse power, boilers, etc., together with several thousand fire brick, arrived on the Topeka and as soon as loaded on a scow will be towed to Seward City. Two compressors will be included in the plant, one for the Bear mine and one for the Comet.

A FAVORABLE SHOWING.—The July report of the Alaska-Treadwell Gold Mining Company of Douglas Island, Alaska, shows that the mill crushed 23,800 tons ore, which averaged $3.69 per ton, besides 417 tons sulphurets worked, yielding $28,830. The bullion shipment for the month was $87,756.

IDAHO.

"GLACIAL GOLD."—The *Silver Hammer* says: If as much gold was taken out in any other county, in this or any other western State, as there is now being gathered on the South Fork there would be a regular boom. Over 100 men are making from $3 to $7 per day washing glacial gold by the rocker method on the south fork of Snake river in Fremont county.

THE YELLOW JACKET.—Prof. N. A. Bibikov, a Russian geologist, is making an examination of the properties of the Yellow Jacket Mining Co. The company are operating forty acres of property. The manager, P. J. Arkel, in a period of ninety days, has put in place a new sixty-stamp mill, and has completed over a mile of pipe line, which brings water to the mine and mill from Yellow Jacket creek. The nearest railway station is at Red Rock, Mont., 125 miles distant.

The Yellow Jacket is a gold proposition, producing at the rate of $25,000 per month. The old mill was destroyed by fire last summer. The mill now in use was furnished by the Frazer & Chalmers Company of Chicago. The ore deposit of the Yellow Jaeket is similar to that of the Homestake in Dakota, but the grade is higher, averaging $15 per ton, and all free milling. The company expects to operate all winter, and to increase the mill to 100 stamps early next season.

MONTANA.

THE PARROT DITCH.—The new Parrot ditch will be completed by September 15th. It is 18 feet wide at the bottom and will carry between 15,000 and 20,000 inches of water. It has a fall of 100 feet at the lower end, and will be 18 miles in length.

WYOMING.

"FIFTY DOLLARS A YARD."—At the Rinker & Davis discovery at Gold creek placer dirt is declared to go $50 to the square yard. Engineers have been sent to see if water can be taken from the mountains just above the placer ground, and if it can be done a ditch will be constructed. Parties who are investigating the ground say that there is no deposit of gravel in that section, so the gold must come from between there and the mountains, and miners are anxious to trace the source of supply. Gold creek is on the Continental divide at the south end of the Wind River range.

UTAH.

ONTARIO'S FORTY-SIX BARS.—S. L. *Tribune*: Forty-six bars of bullion, containing 21,836 fine ounces of silver, were received in this city yesterday from the Ontario, and the proceeds placed to the credit of the company. This represents the earnings of the bonanza for a week. The Daly, which is also under Hon. R. C. Chambers' management, is producing about half that amount.

Work on the great tunnel, which has now penetrated the hill for a distance of 15,490 feet, is still progressing. The breast is now at a point 1293 feet beyond No. 2 shaft, and that the purposes for which it was constructed are being fulfilled is revealed in the increased earnings of the property that is pierced by it.

BINGHAM'S TUNNEL SCHEME.—*Tribune:* Perhaps the boldest project that has been launched in Utah the present year is that which means the driving into the Oquirrh ranges at Brighton of a tunnel that will afford an outlet for the ores of no less than twenty-five mines that lie along its course. The great enterprise is undertaken by the Bingham Tunnel Company, and is the work of persevering endeavor on the part of those who have decided that Bingham is entitled to an outlet such as are to be found in Aspen, Leadville, Ouray and camps of similar magnitude. The tunnel will penetrate the range to a distance of five miles, and, connections with the various mines having been made, the production of ores should be less than one-half that which is now involved. This means much for Bingham and much for the smelters of Salt Lake City, and both can afford to work to an end that will witness its speedy consummation.

A NEW PROCESS AT BINGHAM.—For three weeks Col. Heffron, tells the *Tribune*, a new process for the extraction of gold from the ores at Bingham has been undergoing tests in that camp.

The process is what is known as the Kendall dioxide (sodium) cyanide process, the owners of it the American Cyanide Gold & Silver Recovery company. It is very similar, as described, to the cyanide process, this dioxide of sodium being added, it is said, to accelerate the action of the cyanide of potassium. The quantity of cyanide, it is said, varies according to the character of the ore with which it is dealing, although generally less than one per cent with the dioxide about one-fourth of one per cent. These, in solution at the percentages named, are applied as a leach to the granulated ore. The ore is

charged into n series of tanks or vats, where it is flooded with the solution. After a certain period of leaching the solution, which is now impregnated with the values, is drawn from the tanks and passes into the apparatus where it is brought in contract with an amalgam consisting of zinc and mercury, which the inventors have substituted for the zinc shavings introduced in the MacArthur-Forrest process. This amalgam, it is contended, absorbs the values contained in the solution, and from that the metals are removed.

COLORADO.

DENVER SMELTERS SHOW INCREASES.—Five of the leading smelters of Colorado have prepared comparative statements of their purchases of gold, silver, copper and lead ore for the first six months of the two years 1894 and 1895, a summery of which follows:

Lead—1894, 40,218,108 pounds; 1895, 38,758,-019; decrease, 1,460,149 pounds.

Copper—1894, 1,378,519 pounds; 1895, 2,331,-590; increase, 933,071 pounds.

Gold—1894, 105,441 ounces; 1895, 197,351; increase, 91,910 ounces.

Silver—1894, 7,674,911 ounces; 1895, 8,053,-327; increase, 378,416 ounces.

EL PASO CO.—The New Henrietta Gold Mining and Development Company has been incorporated by S. G. Sims of Cleveland, O.; J. W. Lane and E. Rotherg of Cripple Creek to operate in El Paso county with $500,000 capital stock.

EL PASO REDUCTION WORKS.—The El Paso Reduction Works at Gillett has 200 tons of ore waiting for treatment and 4000 tons contracted for, and is working a day and night capacity of sixty tons every twenty-four hours and turns out $90,000 per month. It treats ore averaging from $30 to $40, and, it is claimed, saves 95 per cent of the gold. They charge $8 for hauling and treatment and pay 95 per cent of the assay value to their customers.

ARIZONA.

PUSHING DEVELOPMENT WORK.—John Kasser, manager of the Kusser Gold Mining & Milling Co., is pushing development work on their mines. They have two tunnels, with track laid, 325 and 150 feet respectively; also a 100-foot tunnel and two drifts on the lead of of 50 or 60 feet each. The shaft is down 200 feet. There are about 300 tons of ore on the dump, and considerable stoping ground in the mine. Preparations are being made for the erection of a mill.

THE CONGRESS MINE.—The cyanide process at the Congress mine is said to be working very successfully on the tailings from the mill. It is also given out that the stamp capacity of the mill will be doubled soon by the addition of forty more stamps. This comp, next to Jerome, is the liveliest in the territory.

AT JEROME. — The United Verde Copper Company has completed a line of sluice boxes 700 feet in length for running off the water of the drain tunnel. The boxes are 12 inches wide, 12 inches high: each 12 feet long, of 2-inch planks. In the boxes large pieces of iron are placed to precipitate the copper contained in the water from the mine, as it runs through the boxes. By this method the company are deriving a revenue of $150 per day. This copper water has been running to waste for years. Mr. Clark, the principal stockholder, is having made six converters double the size of the present converters. When these converters are in place at the works and running the gross output will, it is expected, be increased one-third. The output for 1894, it is said, was 10,000,000 pounds of copper, 750,000 ounces of silver and $1,500,000 gold.

THE EMMET MINE.—*Courier:* The Emmet gold mine, located near the Jerome wagon road, at the foot of the Black Hills, has been bonded to capitalists for a large sum of money. They will expend several thousand dollars in development, commencing work next month. Ex-Gov. Powers, of the real estate firm of Powers & Doran, owns one-fourth interest in the Emmet. The other owners reside in Cleveland, Ohio.

ORO BLANCO DISTRICT.—A mining deal was closed on the 28th at Tucson wherein Supt. H. Harrison of the Franco-American Mining Company purchased the General Dietzler group in the Oro Blanco district. Active operations involving the expenditure of $25,000 in mills, reduction works and development will soon be begun.

MARICOPA COUNTY.

Gazette: Good reports come from the anciently located Brown Nigger mine, Black canyon district, where Ross & Keegan have sunk a shaft 75 feet deep, about water level, from which a 50 ft. drift has been run to connect with an old shaft sunk years ago by Nigger Brown himself. The shafts were connected to secure good air. The workings are all in good free gold ore which ranges in value from $30 to $50 per ton. Near by the same parties are working the old Jack Swilling mine, where Swilling laid out and named the now extinct town of Jamestown. Swilling worked this mine in 1865-7-8-9 and 70. Some of the ore ranges in value as high as $500 a ton. This rich ore was exposed on the surface in an unworked part of the mine by a heavy downpour of rain. Swilling's original location notice, written by himself, is now on record in Maricopa county. It reads: "I claim 300 feet on either side of this vein and as far north and south as my winchester will shoot."

THE NEW MILLS of the Grand Rapids Pulp & Paper Co., at Bearin on the Wisconsin river, are being rapidly pushed forward. The company is constructing a dam, excavating a large mill pit from solid rock, and erecting large substantial brick buildings. They have contracted with James Leffel & Co., of Springfield, Ohio, for fifteen of their large Samson Turbine Water Wheels, which will be in position in November. All the work is being done upon the most approved plan, and is of the most substantial character.

The Proposed Compromise.

The mineral land committee of the State Miners' Association met at the office of Chairman A. H. Ricketts in this city last Wednesday afternoon to consider the compromise proposition offered by Mr. W. H. Mills, representing the S. P. Co., in a letter to Mr. Jno. M. Wright, representing the mineral land committee, of date Aug. 21st, which was fully discussed in these columns last week. Messrs. Ricketts, Wright, Yale and Hoffman were present. Mr. Loftus, the other member of the committee, is in Tuolumne county, but wrote strongly opposing the railroad proposition as outlined in Mr. Mills' letter.

The whole matter was fully and freely discussed; the fact that the original proposition emanated from the railroad company, and was taken up by the committee in an honest desire to do equal justice was brought out, and the additional fact clearly shown that the committee or the association is not "fighting" anything or anybody through any desire for conflict or reprisal, but in its determined, intelligent effort to preserve the mineral area of the State from illegal absorption if it find anything or anybody in its path it of course will make most strenuous effort to remove the obstacle.

It was the expressed judgment of the committee that the proposition as outlined lacked sincerity and was not feasible; the objections to it were so manifest and the merits of the proposition so meager, it was so one-sided in its suggestions, so chiding in its tone and so dictatorial in its conclusions, that the committee felt that justice to the interests represented could not be served by an acceptance of the "compromise" proposition.

It was finally decided that the committee formulate a reply to Mr. Mills' communication, suggesting the wisdom of three commissioners in place of two, as he proposed, and declining his proposition that the committee withdraw its protests, at the time suggesting that when the railroad company evinced a willingness to withdraw its selected lists and recede from the position it has assumed would he time enough to ask the committee to abandon its present successful line of action. The committee then adjourned. In six weeks will take place the Annual Convention of the State Miners' Association, when the whole matter will receive further attention.

California Miners' Association.

Call for the Fourth Annual Convention of the California Miners' Association.

The annual convention of the California Miners' Association will be held in San Francisco, at Pioneer Hall, Fourth street near Market, on Monday, the 14th day of October, 1895.

County associations are hereby notified that in accordance with Section 4 of Article IV of the constitution of the California Miners' Association, each county organization shall be entitled to one delegate to the State convention for each ten members, said delegates to be selected as such county organizations may determine.

The fostering of the mining interests of the State of California will be discussed at the coming convention, and the principal subjects which will receive attention will be the reports of the committee on legislation. [The full text of the bill to amend chapter 6, of title 32, of the Revised Statutes, relating to mineral lands and mining resources, has appeared in these columns.]

Following is a bill to appropriate money for the construction of works to impound mining debris, and thereby to protect the navigable streams of California:

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled—

SECTION 1. That there is hereby appropriated out of any money in the treasury not otherwise appropriated the sum of one million and thirty thousand dollars, which shall be immediately available and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission, appointed under the act of Congress entitled "an act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California and the branches of said tributaries.

SEC. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of such Commission, it shall be safe to use the same, it shall be lawful for such Commission to make the order provided in Section 13 of said act, upon proceedings being first had and taken in accordance with the provisions of Sections 9, 11 and 12 of said act, but in such cases the owners of the mines affected by said orders shall not be bound by the proviso to said Section 13 of said act nor by the provisions contained in Section 16 thereof.

SEC. 3. The said Commission shall also have the power to make the order provided for in Section 13 of said act as to any mine or mines whenever it shall appear to the satisfaction of said Commission that no impounding works are necessary other than the means already provided by nature to protect from material injury the navigable streams mentioned in said act and the land adjacent thereto, upon proceedings had in accordance with Sections 9, 10 and 12 of said act.

The question of the protection of mineral lands of the State of California against the encroachment of the Central Pacific and other railroad companies will also be considered.

County associations are once more urged to help, in every way possible, with funds to carry on the work which has been so ably begun. A large representation is desired. By order of the executive committee.

W. C. RALSTON, Secretary. J. H. NEFF, President.

San Francisco, Cal., Aug. 28th, 1895.

Coast Industrial Notes.

—Commencing September 2nd a rate of 65 cents per 100 pounds on canned goods (minimum weight, 24,000) will be put into effect from all California terminals to Chicago, Buffalo, Cincinnati, Pittsburg, and all intermediate points over the Santa Fe route via Mojave.

—An Austin, Nev., *Reveille* reportor gravely tells a listening world that a man named Reese is engaged in killing wild horses in the Edwards Creek range for the purpose of getting the hides and tallow; that the hides bring $3.50, and the tallow, when tried out into oil, is worth $1.50 per pound.

—During July the ten principal cargo mills of Puget sound shipped 31,692,844 feet of lumber by water, the largest amount, with the exception of June, for any month during the current year, the increase of over 4,000,000 feet in constwise shipments making up for a falling off in the foreign shipments as compared with June.

—It is reported in San Diego that the Southern Pacific has secured control of the Cuyamaca railway, and that $500,000 of the bonds have been purchased at 30 cents on the dollar. The secretary of the Cuyamaca road says no sale has been made to the Southern Pacific or to any other outsider.

—The Southern Pacific Company, the Pacific Mail Steamship Company, the Occidental & Oriental Steamship Company, the Peninsular and Oriental Steam Navigation Company, and other rail and water lines, have entered into a contract whereby a passenger may buy a ticket around the world from any point on any of the lines joining for $610.

—The earnings of the entire Atchison, Topeka & Santa Fe system for the twelve months ended June 30, 1895, on an average operated mileage of 9150, or 188 miles less than in the previous year, were $39,795,802—a decrease of $2,529,595; the operating expenses were $30,012,690—a decrease of $985,524; and the net earnings $9,783,111—a decrease of $1,544,071.

—By January 1st, '96, 1000 M. feet of Washington fir and cedar will be made into box cars for the Great Northern railway, which has let an order for 250 cars. The contract provides that the woodwork be entirely of Washington fir, with the exception of the roofs, which are to be of Washington cedar. Orders have been placed for the lumber among six mills.

—Water tanks are sent from this city to the Hawaiian Islands, where they are a necessity. In large districts the inhabitants depend on rainwater for drinking and cooking. Redwood tanks, when filled with water, are not attacked by beetles. Their sizes, five feet to eight feet in diameter, six feet to twelve feet high, vary according to the sizes of the buildings. The staves are from 2½ to 3 inches thick.

—Last winter it was formally announced that an exposition of industries and fine arts would be held in the City of Mexico next year, to open April 2d and continue six months, and during the spring the papers published the details of the organization and rules and regulations and various information for American exhibitors. But for the last two or three months all reference to this proposed exposition has subsided, and even our Mexican exchanges are not saying anything about it.

—The State Board of Prison Directors and J. L. Maude, Commissioner of the State Bureau of Highways, at a meeting at Folsom last Saturday to consider the establishment of a rock-crushing plant at that place, decided to put in a plant of the capacity of 900 tons, or 90 carloads per day. For districts remote from the source of supply the Board recommended that each locality he provided with a portable rock crusher and a road roller weighing eighteen tons to he operated by a gasoline engine. The cost of gasoline is about $2 per day. Proposals will be advertised for.

—At a meeting of the Marysville City Council, bids for furnishing a pumping plant for the new sewerage system were opened. The Risdon Iron and Locomotive Works bid: Pumping plant as per specifications, $7195; same with Heine boiler, $7695; same with horizontal tubular iron boiler, $7210. Byron Jackson bid: For pumping plant capable of pumping 15,000 gallons per minute, 15 feet high, or 22,500 gallons per minute, 10 feet high, $10,000, and also submitted a proposition to furnish another plant according to plans and specifications for $11,000. The Babcock & Wilcox Co. made a proposition for furnishing a boiler for the pumping plant for $1803.

—Few people catch fish at a depth of 800 feet. There are fewer fishermen at a depth of 4500 fathoms or 27,000 feet. This is a depth of about five and one-half miles. Uncle Sam is the only angler in the world who insists on such deep-sea fishing, and measures depths not by hundreds of feet, but by miles. He has a boat built especially for the purpose. The vessel, the United States Fish Commission steamer Albatross, comes into California harbors frequently, and is an object of rare interest to the landsmen. The Albatross is strictly a scientific fishing craft. She cost over $100,000, is 234 feet long and of 1074 tons displacement, with a brigantine rig. Her business is to follow ocean fish as they migrate from their summer to their winter home and to observe their manner of life. This work includes the collection of fish, mud and shells from a depth of 27,000 feet to the surface. The ingenuity of the scientists and navigators has resorted to the employment of electric light at great depths, in order to attract heretofore unknown and otherwise unobtainable fish into the trawl which is let down from the ship's side.

—The fastest run across the continent was that of the Jurrett & Palmer special theatrical train, which in June, 1876, ran from Jersey City to Oakland, Cal., in three days, eleven hours, thirty minutes and sixteen seconds. The distance was 3301 miles. On Nov. 14, 1889, a new regular fast mail train left the Grand Central depot in New York at 9 P. M., and reached San Francisco in four days, twelve hours, forty-five minutes. In October, 1891, John W. Mackay and Miss Virginia Fair crossed the continent in a special car attached to regular trains in four days, twelve hours, twenty-eight minutes. On October 29, 1891, James L. Flood performed the same journey in four days, twelve hours, fifteen minutes.

—The commission of seven engineers appointed by the Mexican Department of Communications to inspect the terminal points of the Tehuantepec railway have compiled their report. They suggest jetties to deepen the bar at the Coatzacoalcos river at a cost of $4,000,000 and for Salina Cruz a system of breakwaters costing $7,000,000. Plans are also submitted for land-locked harbors at Juchitan lake, thirty kilometers south of Salina Cruz, as preferable to breakwaters at that point. The cost of converting the lake into a harbor, excavating a canal from the ocean to it, is ten millions. The Government will soon decide whether it will give out the work to contractors or do it itself. Many American and English contractors are ready to put in bids.

—California and coast manufacturers and producers do not generally appreciate the wealth of the Central American republics and the opportunities there for business. The republics are all prosperous and greatly prefer to do business with the United States; they like American goods best. The greatest obstacle in the way of our people doing business with Central American republics is the manner in which goods are packed. Freight taken from here is unloaded on the open ocean in launches from which it has to be hoisted onto piers and from the pier it is taken to some central town in the interior on pack mules or in ox carts. And unless goods are packed in strong cases, burlapped and strapped with iron, a large percentage of them are likely to be lost or stolen. Goods enter the customs house with the full weight marked on the package, and the full customs rate has to be paid, even if there is only one-tenth of the goods left in the package. Europeans understand packing thoroughly. A package shipped by an English firm, for example, can be rolled down the side of a mountain and it would not be injured a particle, even if it contained glass. If California shippers will give proper attention to this matter of packing their goods, they can have all the business they want with Central America. Another obstacle with which the shippers of the United States have to contend is that their representatives in the republics cannot speak Spanish, and that is a very necessary thing. The representatives there of English, German and French houses speak Spanish like the natives, and that gives them a great advantage. The people down there prefer to deal with the United States, but our merchants do not cater to their trade. Dry goods, for instance, are packed so carelessly that they are usually ruined or stolen while they are being handled there. The people down there will pay for anything they want. Price don't cut any figure. They have got the money, but the shippers of this country will not learn what the Central American people want. American tailors and cutters could make a good thing there. Natives can do the sewing, but they know nothing about cutting out a suit of clothes. As to shoes: Boston-made shoes are shipped to Germany and England, repacked there, and shipped to Central American ports and sold there for less than in the United States. There is an excellent market for cotton prints, but the same difficulty comes in here—Americans will not cater to the market. The bolts of cloth shipped from the United States are considerably shorter than those shipped from Europe, and as a result, when a woman buys a bolt of European cloth, no matter what the price, she sees the bolt is longer and that settles it; she thinks she is getting more cloth for her money.

Cyanide Patent Claims.

P. George Gow, local manager of the Gold and Silver Extraction Co. of America, L'td, has a cablegram from Glasgow which says:

"To-day, after strong opposition and full discussion, amendment to British patent has been allowed exactly as claimed. This confirms British patent and makes position very strong."

This is virtually a victory for the patentees, and will of course strengthen their case in this country and elsewhere.

In handing down the opinion, it was held that "in substance the invention consists not merely in discovering that a dilute solution of cyanide of potassium could be used to extract gold from its ore, but showing the country the best practical method of doing it by leaving baser metals behind, which had never occurred to any one before.

"None of the voluminous evidence introduced served to show that the patents had been anticipated by prior publication nor that any commercial result had ever been attained until Messrs. MacArthur and Forrest proved the commercial value of this discovery.

"The testimony taken in Denver and Salt Lake by the Commissioner appointed by the High Court of the South African Republic resulted in proving that the use of cyanide to extract the precious metals from their ores was unknown in the United States prior to 1890."

In the Right Direction.

To the Editor:—As yet the wealth of California (enough to pay off the debt of the world) lies dormant in its sulphurets or so-called base ore mines—too low grade to pay cost of shipping and treating at the various points where such work is done and yield a profit to the owner.

Any means—metallurgical, chemical, mechanical or electrolytic—which will free the gold and silver from these base encasings quickly and cheaply at the mine is what is most needed here to-day, and he that accomplishes such a feat will be rewarded not only by the best of friends (money), but with the blessings of the whole fraternity and the world at large. Every one engaged in mining knows the infinite need of some means to this end. Yet we speak lightly of "processes," while they are the only sources we have to look to for the solution of this problem; and why not here as well as in South Africa, where cyanide and other processes at the bottom of the great English speculative boom have caused an increased gold production to $40,000,000 this year in place of $6,000,000 five years ago?

Therefore, I for one am ready to hail with encouragement anything in this direction, knowing it will also be accomplished here sooner or later by some one, and I deplore the man who cavils at all such worthy efforts.

Yesterday I visited the works of Mr. W. L. Brown at 710 Capp street, San Francisco, who for three years has been working to disintegrate sulphuretted ores and at the same time separate, set free and amalgamate upon plates the gold and silver contained—all without heat. I found his process a very simple mechanical, chemical and electrolytical one, and also that it did accomplish the dissolution of sulphurets and amalgamated the gold and silver from two pounds of very base tailings, which I took with me, in one hour's time to my satisfaction.

His company may contract to put up a plant for the treatment of twenty-four tons a day at the Kennedy mining district for the Nevada Era Gold Mining Co., Humboldt county, Nevada, giving a guarantee to save and amalgamate 90 per cent of the assay value of their $10 ore, containing antimony, copper, iron, lead and zinc, at a cost not exceeding 90 cents per ton. This ore is absolutely non-amalgable otherwise, and the mine is worthless as it is. This plant would cost $10,000, and, if contracted for, would be in operation within sixty days, no royalty to be charged at any time to others.

I learned that Mr. Lane of the Utica mine felt sufficiently interested, after having visited these works, to send Mr. Brown 1000 pounds of that ore to treat, also that other equally responsible mining men are very favorably impressed with Mr. Brown and his process. Hence, I do not feel that my time or good-will have been spent in vain; and knowing the progressive sympathy of the Mining and Scientific Press for all good things, I beg to draw your future attention to the further practical demonstrations to follow on a commercial scale at the mine and to add that, while this road has been hard traveled by thousands of able philosophers, Mr. Brown has my prayers and belief, judging from results so far, that he will reach this much desired goal.

A. H. Jocelyn,
"N. Y. Daily Financial News."

A report was published recently to the effect that certain employes of the Carnegie Steel Company had discovered a process for welding copper to iron or steel, and the statement was made that the Carnegie Steel Company had paid a handsome sum to the inventors for the right to use it. This statement had been denied by the officials of the company.

Prices for incandescent lamps are now the lowest ever known, ranging from 22 cents down to 14 cents, with a rebate for returned bases.

Scientific Progress.

Huxley's Philosophy.

The late Prof. Huxley, who has been credited with inventing the word "agnostic," and who was an agnostic in belief and practice, did not believe, with Descartes, that brutes are unconscious machines, but that they and men are more or less conscious sensitive automata—a position he fortified, as Maudsley and other recent physiologists have done, by instances drawn from pathological states.

This theory put in the form of theses is thus expressed:

1. There can be no sensation without consciousness.
2. There can be no consciousness without co-operation of the brain.
3. Sensation and consciousness are in some inexplicable way caused by molecular changes in the brain, following upon these as one event follows another, the casual link between motion and sensation being a mystery.
4. All actions which take place unconsciously are reflex, and reflex actions are the operation of an insentient mechanism; they are therefore as purely mechanical as those of automata.
5. The animal body is a reflex mechanism. Even when the brain co-operates with the other centers and produces, this product is not an agent in determining action; it is a collateral result of the operation.

The fifth theses is plainly hypothetical and inadequate as a statement of all that the body is, or at least it depends upon and is an expression of the celebrated "reflex theory" in physiology.

As to the human body, Professor Huxley expressed his belief thus:

"I hold, with the materialists, that the human body, like all living bodies, is a machine, all the operations of which will, sooner or later, be explained on physical principles. I believe that we shall, sooner or later, arrive at a mechanical equivalent of consciousness, just as we have arrived at a mechanical equivalent of heat.

"If a pound weight falling through a distance of a foot gives rise to a definite amount of heat, which may properly be said to be its equivalent, the same pound weight falling through a foot on a man's hand gives rise to a definite amount of feeling, which might with equal propriety be said to be its equivalent in consciousness. And as we already know that there is a certain parity between the intensity of a pain and the strength of one's desire to get rid of that pain; and, secondly, that there is a certain correspondence between the intensity of the heat or mechanical violence, which gives rise to the pain, and the pain itself, the possibility of the establishment of a correlation between mechanical force and volition becomes apparent.

"And the same conclusion is suggested by the fact that, within certain limits, the intensity of the mechanical force we exert is proportioned to the intensity of our desire to exert it."

And he protests that if some great power would agree to make him always think what is true, and do what is right, on condition of being turned into a sort of clock and wound up every morning before he should get out of bed, he would instantly close with the offer. He declared:

"The only freedom I care about is the freedom to do right. The freedom to do wrong I am ready to part with on the cheapest terms to any one who will take it of me."

Prof. Wiley says that "one of the grandest discoveries of modern science" is the agency of the microbes in enabling plants to absorb from the air the nitrogen which is the chief factor of their growth. The theory was first suggested by Pasteur, and it is thought to be fully confirmed by the researches of independent investigators. If it does not deceive expectation it will completely revolutionize agriculture. To increase the growth of plants it will only be necessary to feed their roots with water containing the proper microbes.

A simplified process for silvering glass is thus described by M. M. Auguste and Louis Lumiere, in the *Journal De Physique*. Take 100 parts by volume of a ten per cent solution of nitrate of silver, and add, drop by drop, a quantity of ammonia, just sufficient to dissolve the precipitate formed, avoiding any excess of ammonia. Make up the volume of the solution to ten times the amount by adding distilled water. The reducing solution used is the formalbehyde of commerce. The forty per cent of solution is diluted to a one per cent solution. The glass to be silvered is polished with chamois leather, and the bath is made up immediately before use by mixing two parts by volume of the silver solution with one of formalhehyde. The solution must be poured over the surface without stoppiug. After the lapse of five or ten minutes, at a temperature between 15° and 19° C., all the silver in the solution will be found to have been deposited on the glass in a bright layer, which is then washed in ruuning water. It is then varnished, if the glass side is to be used, or polished if the free surface is required for reflection. The method does not require the scrupulous care necessary with other methods.

Professor Spencer, in a paper read hy him at Brooklyn, reckons the age of the Niagara Falls to be 31,000 years. Hitherto the conjectures as to the age have been based on the observed rate of recession alone, but Professor Spencer takes into consideration also the changing conditions of erosion during the periods or "episodes" of the river's history. He believes the river itself came into existence 32,000 years ago; that it drained the Erie basin for 1000 years without a cascade, and that as the Ontario basin slowly sank the falls were made, until the total descent was 424 feet. He thinks it probable that the falls will last another 5000 years, and that their end will not necessarily be effected by the river cutting its way back to Buffalo, hut rather by changes in its basin, which will turn the draining of the upper lakes into the Mississippi.

An instrument has been invented which enables the condition of the atmosphere in a room to be readily seen. It is called the kinoscope, and measures the amount of impurities which any given volume of air contains. Everyhody is familiar with the blue tinge which distance lends to far-off objects. This is due to the dust and impurities in the atmosphere between the ohserver and the object. The kinoscope consists of a metallic tube terminated at either end by a glass chamber. At one end is a pump which exhausts the air from the tube, and at the other a faucet which allows the air of the room to be tested to be drawn in. Some damp white blotting paper is placed in the tuhe, and by means of diffracting lenses the tint of the air is thrown onto the blotting paper. The strength of the blue tinge denotes the condition of the air.

Director Holden, of Lick Observatory, writes that before the art of photographing the moon can be carried to greater success there must be plates of greater sensitiveness and finer grain. Now the photograph of a volcanic crater on the moon's surface will appear like a grain of the silver on the plate unless the crater is over a tenth of a mile in diameter.

The Director of the Lick Ohservatory is notified by telegraph of the discovery of a faint comet by Dr. Lewis Swift, at Echo Mountain, Cal., on Aug. 20. At 14 hours 0 minutes, local time, its position was R. A. 0 hours 27 minutes 40 seconds; and Dec. north 5 degrees 30 minutes. Its motions were northeast.

A Swiss Scientist has been testing the presence of bacteria in the mountain air, and finds that not a single microbe exists above an altitude of 2000 feet.

Mechanical Progress.

Notes About Belts and Belting.

A lecturer before the Chicago Engineers' Association says:

All belts should be pliable, with close texture, smooth and solid surfaces, as well as uniform thickness, and they should never contain split leather.

Leather belts are used for transmitting power in preference to gearing, because they are more readily connected, have quiet motion, are lighter than cog gearing, produce less wear and tear to machinery, and unquestionably cause fewer accidents.

Textile strength of belting varies to a considerable extent; hence care must be taken in selection of leather. Only center cuts from the center of the hide should be used; they are firmer, better filled and show the least stretch. Other parts from the hide have longer fibers and are stronger, but they are spongy and will wear in a curved condition. In other words, straight running belts cannot be made from the shoulder. Every responsible belt manufacturer knows what stock goes into his belts.

The fiber of the hide is its main strength and of the belt its main strength. Care must he exercised in tanning the skin so that the change from raw hide to leather is performed without injury to the fiber. Chemicals destroy these conditions and often burn the fibers. Oak-tanned or union-tanned stock is what makes a good belting. Purchase your belts from a recognized reputable manufacturer, who aims at perfection and caters to the consumiug trade in preference to the jobbing trade.

Manufacturers who make a specialty of furnishing "short lap" belts are the true friends of the consumers of belting. A "short lap" contains only that part of the hide which is in the center. Each piece is from 4 feet to 4 feet 6 iuches long by 14 to 18 inches iu width. It does not contain any soft, spongy or very stretchy part. The stretch, which varies from 3½ to 6 inches per strip of 4½ feet, is well worked out of each strip before it is joined or made up into the roll. Such oak-tanned manufactured helting will have uniformity iu weight, stretch, density and thickuess.

You cau always tell when the shoulders have been used in a belt by the uumerous creases on the surface and tendency of helt to curve while running on the pulleys; besides, the leather is of a loose, spongy nature. A cheap belt is always costly and will never fail to give trouhle, while a first-class short-lap belt will run for a long time without auy signs of crankiness. The grain or hair side of the helt is the weakest; it cracks more readily than the flesh side. It should be placed next to the pulleys for the above reason and because it clings more tenaciously to the pulleys, due to its smooth, close surface.

The whole question of driving power by belt transmission is based upon the speed at which they are driven. There is scarcely any limit to the life of a well-constructed and running belt, provided it is properly placed and looked after.

It is hard to state what width, thickness and length should govern the purchase and use of a belt for a given number of H. P. because there are many conditions bearing upon the subject. Increased pulley surface quickens the drive. Sbafts of pulleys sbould be perfectly parallel and the pulleys true and concentric.

Pulleys should he placed at certain distances from each other, about as follows: Small pulleys, about 15 feet apart; larger, 20 to 25 feet apart; very large, 25 to 30 feet apart.

Pulleys should be as large as possible—not much wider than the belt—and their speed should not exceed much more than 3000 feet of belt motion per minute. The diameter of pulley can he determined by the number of revolutions that is made by the shaft.

The speed of belt is not very hard

upon itself, hut it is greatly injured hy running over a small pulley, strapping tight at high speed. When a given amount of power is required, the smaller the pulley the tighter must be the helt in all cases.

Theory Alone Insufficient.

Talking of "the profession of electricity," C. H. Summers, electrician of the Western Union Company, at Chicago, says:

"Too many young men go into the business who are not fitted for it. They either start out fresh from school, filled with the idea that they can enlighten the world, or they are urged to go into the business by friends who think the electrical field a great one for a young man to enter. The young man himself wants to accomplish something without spending too much time and energy, and his friends urge him to secure a position which seems to offer advantages which no other does.

"The trouble with young men when they graduate, is not that they don't know enough, hut that they know too much, theoretically, and theory doesn't go in business. Practical electricians want practical men, and the only thing for the young man fresh from school to do is to throw off his coat and go to work. He must not only know why certain things are done, but he must know how to do them. He must have good, hard sense and know what to do when thrown on his own responsiblity. But the trouble is the boys get discouraged at the start. They have expectations, and when they are asked to work for $40 a month, to hegin with, they usually get tired and quit.

"A man to make a success of electrical engineering must first have a taste for the work and for electrical development; certainly he ueeds a common school education, and above all he must excel in mathematics. You can easily see why this last is so essential. A man might experiment forever and he eminently successful hut if he could not demonstrate satisfactorily why such things were practicahle he would never interest anyone, much less get anyone to invest money. No one man can cover the whole field. Electricity might he compared to the field of medicine. It is classified into specialties, and as there is in medicine oculists, physicians, surgeous, etc., so there are in the electrical business telegraph men, telephone men, electric light men, and power men. Each one covers his own particular field hut keeps track of the others only in a general way."

THE Chicago Hard Copper Company is reported to be turning out a commercial product of hard copper castings. The process consists in treating the molten copper with a chemical compound whose ingredients are uot disclosed, hut which the inventor states is not an alloy, heing introduced for its effect in rearranging the molecules of the metal. Fractures of the treated metal exhihit no indication of an alloy, hut show all the characteristics of pure copper. The castings are very smooth and free from hlow-holes. Remarkahle specimens are shown of tough castings, such as chain links which have heen suhjected to severe torsional tests without injury, inch-square hars which have stretched 3½ inches before being hroken in a testiug machine, etc. Cast hars of the treated metal have heen drawn into wire of high quality and rolled cold into thin strips of great tenacity and perfect surface. The inventor states that the cost of the treatment given is but trifling, amounting to ahout 60 cents per ton of copper castings. After the molten copper has heen treated, it is stated that it can he cast in ingots and set aside for making castings suhsequently without losing its peculiar property.

THE largest belt in the world has recently heen made by the Jewell Belting Company, of Hartford, for the Washburn & Moen Manufacturing Company. It is 118 feet long, 78 inches wide, and is four ply. It took the hides of 100 steers to make it.

Electrical Progress.

Electric Propulsion for Steamships.

The recent alliance between the Baldwin Locomotive Works and the Westinghouse Electric and Manufacturing Company has started a great deal of talk, sensihle and otherwise, ahout the substitution of electricity for steam on railroads. The idea that the same change might he effected advantageously on the great vessels which cross the ocean was suggested to C. H. Cramp, who replied that no conspicuous shipbuilder would think of such a thing for a moment. It was more economical to apply the power of the eugine on a steamship directly to the service than to convert it first iuto electricity and then use the latter to do the work.

This was a thing which any electrical engineer could have told the enquirer. Small launches can he propelled hy electric power which has previously heen stored in accumulators on land and transferred to the hoats; but the supply of energy is sufficient to last only a few hours, and then the exhausted battery is lifted out to he freshly charged, and new cells are put in its place. An ocean-going vessel cannot return to port every three or four hours, and, as at present constructed, a storage hattery capacious enough to hold the electricity which would he required iu taking an ordiuary steamship from here to Honolulu would weigh more than the whole ship. This phase of the suhject was not discussed hy Mr. Cramp, who considered only the idea of generating the current on shiphoard, hut to both schemes would equally apply his emphatic statement: "The application of electricity to the propulsiou of ocean steamships is practicahly impossihle."

Some New Uses of Electricity.

Calcic carhide, from which the new gas acetylene is made, is produced electrically by means of the arc in a furnace, and one ton, yielding ahout 11,000 cuhic feet, can he made for $20, while the quality is such that five cuhic feet per hour give a light of 240-candle power. "Electric sugar" is a phrase that has lingering odors of fraud around it, yet, as a matter of fact, one electrical horse power will refine daily the syrup from at least 100 tons of heet root, and several German factories treat their heet syrup electrically. In the manufacture of safety matches ahout 2000 tons of potassium chlorate are used annually, and nearly the whole of this is now produced electrolytically. One plant in the Jura mountains of 2000-horse power turns out 600 tons, and there is a larger plant in Dalecarlia of 6500-horse power. The use of the current is also extensive in the production of aniline dyes, and the electrical method is rapidly superseding all others in the production of chloroform. To the list of novelties may he added caustic soda, electrozone, hydrocyanic acid, and as in each case cheap electric current in large quantities is a desideratum, our big American central stations are interested in such developments. A considerahle propoution of the power from Niagara is already taken up hy factories producing aluminum and carhorundum with the aid of electricity.

I HAVE heard a friend of mine, president of one of the large lighting companies, remark that his superintendent's head was not the right shape. I am not sure that he should blame the superintendent for this. Really good men cannot he retained for the wages that every Tom, Dick or Harry that comes along may he willing to work for, and a good man can usually save his salary if given a fair opportunity. Don't make machiues out of your men. The interests are too variahle for this to prove successful. Put some responsihility on them. Make them feel an interest in the results, and better still, if you have a proper system of operating your business, you can provide for a premium plan on operation that will actually give the men an interest and at the same time tend greatly to your own benefit in the economical operation of your station.—J. S. Stephens, before the Northwestern Electrical Association.

Sacramento's Electric Carnival.

On July 13th electric power was received at the sub-station of the Sacramento Electric Power and Light Company in Sacramento City from the great works of the company, twenty-two miles away, near the town of Folsom. At that point a massive stone dam, making a fall of eighty feet, has been built across the American river, a torrential stream, just as it emerges from the foothills of the western slope of the Sierra Nevada.

The power developed, as it is delivered, is 4000-horse power. This is capahle of indefinite increase as the demand for electricity for light or power may require.

On Septemher 9th Sacramento will celehrate the installation of this great work hy an electric carnival, in which the Native Sons of the Golden West of California, to the estimated number of 10,000 will join. Sacramento invites all the people everywhere to witness this spectacle, aud unite with her in celehrating a triumph of energy, enterprise and progress.

Practical Information.

A New Species of Bear.

A bear that seems to he certainly a new variety, and is regarded hy some as a distinct species, is reported from Alaska, where it frequents the vicinity of the Mount St. Elias glaciers. It is of moderate size and is thus described hy W. H. Dall, the naturalist:

"The general color of the animal resemhles that of a silver fox. The fur is not very long, hut remarkahly soft and with a rich under-fur of a hluish-hlack shade, numhers of the longer hairs being white, or having the distal half white and the hastal part slaty. The dorsal line from the tip of the nose to the rump, the hack of the very short ears, and the outer faces of the limhs, are jet hlack. Numerous long white hairs issue from the ears; black and silver is the prevalent pelage of the sides, neck and rump; the under surface of the helly and the sinuses hehind the limhs are grayish-white, or even nearly pure white, I am told, in some cases. The sides of the muzzle and the lower anterior part of the cheeks are of a hright tan color—a character I have not seen in any other American bear, and this character is said to he invariahle. There is no tint of brown elsewhere in the pelage. There is no tail visihle on the pelts. The claws are small, very much curved, sharp, hlack ahove and lighter helow; the animal evidently can climh trees, which the browu bear cannot do.

"This hear is knowu to range ahout the St. Elias glaciers, especially near Yakutat, and a single specimen has heen killed on the mountains as far east as Juneau. About thirty-five skins have heen hrought to Sitka, mostly from Yakutat. A mounted skin, the only one known as yet (said to contaiu the skull) is in the possession of F. A. Bartlett, of Port Townsend, Wash."

How Mineral Wool Is Made.

Of those who know what mineral wool is, or silicate cotton, as it is sometimes called, prohahly only a small number are familiar with the simple process hy which it is made. The wool itself, serving a variety of useful purposes, as a non-conducting covering against heat and cold alike, for steam pipes and cold storage room walls, as a sound "deadener" in floors of buildings and as a means of fireproofing, among many others, is, as its name implies, a soft and woolly suhstance, consisting of a mass of very fine mineral fihers interlacing one another in every direction, and thus formiug an endless number of minute air cells. The wool appears on the market in a variety of colors, principally white, hut often yellow or gray, aud occasionally quite dark, and is made by converting scorial and certain rocks while in a molten state into a fibrous condition hy a steam hlast directed against the liquid material. Blast furuace slag forms the raw material for one variety of the wool, and sandstone for another, yielding respectively slag wool and rock wool, the latter heing preferahle for pipe covering because of the ahsence from it of sulphur, which, with moisture present, becomes an active eorroding agent. The furnace slag or the rock, as the case may be, is melted in a large cupola, and as it trickles out at the tap-hole in a somewhat sluggish stream it meets a high-pressure steam jet which atomizes the woolen mineral, if it may he so termed, hlowing it iu fleecy clouds into the storage room provided for it. Soft and downy, the stuff settles wherever a resting place affords itself, the heavier and easier wool coming down first, while the lighter portions are hlowu farther along hy the force of the steam and settle in the more distant parts of the room, the material thus naturally grading itself into varieties of different quality. A thousand pounds of wool per hour are turned out hy one of the cupolas, and after the storage room has heen blown full the flocculent mass is pushed into hags, ready for the market. The whole process affords an admirahle and interesting illustration of the utilization of an utterly waste product.—Cassier's Magazine for Septemher.

The Largest River.

The largest river of any age of which there is any evidence in the world, according to a remarkahle geological discovery reported to the Royal Society of Canada, at its late meeting at Ottawa, was a great preglacial river in northern Canada. Dr. Robert Bell, who produced scientific evidence of the correctness of his discovery, pointing out that it was generally admitted hy geologists that the continent of North America, immediately hefore the glacial period, stood at a much higher elevation than at the present time, amounting to perhaps, between two and three thousand feet. The incvitable result of this must have heen to change the river systems from what they now are, and to create in the north a gigantic river, draining an area of over one-third of the entire continent of North America and forming a drainage hasin seven times as large as that of the St. Lawrence.

The central portion of the great river was in the middle of what is now Hudson hay, as proved hy the existing depressions of land in the north of Canada and the great depth of the center of Hudson hay. Its lower part discharged through what is now Hudson straits, into Davis straits. It is also maintained that the upper half of the St. Lawrence hasin, hoth in preglacial times and also at a later geological period, discharged its waters northward hy way of what is now Hudson hay. It is asserted that this constituted one of the main branches of this great northern river. Other hranches were the present Saskatchewan, the Nelson river, which rises west of the Rocky mountaius, the Churchill, largely augmented by the reversal of some of the upper rivers of the Mackenzie hasin, and great tributary streams that come down the present Churchill inlet, Fox channel, and Ungave hay, any one of which must have fully equalled in size the Mississippi of our own day.

ONE of the most remarkahle features of earthquake pulsations is their great duration. The originating earthquakc may last but a few seconds, while the ground at a distance may rock gently through a small angle for hours.

LAKE SUPERIOR is in danger of losing its distinction of being the largest fresh-water lake in the world. African explorers hegin to think Lake Victoria Nyanza is larger.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.
Crocker Building, Rooms 201, 202 and 203, San Francisco.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address, Golden King M. Co., Alleghany City, Sierra Co., Cal.

ALMARIN B. PAUL, M. E.,
ROOM 58, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.

Will act as AGENT for the sale of RELIABLE Mining Properties or the procuring of suitable Machinery for Interest in Developed Mines.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.
Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

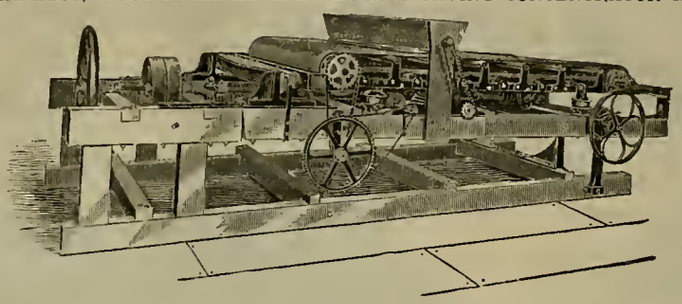
Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE ..... $350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 29, 1895.

Silver varies little in price. The chief attention continues centered in copper. The advance of electrical development has largely increased the demand for copper wire. In December of last year lake ingot copper sold at 9¼ cents a pound. Our New York quotations to-day are 12¼, and there are predictions of a further advance. It is said that copper can be mined and sold in New York at 6 cents a pound.

The Calumet & Hecla Copper Company of Michigan is reported to have made a sale at 12c for delivery up to Novemher 30th of 10,000,000 pounds. Copper was £47 on the 20th, an advance of 5s in three days.

Forty million pounds of copper is the reported annual product of the Boston & Montana mine. It is laid down in New York at a cost of 6 cents per pound. With 12 cents for electrolytic copper, this would make 6 cents per pound profit and annual earnings of $2,400,000, equivalent to 9 per cent on Boston & Montana stock if hought at $150 per share. But the output can he increased easily to 60,000,000 pounds per annum and with continued demand the temptation will he strong to increase it. This would add another million dollars to Boston & Montana earnings.

As to iron and steel, the Cleveland correspondent of the *Iron Age* of New York recently embodied the following in his market report: "The steel market is in a condition that hrings joy to the heart of the manufacturer. Buyers only ask to be protected in their purchases. 'An old maid book agent could sell steel to-day,' said the agent of a leading concern, Tuesday. 'The market is in a splendid condition; workingmen and their employers are near together and wages are going to he hetter a little later on.'"

Mining Share Market.

SAN FRANCISCO, August 29, 1895.

Stocks were slow in the early part of the week, particularly the Middle group, but improved considerably since Wednesday, Challenge, Confidence, Crown Point, California, Norcross, Chollar, Belcher, Potosi, Curry, Union, Ophir, Savage, Jacket, Occidental, Nevada, Andes, Bullion and Alta all advancing. Exploration work west on the 1100-foot level on tbe Con. Va. is being pushed. The three inclines will have sufficient depth hy the 15th prox. to admit of crosscutting on the Brunswick vein. Messrs. Lyman and Messer were on the Comstock during the week looking at the Concordia and Monte Cristo claims on the Brunswick, which the Ophir and Mexican think of huying, and made a report thereon, which will he considered hy the directors at their next meeting.

The following illustrates the changes of the week:

Power Transmission by Compressed Air.

In an article in last week's issue prominent notice was made of the new plant being put on Massachusetts hill, Grass Valley, Cal., for the North Star Mining Co. In connection therewith the Pelton Water Wheel Company have under construction a wheel for that mine of such extraordinary dimensions as to merit a brief description.

The wheel is 18 ft. in diameter, weighs 10,500 lbs., and is to develop 250 H. P., running under 750 ft. head, at 110 revolutions, and is to be directly connected to the shaft of a Rix duplex compressor, compound tandem type, of same capacity.

The design of the wheel is original and wholly novel. From a cast-iron hub radiate 24 steel spokes, which are connected to a rim made up of angle iron properly shaped, having a slot for the buckets, which are bolted to the periphery, the strain being taken by four heavy steel truss rods.

The wheel is made of this large diameter for purpose of giving proper speed to the compressor under the high head available. The water is applied to the wheel through a variable nozzle controlled by an automatic regulator, which will maintain a uniform speed on the wheel, with a variation from full load down to 25 per cent of same, affording by this means the greatest possible economy of water.

The power thus furnished is to be carried to the mine of the North Star Company, some 2000 feet from the power station, to run the hoisting works, mill and other machinery connected with the operations of that company.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time

Notices of Recent Patents.

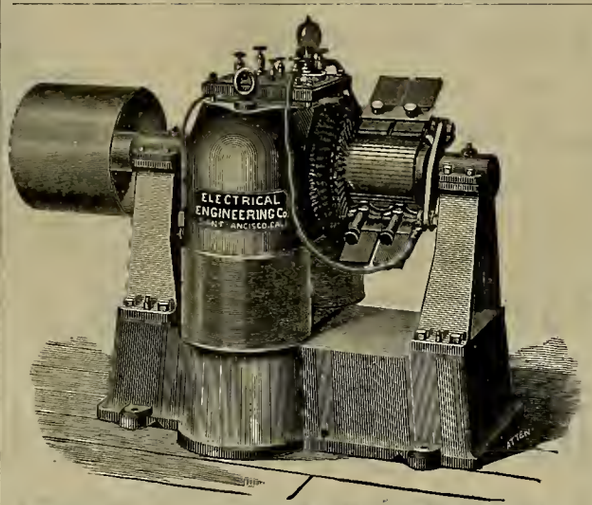
Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONTINUOUS FLOW SYRINGE.—Frank Terramorse, San Francisco, Cal. No. 544,014. Dated Aug. 6, 1895. This invention consists of a syringe having a chamber connected with its discharge end and provided with a nozzle whose area is less than the passage through which the liquid enters the chamber. A spring-actuated plunger is fitted into the chamber and has a hollow rod connecting directly with the discharge of the syringe and also with the chamber, so that the plunger will be forced inwardly against the power of its spring by reason of the accumulation of liquid in front of it, while the spring constantly reacts against the plunger and exerts a continuous pressure on the liquid, thus producing a continuous flow from the nozzle.

BICYCLE NAME-PLATE.—Charles W. Vosmer, Oakland, Cal. No. 544,524. Dated Aug. 13, 1895. This invention relates to a name-plate and a convenient means for attaching it to the frame of a bicycle. It consists of a sheet of metal made of any suitable form, preferable longest in the central portion and in the direction of the length of the bar to which it is to be attached. The opposite edges are folded inwardly, approaching each other so that the plate will fit around the desired bar. In conjunction with this is a tapering key having its edges turned inwardly, adapted to interlock with the inwardly turned edges of the plate, and when driven in, it clamps the plate upon the frame so as to hold it firmly in place.

PROCESS AND APPARATUS FOR MAKING GUNPOWDER.—William C. Peyton, Santa Cruz, Cal., assignor to the California Powder Works, San Francisco. No. 544,517. Dated Aug. 13, 1895. This invention relates to the treatment of explosives which, at a certain stage of manufacture, are in a plastic or semi-plastic condition. The object of the invention is to convert this mass into grains or pellets suitable for use in various kinds of fire-arms and cannon. It consists essentially in forming the plastic mass into a tube by forcing it through a hole around a rod or mandrel, then cutting the tube open along one side, parallel with the axis, separating the edges to form the cylinder into a flat sheet, then passing the sheet thus formed between grooved rollers whereby it is cut into parallel strips of geometrical cross-section, with intermediate uniting films, and finally passing it beneath a vertically reciprocating cutter whereby the strips are cut into grains.

PAPER CAN.—Geo. H. Bartlett, San Francisco, Cal. No. 544,525. Dated Aug. 13, 1895. This invention relates to an improved method of manufacturing paper cans. It consists of forming the body of one piece, with the leaking edges joined together along one side by means of U-shaped channel strips, the bases of which abut so that the strips are approximately flush with and form a continuation of the edges, and means for uniting the top and bottom of the can to the body, consisting of thin strips of bendable metal rolled in an S-form in transverse section so as to form oppositely facing channels to receive the end of the can body, while the outer periphery of the metal strip projects upwardly around the outside of the opposite channel to receive the head which rests upon the metal between the two channels, the projecting edge being bent or clamped over the end so as to lock it to the body.



BUTTER BOXES.—R. A. Simpson, Ferndale, Cal. No. 544,997. Dated Aug. 20, 1895. The object of this invention is to provide such an improvement in butter boxes as will dispense with exterior cleats, and will provide a simple, non-projecting fastening for the cover when closed and hinges so constructed that they will not become destroyed by the corrosive action of salt and will have a freedom of motion. It consists of a box having a strap bent at right angles at the upper edge and a cover having a strap extending below its rear edge with a slot in this portion through which the strap upon the box passes, the lower projecting end of the cover strap being movable within the channel or groove formed interior to the strap which is fixed to the box. The fastening device consists of a strap or plate secured to the top of the box, bent at right angles, through the front, having an upturned end and a channel formed in the front of the box into which this end projects when the cover is closed, so that a sliding bar may be driven in to lock the end of the strap, all parts being inside of the outer surface of the box front.

FRASER & CHALMERS
CHICAGO, ILL., U. S. A. and
43 Threadneedle St., E. C., London, Eng.

Power, Mining, Milling, Smelting, Concentration and Leaching Machinery; Return Tubular and Water Tube Boilers, Corliss Engines, Jones' Mechanical Stokers, Hoisting Engines, Riedler Air and Gas Compressors, Riedler Pumping and Blowing Engines, Cornish Pumps, Roots Blowers, Copper Converters, Pyritic Smelters, Horseshoe Roasting Furnaces, Comet Crushers, Crushing Rolls, Stamp Mills, Shoes, Dies, Perforated Metals, Sectional Machinery, Huntington Mills, Frue Vanners, Bridgman Samplers, Concrete Mixers, Heavy Machinery and Mine Supplies. = = Write for Catalogues

Our facilities for the manufacture of heavy plate steel work, cylinders to withstand heavy pressures, etc., are especially good. We desire to bid on work in any of our lines, and will give information promptly and cheerfully, and quote as low figures as consistent with first-class work. We think we can meet your ideas both in quality and price.

Manufactured by COLUMBUS BOLT WORKS, Columbus, Ohio.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

Sending Pictures by Telegraph.

Readers of the MINING AND SCIENTIFIC PRESS have noted numerous references to a system of "sending pictures by telegraph," and numerous inquiries have been received as to how it was done, or how it could be done.

There are two or three methods. In our opinion the most intelligible way is that recently copyrighted by W. H. Lowd, train dispatcher for the Northern Pacific Railroad at Duluth, Minn., herewith illustrated and described in outline. It is simple, easily understood, and practicable in any locality where tolls are at all reasonable.

Supposing, for instance, a journal in San Francisco wants to reproduce, for to-morrow morning's issue, the picture of some one who has in some way got himself or herself into temporary prominence to-day in Los Angeles or Denver or Portland. A cipher chart, similar to that herewith shown in Fig. 1, is before the operator and artist in the sending office and the receiver in the San Francisco office. The photograph or drawing or sketch to be transmitted is enlarged or reduced, as may be found necessary, by means of a pantagraph on the chart, which consists of a sheet of paper on which are ruled 476 little blocks, each about a quarter of an inch square, each of which are subdivided into nine minute blocks or squares, somewhat of the general appearance of a 40-mesh screen. These blocks are numbered from one to nine. Across the top and bottom of the chart are letters designating and referring to the 476 blocks, and on the sides are similar designations, the system of reference being readily understood. Either the letters or the words can be used, though in long-distance telegraphic transmission words are more conducive to accuracy. Where lines pass between the squares fractions are used to indicate the direction. The little diagram in the upper left hand corner of Fig. 1 shows the manner of fractional division. Where corners are required every square through which the curve passes is designated. Blocks that require shading are so mentioned and the color of different blocks also designated, though for rapid work nothing but outline drawing is practicable. Every line and curve can be closely reproduced by the little squares and described by the cipher dispatch giving the two dimensions.

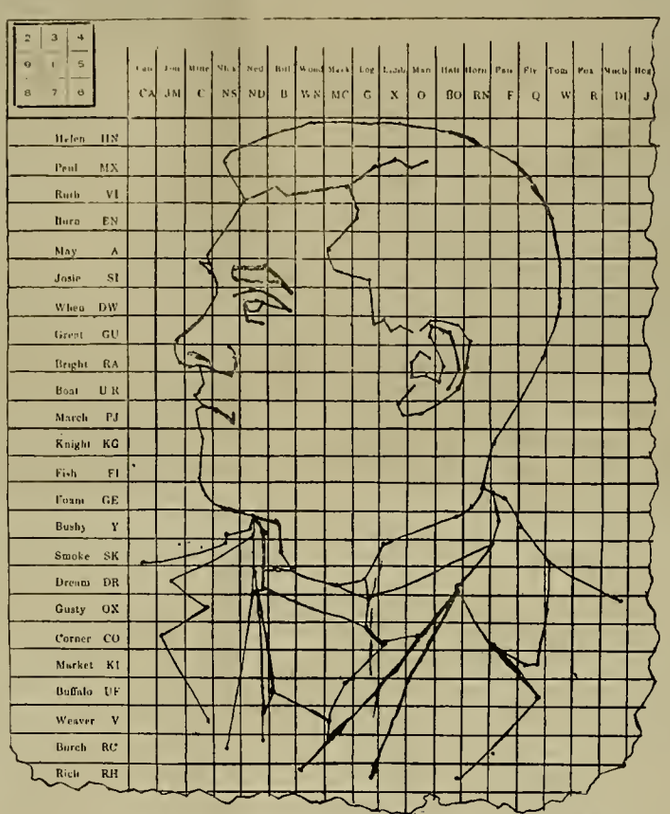

FIG. 1. — LOWD'S CIPHER CHART FOR SENDING PICTURES BY TELEGRAPH.

Let us suppose, then, that the picture of some one in a city 1000 miles from San Francisco is to be sent here by telegraph to-night for re-production in to-morrow morning's paper. The chart shown in Fig. 1 is in the telegraph office. The sending operator sends the following cipher message, which reads like a ridiculous mass of words:

From Ruth Ned 8 "To" May mine 6 Josie Nick 8 when Nick 2 great mine 3 great Jim $\frac{6}{7}$ bright Jim $\frac{5}{6}$ bright mine 8 7 boat mine $\frac{1}{4}$ $\frac{7}{8}$ March mine $\frac{3}{4}$ $\frac{1}{3}$ knight mine $\frac{3}{5}$ fish mine 7 foam mine $\frac{3}{5}$ foam Nick $\frac{7}{8}$ bushy Ned 3 $\frac{1}{3}$ bushy Nick 7 smoke Nick 3 smoke can 7.

Hair cut close on back of head and neck. Hair parted and combed forward and up.

The operator at the receiving office has a similar chart, and follows with a pencil the instructions sent over the wire as above. The receiver keeps his pencil on the paper till he gets the word "from," which indicates a new starting point. He goes on without removing his pencil from the paper till "from" is ticked out, when he begins on the square indicated, and so on. "To" is understood, and is not used. The cipher message printed above is what would be sent in transmitting by telegraph the picture herewith presented. The figures closing some of the printed paragraphs, "$\frac{2}{3}$, 6, 5," etc., when they thus follow each other, are the ones in the block last indicated by words. When he has finished he hands the chart, which then looks just as Fig. 1 does on this page, to the newspaper artist who fills in the sketch, reduces it, puts it through a rapid process, and in a few hours the paper appears with the picture as in Fig. 2, which in this case is a faithful likeness of Mr. Lowd, the inventor of the system here described. Of course, the whole thing is, necessarily, somewhat crude. Like the dog dancing on his hind legs, the wonder is not that it is not done well, but that it is done at all. By skill, accuracy and close attention on the part of the sender and receiver, it is possible to instantaneously transmit a faithful reproduction of any ordinary-sized picture.

Fig. 1 on this page shows the present state of the process. The cut is not as fine as the elaborate and costly engravings that usually appear in this paper, but is presented as illustrative of what can be done in "sending a picture by telegraph," and how it is done.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Lowd's Cipher Chart for Sending Pictures by Telegraph; Perfected for Printing, 149.
EDITORIALS.—Sending Pictures by Telegraph, 149. The Quickest Mail Time from Europe; "The Relative Cost of Producing an Ounce of Silver and an Ounce of Gold;" Engineers' Fees; Letter of Colorado Stock Broker; Uranium; Increase in the World's Annual Gold Yield; Fakirs at the Miners' Convention; Labor Unions "Boycotting" National Bank Notes; Report of Broken Hill Proprietary Co.; Taxation of Mines in Mexico, 150. Miners' Association at Spokane, Wash.; Problems in South African Mines, 151.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 154.
SCIENTIFIC PROGRESS.—The Production of Cyanides; Copper as a Conductor; Large Refracting Telescope; Total Heat Value of Coal Utilized in Engines; Tides in the Atmosphere; To Divide the Clock into Ten Hours, 256.
MECHANICAL PROGRESS.—The Heilman Locomotive; Trouble From Oil in Boilers; One Hundred Miles an Hour; Caisson Foundations; The Eight-Hour System; A Novel Flying Apparatus, 156.
ELECTRICAL PROGRESS.—A New Thermo-Electric Apparatus; The Use of Electricity in Connection With the Bessemer Process; Electrical Carriages; Test of Electricity on Canals; Electric Railroad in Cape Town, South Africa; Litigation Between Electrical Companies; Steeling Copper Plates; First Application of the Three-Phase Long Distance for Electric Railway Work, 157.
PRACTICAL INFORMATION.—Not Luck, But Pluck; The Work of the Mississippi; The Canal System of France; The Platinum Output; Preparing Tools to Keep From Rusting; Novel Test of Electric Power; Argon and Helium; Death by Fall Painless; The Rei of Brazil; Ingots of Gold and Silver as Coin, 157.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 162.
MISCELLANEOUS.—Concentrates; Personal, 151. South African Gold Fields; Hollow Steel Shafting; The Mines of Amador and Calaveras, 152. Critical Periods in the History of the Earth; Composition of Minerals; The United States Coast Survey; Samples of Ore from South Africa; Clouds and Sunshine in California; Books Received; The Center of Population, 153. The Mechanics' Institute Exposition; The International Correspondence Schools, 155. Coast Industrial Notes, 162. Notices of Recent Patents, 163.

THE quickest mail time ever made from Europe to San Francisco was last week's receipt of letters here ten days from Queenstown. It seems incredible that a letter should he carried across the Atlantic ocean and across the American continent—nearly 6000 miles—and delivered at one's residence here in ten days' time, hut such is the fact.

"THE relative cost of producing an ounce of silver and an ounce of gold," about which so much has been written hy monometallic financiers, has additional interest now attached hy reason of evidence furnished in the workings of Colorado and Utah mines where gold is produced cheaper than silver. Such facts like the discovery of silver in sand upset all former theory and fanciful argument.

ENGINEERS' FEES are sometimes as large as lawyers' fees. In the parliamentary inquiry into the feasibility of the Manchester Ship Canal project, the late Capt. Jas. B. Eads was paid $50,000 for his expert testimony. Prof. E. A. Fuertes, of Cornell, who is superintending the rebuilding of a portion of the City of Santos, Brazil, on a sanitary hasis, is to receive as his fee four per cent of the total outlay, which is estimated will be $4,000,000, making the professor's emoluments on this one "joh" $160,000.

A COLORADO SPRINGS, Colorado, stock hroker, sends us his weekly letter, which opens in a deliciously sarcastic vein. He says: "Everything pertaining to the mining stock market for the past week has heen satisfactory to those of conservative views." It is a good deal like the expert who recently visited a promising mining property in one of the northern counties of this State, where everything was being run on the proposition that one should never do anything to-day that could he put off till to-morrow. His report was that the management was "too conservative."

URANIUM is reported found in considerahle quantities at Columbine, a new Colorado camp. The published accounts of the find do not agree with the general characteristics of that rare metal which is of value and in use in the manufacture of uranium glass, in coloring porcelain, in photography, etc. Its high cost has prohibited its use in other branches of manufacture. In '90 it was quoted at seventy-five cents per gram; in '93, one dollar; in '94, two dollars. The atomic weight of uranium is 240; its specific gravity 18.7. The salts of uranium are what is used in the commercial processes ahove mentioned. Pitchhlende, in which uranium occurs, has heen found in this State, South Dakota and in Gilpin Co., Colorado, one deposit in the Wood Lode, in the latter locality, heing found particularly rich in that heautiful metal.

Now that the date for the annual convention of the California State Miners' Association is announced, there will probahly appear the usual fakirs with their "souvenir," "official programme," etc., to beg and coax merchants and manufacturers of mining machinery and supplies to take advertising space therein. Every year this ohtaining of money under false pretenses is repeated, the wonder heing that any shrewd, intelligent advertiser can for a moment suppose that any such publication can do him one cent's worth of good in any way. He and his competitors in the same line of husiness may see a copy of the few dozen printed, hut no possible customer will ever see it; or, seeing it, will pay the slightest attention to it. It is an annual swindle, and deserves no more consideration than that accorded to any other mendacious mendicant.

LABOR UNIONS and other organizations are reported "hoycotting" national hank notes, refusing to take them for goods or services. As an indication of their feeling toward the national hanking system such action is in some localities a popular form of emphatic protest. The Government is pledged to redeem the national hank notes, and this one potent fact militates against any "hoycott" or refusal to receive them for merchandise or lahor of any kind. It is not a constitutional question. The national organic law recognizes gold and silver alone as money. The issue of the national hank note, like the issue of the "greenback," was duly authorized by Congress, and the legality of such action upheld hy a Supreme Court decision. The uational bank notes are not legal tender for private ohligations, hut as they are readily redeemahle in money that is, any refusal on the part of any one to accept them simply involves some confusion, annoyance and delay.

IN the general determination of the South African gold companies to reach deeper levels come the usual prohlems; among them ventilation and safe and speedy means of exit and entrance for the men. These prohlems are being discussed in the South African and European mining journals, and will, douhtless, be satisfactorily solved. Some of the statements elicited will seem crude to Pacific coast miners, who long since successfully overcame the same difficulties confronting the South African gold miners in deep mining. Just now the published statements regarding ventilation largely amount to elahorate calculations of the increase of the temperature of the earth at depths of 1000 and 2000 feet, etc., and the prohable amount of heat generated hy oxidation of sulphurets. While such subjects are of scieutific interest, it is probahle that the managers of the mines in question will be more inclined to take into account the amount of heat and foul air generated hy and emanating from several hundred hearty men in a deep mine than ahstract prohlems of pyritic oxidation and earth temperature. Regarding the securing of swift and safe means of egress and ingress it is also likely that considerahle advance in ideas will he made from the present status of the discussion, wherein it is gravely stated that "men cannot he expected to go up and down 2000 or 3000 feet of ladders." The California miners on the Randt, whether in charge as superintendents, managers, foremen, shift hosses or any other capacity, can give practical points from experience and ohservation that will quickly dispose of such primitive ideas regarding getting in and out of a deep mine. They can tell of hoisting works on deep mines in California, Nevada and Montana, where thirty-five men on a douhle-deck cage can with safety he hoisted out at the rate of 2400 feet in a minute. Such speed has been common in mines on this coast for the last twenty years, whether for ore cars or men, and the quality of machinery used, and the skill of those in charge, have reduced the possihility of accidents to a minimum.

Taxation of Minerals in Mexico.

Consul-General Crittenden reports to the Government from Mexico regarding the recent change in that country's revenue laws regarding the taxation on gold and silver products, the full text of which was puhlished on pages 350 and 351 in the issue of the PRESS of June 1st, '95.

It has heen suggested that this measure may he construed as an export duty, and would perhaps invoke the action of the United States by retaliatory legislation next winter. Secretary of the Treasury Limantour of the Mexican repuhlic says it is not intended to act as an export duty, hut as a necessay measure for internal revenue.

Each Mexican state has the privilege of securing, and does so secure, a large part of its revenue by imposing an "extraction tax" on ores. The new federal tax amounts to 5 per cent of the value of the silver and gold, it being deemed expedient to collect the tax on the ores when they are centered at the various metallurgical establishments, or, if destined for export, at the port of exportation.

To prevent mixing up the federal extraction tax with the state extraction tax, the Mexican government decided to change the name, collecting it partly as a stamp tax and partly as a coinage tax, to be collected internally. The exact method for the collection of the tax is not yet puhlished, hut it is thought prohahle that the government will establish revenue officers in all large mining districts and at the most important smelting works in order to collect the tax internally on the ores, whether shipped from their point of original production to the local smelter works or shipped to points of export.

From what may he termed the contemporaneous exposition of the law, it cannot he considered an export tax, as its scope is not confined to the silver and gold exported in the form of silver hullion, hase bullion or ores, but is also levied on all silver and gold contained in ores, which are reduced locally, and which are taken to the mint for coinage. A coinage tax of approximately five per cent is as old as the country itself since the time of the conquest, and the object in view under the new law is to make all the silver and gold produced in the country enter under the same conditions and pay the same tax which has always heen paid hy such silver and gold which has been treated in the country and introduced into the mints for coinage, therehy materially increasing the revenue.

The law has occasioned great interest in Mexico; and while it may apparently affect Americans holding concessions and rights in their smelting and mining operations, yet it will ultimately he visited upon the heads of those engaged in the daily operation of extracting the ores from the mines. If the metallurgical estahlishments which pay the tax upon the bullion and copper matte which they export should succeed in transferring the burden of the tax to miners from whom they supply themselves with ore, then it is evident that, although the smelting works estahlished in Mexico may not suffer to any appreciable extent, the tax must become an additional hurden on mines and mining interests. In this sense it would affect, to a greater or less extent, those already engaged, or intending to engage, in mining operations in Mexico.

The law went into effect on July 1, 1895, and calls for a tax of 3 per cent as a federal stamp tax, and 2 per cent coinage tax, aggregating the 5 per cent. From the 3 per cent tax there are no exemptions made hy the law in favor of any one, or for any purpose. From the 2 per cent coinage tax there is hut one exemption, viz., smelters operating in that country (generally American enterprises) under concessions granted them hy the Mexican government will not pay the coinage tax on the silver contained in their lead hullion if the assay value of such hullion does not exceed seven-thousandths, say 204 troy ounces per ton; the coinage tax will not be paid on silver coined in copper matte shipped hy such smelters unless the assay contents exceed twenty-thousandths, say 503 troy ounces per ton. In case these limits are exceeded, hoth the stamp and coinage tax must he paid on the excess. The gold contents of hoth the hullion and matte must pay the full 5 per cent tax.

Mr. Crittenden gives credence to the helief that should our Government have any underlying idea of

a protective effect of the new law which is not apparent, and reimpose the duties provided for by a former law, then the object of the Mexican government to make it an export tax, should such an object exist, would be accomplished more fully by such action on the part of the United States, without the odium of an exportation tax attaching to the Mexican government.

A CIRCULAR signed by sixty-two mining men is received, announcing intention to organize a miners' association at Spokane, Wash., to include Washington, Idaho, Montana, Oregon and British Columbia, the first general meeting to be held on October 2 and 3, when permanent officers and committees will be chosen, the organization to be styled The Northwest Miners' Association. The expressed intent of the organization is commendable. Intelligent cooperation and mutual support will be of benefit to the mining industry throughout the region named. Some British Columbia journals have seen fit to say that the idea is solely to form a union of mine owners and that the ultimate object is to put down and keep down the price of labor. It is probable that this statement is actuated by that singular hostility to all things American constantly manifested by our northern neighbors who, whether in mining or any other pursuit, seem to deem it necessary to carp at and decry anything and everything that emanates from the United States. It is for the creators of this new organization to see that such ill-natured and premature criticism shall have no just cause for existence. The mining industries of the Northwest need just such an institutiou as that proposed for protection and development, and will find plenty to occupy the earnest attention of all its members. Prices, whether of labor, material, or anything else, are matters that settle themselves and cannot be successfully dealt with by any association or organization. Development of the mineral resources of the country, resistance to corporate encroachment, securing friendly and suitable legislation, diffusion of latest and best methods of mining, circulation of up-to-date mining knowledge, concerted efforts to advance mining interests in general, are among the legitimate aims and intents of the proposed organization, and its life and efficiency will be in direct proportion to the honesty, zeal and intelligence with which these and matters of kindred intent are treated.

THE semi-annual report of the Broken Hill Proprietary Company, L't'd, of Barrier Ranges Silver Field, New South Wales, for the half year euding May 31, '95, is received. It is an elaborate publication, containing the directors' report and detailed reports from the general manager, the mine manager, the chief metallurgist, the superintendent, etc., severally, with schedules, balance sheet and statements of account, auditors' report, with working plans, etc. As the biggest "goiug" silver mine, its report is of interest. In the two years ending May 31, '95, this property has produced 13,678,341 ounces of fine silver, 10,829 tons lead and 8425 ounces of gold. During the six months ending May 31, '95, 11,687 tons of bullion treated produced 3,773,539 ounces fine silver and 2914 ounces gold. The report every half year shows a decrease in cost of productiou. For the last half year each ton of ore treated cost £2 11d: the previous half year £2 3s 7d, which was a reduction on the cost during the half year preceding that. The net profits for the six months of which the report treats were £344,760 7s 8d.

THE increase in the world's annual gold yield attracts universal attention. In '92 it aggregated 7,041,822 fine ouuces; in '93, 7,662,077, an increase of nine per cent; in '94, there was an increase of 26½ per cent on the figures of the preceding year, the yield being reckoned at 8,781,014 ounces. It is estimated that the world's gold yield for '95 will aggregate 9,800,000 fine ounces, an increase of twelve per cent over the yield of '94, or over forty per cent over the yield of three years ago. Of this, the United States is expected to show a total product of 2,200,000 ounces, Australia and Africa the same, and other countries 3,200,000. At $20.67179 per fine ouuce, the estimated gold yield of the present year will add over $202,000,000 to the permanent wealth of the world.

Concentrates.

THE gold receipts at the Denver Mint for August aggregated $335,144.77.

BUTTE, MONTANA, is now producing copper ore at the rate of 2,000,000 tons per annum.

A MILE of tramway iron was received at Oroville last Monday for the Golden Summit mine.

THERE are 250 men employed at the Iron Mountain in Shasta Co. The force will shortly be increased.

VIRGINIA, NEV., papers say 'tis useless for idle miners to go there expecting work on the Comstock.

A 100-TON smelter is to be built at Trail Landing, B. C., and is expected to be ready for treating ore by Nov. 1.

THE owners of the Mountaineer mine, Nevada City, will sink their shaft 400 feet deeper. It is now 800 feet deep.

THE Leiter Mining Company of Sheridan, Montana, are about to build a 20 stamp mill seven miles from Sheridan, a tramway, ore houses, etc.

THE Columbia River Hydraulic Mining Co. is about to put in a $100,000 mining plant on Smith creek, near Revelstoke, B. C.

THE Nogales *Oasis* publishes a report that five million dollars have been offered for the United Verde copper mines and refused.

THE output of the East Helena, Montana, smelter for 1895 is estimated at $3,000,000. Three hundred men are given employment there.

THE Cariboo, B. C., Hydraulic Mine's ditch, at Quesnelle Forks, is seventeen miles long—one of the largest in the world. Water was turned in last week.

THE Detroit Copper Mining Company is putting in a new pipe-line between their pumping plant on the river and their reductiou works at Morenci, seven miles.

THE antimony mine near Kingston, Idaho, has closed down. But seven cents per pound could be got for the product, and under the system of extraction that didn't pay.

SILVER is reported discovered in Ohio, but not at a political convention. Alleged silver ore was found by well diggers this week at Canal Dover, at a depth of 145 feet.

IT is believed from comparison of approximate estimates that the gold production of the United States for the first eight months of '95 is considerably over $30,000,000.

THE number of stamps in present operation in the Witwatersrand, South Africa, district is 2745. In this State the number is estimated to be slightly in excess of 3000.

A CONTRACT for running the Butte Basin tunnel at Mokelumne Hill has been let to L. Record of San Andreas, patentee of the saw machine recently described in these columns.

INCLUDING freight duty and original cost, Liverpool salt is landed at Vancouver, B. C., for $10 per ton. The freight from Vancouver to Nelson over the Canadian Pacific Ry. is $13.16 per ton.

THE rehearing asked for by Alvinza Hayward, the Hobart estate and the directors of the Hale and Norcross Mining Company, in the Hale and Norcross case, has been denied by the Supreme Court.

IN the last week the Webber group of mines at Lakeview, Idaho, on Pen d'Oreille lake, has gone into the hands of a receiver, and the principal mine buildings have been destroyed by an accidental fire.

ACCORDING to the Folsom *Telegraph* the guards of the prison put in their idle time mining in the river, which is quite dry above Rohher's ravine. It is said they make their cigar money by a few minutes' work each evening.

THE Phœnix *Herald* says the Premier Extracting Company, which is working the tailings of the Vulture mine above Wickenberg, Arizona, are handling fifty tons of the tailings per day and extracting 90 per cent of the gold.

FIFTEEN THOUSAND pounds of silver were shipped by Wells-Fargo to San Francisco from the City of Mexico last Saturday morning, under the escort of two special messengers. The money is intended principally for Oriental export.

SOME specimens of contorted slate from the quartz vein of the Mahoney mine at Sutter Creek, Amador Co., from twelve to twenty inches thick and unconnected with the walls of the mine, have been received at the State Mining Bureau.

THE report of the Rohinson Gold Mining Company of South Africa, for the six months ending June 30, '95, shows an ore product of 81,376 tons, which produced 72,129 ounces gold, the gross value of which was £259,508, an average of £4 13s 3d per ton.

THE Homestake mine at Rossland, B. C., is now in the hands of a corporation—the Homestake Gold Mining Company—stocked for $500,000. The Homestake mine was one of the first located in Trail Creek. Men are now working on a tunnel and shaft.

A PARTY of five practical prospectors are exploring around the eastern and northeastern base of Mt. Shasta, on the assumption that somewhere under that lava-capped area will be found a spot where erosion will give chance to determine if gold exists beneath.

G. G. GARVIN of Oro Grande writes that the recent statement published so extensively of startling developments in the gold fields of Oro Grande district is entirely false; that there are no new finds whatever in that district, and that only one man is employed at the Carbonate mine.

SINCE the passage of the new Montana law requiring mining corporations to pay a fee of $5.50 for each thousand dollars subscribed capital, the mining companies incorporated in that State are not inclined to pay from $1000 to $1500 in official fees, and the capital stock is placed at a very moderate figure.

CONTRADICTORY REPORTS come from Arizona about the Harqua Hala mines in which a rich discovery was lately reported. The Arizona *Republican* says: "From a gentleman who just came from Harqua Hala, it is learned that the mines have closed down and that the cyanide plant only is at work on the tailings."

THE silver smelter at Great Falls, Montana, will start up in the next sixty days. A contract has been completed with the Moulton company at Barker to ship the accumulation of lead ore which has been piling up on the dump for some time, and the silicious ores of Neihart are again being shipped to the Falls.

SAN BERNARDINO COUNTY SUPERVISORS propose a system of sign-boards, guide-posts and other land-marks for the 15,000 square miles of desert in that county, so that prospectors and others will be less likely to wander and die of thirst. A hundred poor fellows have lost their lives in that region in want of just such a system as is now proposed.

THE new survey of the boundary line between California and Nevada will give this State some hundred square miles. Nevada also gets a slice of California, but California has the advantage by a few hundred square miles. The mining camp of Sylvania, which heretofore has been right on the boundary line, will be in Nevada, the same as other contiguous mining camps.

AT last Monday's meeting of the California Debris Commission permits to mine were granted to the owners of the Corkscrew mine near Spanish Ranch, Plumas county, and the Willow placer mine near Sierra City. Permits to erect impounding dams were granted to the owners of the Cascade mine in Plumas county and the Eureka hydraulic mine near Placerville.

A BULLETIN by the Geological Survey of the production of lead in the first six months of 1895 shows a total of 106,000 tons, of which 88,000 were desilverized lead and 18,000 soft lead. Seventeen thousand five hundred tons of this were refined in bond, the remainder being obtained from American base bullion. The total is an increase of 3500 tons over the first six months of 1894 and 6000 over 1893.

THE *New Northwest* says more men are employed in the mines of Butte than ever before in its history. The payrolls of all the big companies are the largest ever known, and more money is being deposited in the banks by laboring men than at any period since Butte became the greatest mining town of the world. Every smelter in the district is taxed to its full capacity and leasers are thereby required to wait for weeks for returns. Intending leasers are scouring the hills of the district for promising copper properties and everywhere there is hustle and activity. It will be the greatest year in Butte's history.

AT the meeting of the Anti-Debris Association at Yuba City last Saturday, the officers of the society alone were present. President C. E. Stone read his annual address, in which he discussed the DeGuerre Point dam and the question of continuing the association. The appointment of Commissioner Kidder and his drawing a salary was denounced and the secretary was instructed to call Governor Budd's attention to the matter. It was resolved to continue the orgauization. C. E. Stone, T. B. Hull, B. F. Walton, Robert Millar and G. W. Hutchins were elected directors. They organized by electing C. E. Stone president, B. F. Walton secretary and G. W. Carpenter treasurer.

AN advertisement is now running in an Eastern paper calling for 500 men to work grading the road in Sixteen-Mile Creek canyon, near Toston, Montana. The advertisement states that "the wages paid is $2 per day, less $5 per week for board. Supplies are furnished by the company on the ground. Payments are made for labor in time checks, which are secured by first mortgage bonds on the railroad. These checks can be sold at 75 cents on the dollar, but they are worth more, and will doubtless be paid on the completion of the road." Probably to an Eastern man this is an alluring offer. It is not hard to figure out how the man who accepts the offer will find himself in debt at the end of his period of labor.

THE following from the *Alaska News* is to the point: The papers in all mining districts are urging miners to contribute mining items for publication in their columns. Miners should heed such appeals, as they will find that a majority of the mining items appearing in their local papers are copied in the metropolitan journals. The miner should understand that although his local paper may have a somewhat limited circulation, it also has an exchange list, through which well-written articles reach thousands of readers all over the world. The press is friendly toward mining interests, and, too, does not overlook Alaska, and no charges are made for publishing facts about the progress of mining enterprises.

JAS. R. MORSE, a San Francisco mining man, has taken into partnership the King of Korea, and will work the Khusan gold mines in that country, about 180 miles from Seoul. Morse is to employ the men, buy the machinery, pay all demands out of the proceeds of the mine, pay his royal partner one-fourth the net profits and keep the rest himself, the partnership to continue twenty-five years. If half what is told of the richness of that Korean gold district is true, Mr. Morse has a good thing. In his concession is also the privilege of employing American miners and importing American-made mining machinery free of duty, and any property acquired by Americans in Korea in connection with the enterprise is not to be taxed. In case the requisite capital is forthcoming and the mines turn out well the matter is of considerable importance.

THE Canadian nickel mines at Sudbury, Ontario, raised 112,037 tons of ore last year, of which 87,916 tons were smelted. The ore only contains a small percentage of nickel, however, so that the amount of the nickel contained in this large quantity of ore was but 2570 tons, which was accompanied by 2748 tons of copper and some 3½ tons of cobalt. The cost of producing the nickel matter from the ore is heavy. It is crushed and then roasted, which gets rid of some of the sulphur. Smelting is effected in water-jacket furnaces, the charge containing eight tons of roasted ore to a ton of coke, the result being a matte containing some fifteen per cent of nickel. This matte is not usually refined in Canada, but is exported as it stands. The Vivians, however, Bessemerize the matte, raising the contents to forty per cent of nickel before exporting it to Wales. Other processes of reduction are being experimented with, among them an electrolytic process, which is, however, handicapped by the tariff on the acids required.

Personal.

ERNEST L. RANSOME, well and favorably known here in connection with the Pacific Stone Co., has organized the Ransome Subway Co., in Chicago, to manufacture a jointless pipe of concrete for sewer and water pipes, electric conduits, etc., with headquarters in the Monadnock block.

South African Gold Fields.

A region that in '94 produced almost as much gold as the United States, and promises to yield $50,000,000 in gold in '95, is of interest to Californians and Pacific coast residents. France and England have taken extraordinary interest therein and have made extraordinary investments. The sudden prominence in the mining world of the region around Johannesburg is one of the wonders of the century. The one district known as the Witwatersrand, in the Transvaal republic, is, so far as its productive area is concerned, not over fifteen miles wide and about sixty miles long, and ten years ago it was laid out in stock farms that were selling for so much or so little per acre. To-day the mines located upon this narrow strip have a London market value of $150,000,000. And, as here some years ago, men who a short time ago hardly possessed a dollar are to-day worth millions. Cecil Rhodes is said to be worth $40,000,000. His friend and associate, Alfred Beit, of the firm of Wehruer, Beit & Co., as much more; J. D. Robinson, of the Robinson mine, $35,000,000; Henry Nourse is quoted at $15,000,000; F. A. English the same; and Piet Maraes, $10,000,000.

Californians are prominent there. Hamilton Smith, Hennen Jennings, Gardiner Williams, John Hays Hammond, L. S. Seymour, T. H. Leggett, and twenty others are directing big enterprises at princely salaries.

The city of Johannesburg is a "boom" town, in many ways unlike Virginia or Pioche, Butte or Leadville, Deadwood or Denver. It is a city of 40,000 from all nations, but governed by a slow Dutch Board who keep down all the usual accompaniments of a "wide open" mining town, except stock gambling, which is an element they cannot control.

The discovery of the auriferous blanket or conglomerate beds on the Witwatersrand was just ten years ago. In 1885 $50,000 would have bought all the farms of the entire district. Single claims have since sold for three times that. The news of the discoveries soon reached Kimberley, and it was mainly the Kimberley crowd which took hold and developed the mines. The deposits were found in a shale, unlike anything else anywhere in the world. They are not in quartzite veins, but in associated beds of a sort of conglomerate which is reef-like. The main reef is about 1200 feet wide, and the principal workings have strung along for eleven miles.

It was on account of the peculiar geological character of the formation and the unexpected presence of gold in a conglomerate bed that at first led even expert engineers to declare the fields worthless. One celebrated engineer, sent out at heavy expense, pronounced the alleged find an absurdity. From the very reef on which he stood millions of dollars worth of gold have been taken out.

The deposit is in a bed that takes the shape of an enormous bowl. The same deposit will be found at a deep level some miles away from the outcrop of the reef. The English law is that a claim extends into the earth on vertical lines and not according to the "strike" of the vein, as in the American system. So, knowing that the vein could be tapped at a distance, an American engineer, Hennen Jennings, conceived the idea of sinking a long shaft at a distance from the main reef. This was the beginning of "deep level" workings, and from these many of the richest mines have been and are now being developed.

When the Rand was first opened up a town was forthwith established right on top of the reef, but when later it was found that underneath the streets and stores were valuable beds of gold, the Government opened up a townsite a little distance away, selling the lots at auction, or rather selling ninety-nine-year leases. These yielded a large sum, and have since increased enormously in value. This was the beginning of Johannesburg. When the town was first laid out all the supplies and machinery for the mines had to be brought from the seaboard, and for 300 miles of the distance were carried in ox wagons. By the end of 1892 the Cape Town railroad was built in, and now two others have been completed through. The mines extend along the reef from some miles in either direction, and their big crushers and the chimney stacks of the engine houses stand out against the horizon. The mines are equipped with immense stamp batteries and these, with the great furnace houses, the chlorination and cyanide works, with the adjacent reservoirs of tailings and of slimes, following one after another over the grassy depths and rises of the country for miles and miles, present a scene unparalleled in any part of the world.

At the Witwatersrand the output of gold has increased at a greater ratio than the crushing capacity of the various mines, which is accounted for by improved processes. In June, 1892, when the gross production was 103,252 ounces, the number of stamps at work was 2035, while in July, '95, when the output totaled 200,941 ounces, the stamps numbered 2745. In June, '92, the amount of gold recovered from tailings by means of the cyanide process was 15,722 ounces; in July, '95, it was 54,446 ounces. In June, '92, the total recovered from the battery was 82,395 ounces, being at the rate of 40.48 ounces per stamp. The amount obtained from the batteries in June, '95, was 132,016 ounces, or over 48 ounces per stamp. This increase in the productive power per stamp—the more remarkable in view of the fact that the average yield from the battery has fallen from 9.92 dwts. per ton in June, '92, to 9 dwts. last month—is explained by the improved machinery now in use. By the employment of heavier stamps, usually 1050 pounds, the production of the mills has been materially increased. In June, '92, the average duty per stamp was 3.14 tons per day; in June, '95, the average had risen to 4.12 tons per day. In January, '95, the average was as high as 4.23 tons per day; at one particular mine—the New Primrose—the daily average is regularly over 5 tons, and at other mines, like the Robinson, Crown Reef, Durban, Roodepoont, etc., the average is almost that. In June, '92, 2035 stamps crushed 158,351 tons of ore, being at the rate of 77.81 tons per stamp for the month; in June, '95, 2745 stamps crushed 290,000 tons, or 105.64 tons per stamp for the month. These figures show the enormous strides which the Rand gold-mining industry has made in mechanical and scientific progress.

Further development of the fields is in progress. This month crushing begins at the first of the great deep-level mines, the Geldenhuis Deep, which will run 200 stamps.

The number of white workmen employed at the mines last year was, according to the official returns of the Chamber of Mines, 5652. Of Kaffir laborers the number employed last year was 40,504. It is estimated that by the end of the present year 60,000 Kaffirs will be required, with a proportionate increase in the number of white workmen. The average wage paid to white workmen at the mines is $26.25 per week. The working hours average 9.6 per day, or 57 per week.

E. P. Rathbone, mining inspector, has translated the Dutch official mining report for the year ending December 31, 1894, into English, from which it is learned that toward the close of the year 141 companies actually at work sent in statements.

The nominal capital amounted to £24,702,815; the issued capital amounted to £22,940,321; the working capital, inclusive of cash payments to vendors, amounted to £7,869,811, or 34⅓ per cent of the issued capital. The total amount of dividends paid out by all mining companies from the commencement up to the end of the year 1893 amounted to £3,503,867, or a sum equal to 20 per cent of the value of the gold production. The dividends paid out during the year 1894 amounted to £1,647,063, or a sum equal to 20.5 per cent of the gross value of the gold produced during the year, or 47 per cent of the total amount paid in dividends up to the end of the year 1883.

At the end of the year the total number of diggers' and prospecting claims held amounted to 62,489, an increase of 14,288 on the beginning of the year. A statement is affixed to the report, showing for the year the total expenditure of all the mines (64 gold and 24 coal) amounted to £6,153,410. The following recapitulation of the gold output of '94 is given:

	Ounces.	*Value.*	*Per cent of total output.*
Free gold (mill)	1,457,103	£5,243,707	68.4
Tailings	694,625	2,091,730	27.3
Concentrates	84,471	318,909	4.1
Alluvial	3,666	12,806	0.2
Total	2,239,865	£7,667,152	100.0

During 1894 the total number of white workmen employed in the industry was 5653, and of Kaffir workmen there were 42,504. This is an increase of 1404 whites and 12,253 natives over the previous year. These persons extracted from the ground 3,489,015 tons of ore, and, taking them all round, their average productive value works out at £160 per head. The State Mining Engineer then passes to consider particularly the Witwatersrand gold field, including Johannesburg, Boksburg, Krugersdorp, Florida, Koornkop and Blaauwbank. These fields have produced nearly 88 per cent of all the gold produced in the State, and at the end of 1894 the total area held under mining rights amounted to 88,775 English acres. During the year the number of claims increased by 14,034 prospecting and 439 diggers'.

ENGINE BUILDERS now employ hollow steel shafting for electric railway power houses, made from an ingot which is cast in a vertical mold about twice the diameter of the finished shaft. The lining of this mold is perforated. While the metal is fluid it is subjected to a hydraulic pressure of 7000 tons, which remains on it until the ingot is cold. This process of fluid completely prevents blow-holes and cracks, and makes the metal practically homogeneous. Sufficient is cut from this ingot to forge to the length of the proposed shaft, and a hole the size of that in the finished hollow forging is bored through it. The piece is then reheated, and a mandril the size of the finished hole is run through it. It is then forged out to the necessary length under presses varying from 7,000 to 14,000 tons pressure. The steam hammer is not used in any of this work, as the blow is apt to produce only surface impact. After the forging is finished, it is placed in an annealing furnace, heated and allowed to cool slowly, thus relieving it of all forging strains.

The Mines of Amador and Calaveras.

Interview with SENATOR E. C. VOORHEIS by Special Correspondent.

Senator E. C. Voorheis, of Sutter Creek, California, recently passed through San Francisco on his way home from Alaska. While he had many incidents to relate about his trip and the beautiful and grand ice scenery of Alaska, still he held that mining in California was far ahead of any other place, and especially mining in Amador and Calaveras and along the mother lode generally.

On the Yukon river, after many difficulties, the miner has only a short season in which to work—at the greatest, three months—and then the snows begin and the ground becomes ice-bound, and the prospector lays in stores for the long winter, at, generally speaking, '49 prices. Some of the large quartz mines are so low grade that expensive plants have to be erected, much beyond the means of ordinary mining development companies. Such a mine and plant is the Treadwell mine at Douglas Island.

In South America also, although labor is cheap and correspondingly poor, transportation of material and supplies cost much more.

Mr. Voorheis had a letter from Mr. Woakes of London, general manager of the Darien Mining Co., at Cana, U. S. of Colombia, inquiring prices of acids needed in chlorination, and incidentally mentioned common salt (which product was controlled by the Government) as being quoted at ten cents per pound.

Most of the material needed by the Darien Mining Co. would have to be transported by coast steamer from Panama and afterwards by long journey on pack mules for many miles through a tropical roadway from the coast to the mines in the interior of Colombia.

Why should capital seek investment in these far-away places, where chances of success are much more doubtful than at home?

There is no mining man who, in a conservative mood, imagines that the craze in the London and Paris stock markets about South African securities is likely to continue. As yet there is no mine in South Africa where the chances of development in depth are to be compared with our own Utica and Kennedy mines and the mines of the Grass Valley district. Indeed, it is difficult to conceive any area in the world more extensive or more favorable for quartz development than this same mother lode mining region, which extends from Nevada county through Placer, El Dorado, Amador, Calaveras, Tuolumne and Mariposa counties.

Many accounts have been written of late about old abandoned mines being reopened, which cheap, modern methods of mining and saving sulphurets make profits now certain. A dozen years ago these mines could not be profitably worked. And again, it is only of late years that any great development in depth has been attained by the mother lode mines. In the larger dividend-paying mines the end of the pay shoot is not reached at even 2000 feet in depth.

Referring particularly to Amador and Calaveras, it is understood that the Plymouth mine is under bond for sale abroad. The North Gover, near Amador, is being opened by Col. Trumbo, of Salt Lake City, and others. At or near Sutter Creek, the Mechanics is under bond to Valentine & Co., and the Wildman & Mahoney is being worked by Bostou capitalists.

The Central and South Eureka companies are also preparing to begin work anew, while the Amador Queen, owned by English capital, will also soon begin work. The Kennedy, at 1950 feet, continues a big dividend-payer, and the Argonaut, immediately adjoining, yet to be heard from. The Zeile pays well, with very low grade ore.

Across the river Mokelumne, and in Calaveras county, activity is centered in the extreme south and extreme north, along the lode.

The Utica mine, in the south, will probably soon repair the damage from the recent fire and remain clearly in the lead in California mines, while the Gwin mine will probably be heard from when the crosscut from the 1000-foot level is run to strike the vein, north of the old works. The Utica-Stickles is credited with a monthly output of over $500,000.

Mr. F. F. Thomas, mining engineer, is in charge of the new Gwin Development Co.

The two properties immediately south of the Gwin, and known as Gwin Extension No. 1 and Gwin Extension No. 2, have been bonded from McSorley Bros., of San Andreas, by Mark B. Kerr and San Francisco capitalists for $30,000, and exploration and development work will be begun in a few weeks.

Between the Gwin and Utica many prospects exist, which will probably be exploited at no distant day sufficiently to show that capital is safe to invest in them.

All this is pleasant to see, and to know that capital invested in a good prospect in the deep mines of California, where conditions, locality, water, power, fuel and good surface rock exist, will handsomely reward the investors. So let us say, "Why invest abroad when chances so good exist almost at our door?"

Critical Periods in the History of the Earth.*

By JOSEPH LE CONTE, of the University of California

NUMBER II.

CRITICAL PERIODS.

The thesis which I wish to maintain, then, is that there have been what I have elsewhere called "critical periods" in the history of the earth, *i. e.*, periods of very general readjustments of the crust of the earth, and therefore of widespread change in physical geography—so great and so general as to affect profoundly and widely the climates of the earth; that these physical changes in their turn gave rise to still more marked changes in organic forms, and finally that these changes together form a rational basis for the primary divisions of time.

These great and comparatively rapid changes in organic forms are produced in the following ways: 1. The changes in physical geography open gateways and permit migrations in many directions. 2. The changes in climate, besides their direct effect on organism, compel migrations mainly north and south. 3. These migrations in their turn precipitate different faunas and floras upon one another, producing severe struggles between invaders and natives, and therefore the destruction of many forms of both, and large modification of the survivors. 4. The foreign invasion compels many natives in their turn to migrate, and so the wave of invasion, of severest struggle, and of consequent changes is propagated as far as physical conditions will allow migration. The effect of all this must be a more rapid rate of evolution of organic forms, as the result (*a*) of a new environment, and (*b*) of a severer struggle for life. The more rapid rate of evolution, and especially new opportunities give rise to higher dominant classes. These higher dominant classes again in their turn determine changes in lower forms, especially their immediate rivals, and these changes are again propagated downward through the whole organic kingdom and compel a new adjustment of the whole on a different basis.

The great theater of physical changes, of extensive migrations, and of severe struggle, and therefore of rapid evolution, especially of higher forms, and therefore also the place of first appearance of dominant classes has undoubtedly been what Huxley calls Aretogæa, *i. e.*, North America, and Eurasia north of the Himalayas and Sahara, or all the northern hemisphere north of Central America, Sahara and the Himalayas. This, the greatest body of contiguous or continuous land, has in later geological times been sometimes united, sometimes divided. It has been subject to the greatest changes, the widest migrations, the severest conflicts, and therefore the most rapid evolution of dominant forms. But these dominant forms have from time to time, as opportunity offered, invaded more northern lands, and always as conquerors.

Signs of Critical Periods.—The greatest revolutions are marked in the rocks (1) by widespread unconformities, and therefore by a loss of records which is greater in proportion as the unconformity is more general. But since unconformity always means eroded land surface, widespread unconformity must mean greatly enlarged eoutinents or a continental period between two comparatively oceanic periods. (2) They are marked by great, very general and apparently sudden changes in organic forms, affeeting not only species, hut also genera, families and orders. (3) By the introduction of new and higher dominant classes. (4) By the birth of great mountain ranges. Of these characteristic signs the most general and important is the change in organic forms. This is, therefore, the most important means of determining the primary divisions of time, hut the other signs are usually concurrent and are therefore confirmatory. The secondary divisions are based on less general changes, and are therefore themselves more loeal in their application.

It must not he imagined, however, that these great revolutions of the earth's crust are catastrophic, in the sense of heing instantaneous. On the contrary, although they were periods of exceptional commotion, they continued probably hundreds of thousands of years. Nor were they simultaneous everywhere in any mathematical sense. On the contrary, the changes were douhtless propagated from place to place until readjustment was complete; so, also, and still more certainly, the changes in organic forms were propagated from place to place hy migrations and conflicts as already explained. Therefore the line of delimination hetween the primary divisions will not he drawn at exactly the same horizon in all places.

I wish now to show that there have been several such critical periods, or periods of very great changes affecting the whole earth, and that they form a rational hasis for primary divisions of the geological record, applicahle to all parts of the earth. I begin with the last; not hecause it is the greatest, for it is indeed in many respects the least, hut because it is the nearest to us and therefore the clearest, and on this account may he expected to throw light upon the real nature of such periods. I shall call such periods critical periods of revolutions.

1. THE GLACIAL REVOLUTION.

The Drift or Quartenary or Glacial Period, or Ice Age, I am couvinced constitutes one of these critical periods and the last. I have called it the Glacial Revolution.

The cause of the glacial climate we shall not discuss. Whatever it be, whether geographical or astronomical, or both, it is certain that it was attended with great and widespread oscillations of the earth's crust hy elevation and depressions in all high latitude regions. The greatness of these oscillations we are only beginning to understand. The North American continent, for example, was certainly raised at least 3000 feet and probably much more. The continent was enlarged until the shore line advanced to and even beyond the submerged continental margin. In Europe the elevation was equally great. It is prohable, also, that the southern hemisphere was similarly affected nearly if not absolutely simultaneously. From the distribution of organic forms in the southern hemisphere there seems much reason to believe that the Antaretic continent was elevated and enlarged until it connected with and connected together the point of South America, South Africa, Australia and New Zealand. The effect of these great changes in physical geography would be to produce corresponding extreme changes in climate and wide migrations of organic forms, partly permitted hy changes in physical geography and partly enforced hy changes of climate. These migrations extended not only throughout Arctogæa, but also southward into all the southern contiuents except Australia. Madagascar and the coast islands of California seem also to have escaped. These great changes, as already explained, determined a more rapid evolution of organic forms, especially among the higher animals.

This, then, I helieve ought to be regarded as a critical period, and therefore a dividing line hetween two primary divisions of the earth's history, viz.: the Cenozoic and the Present. The Present, therefore, contrary to the view of most geologists, I regard, and insist on it, as a primary division of time, and the glacial period as the transition of critical or revolutionary period separating it from another division, the Cenozoic.

I so regard it hecause it hears all the marks of a primary division of time. 1. There is widespread uncouformity of present sediments on all previous strata. This is seen in old river heds, in the deposits of great glacial lakes, and in all the sea margin deposits as far as the submerged continental margin. In addition to this, if we admit the great enlargement of the Antarctic continent already mentioned, the unconformity extends over the whole Antarctic ocean hottom. If to all this we add the unconformity of the drift itself on its eroded hedrock, surely the wideuess of this unconformity is scareely inferior to that of any other critieal period. Very much of this is now concealed heneath the ocean hy subsequent subsidence of land. 2. There are here, also, very great and rapid changes in organic forms, especially among mammals. The change in the mammalian species since the Tertiary, *i. e.*, during the Glacial Revolution, is complete. In lower forms the change as yet is less complete than in previous critical periods. I said as yet heeause it is still going on rapidly. 3. There is here the introduction of a new and higher dominant type, man. I must stop a moment to enlarge on this.

(*To be continued.*)

*Bulletin No. 11, of the Department of Geology.

THOSE eugaged in mining have frequent need to know the composition of a mineral, or to ascertain its compositiou from a given formula. The process is simple, but unless one is constantly iu practice, it is easily forgotten. For instance, take the mineral galena, which has a simple composition of lead and sulphur comhined in proportions governed by nature's unchangeable laws. The formula of galena is PbS, or lead and sulphur comhined according to their atomic weights. The atomic weight of lead is 206.4; that of sulphur is 32. The following is the process to ascertain the percentage of each element: The atomic weight of lead is multiplied hy 100 and the sum divided by the 238.4, the total atomic weight of the two elements in the mineral. This will give the percentage of lead. The percentage of sulphur is obtained in the same way.

THE United States Coast Survey was estahlished by Congress in 1807 upou the recommendation of President Thomas Jefferson. Active operations by the Survey did not, however, commence till 1817, but were almost immediately interrupted hy want of funds. It was not until 1832 that Congress made a liberal appropriation for the fund, and then all existing charts had become so inaccurate as to make the navigation of our coast extra perilous.

SAMPLES of ore from South Africa, from the Langlaate reef, Johanneshurg are conglomerates, one heing a hrown surface oxidized ore running $18 and nearly all free milling, while the other is grayish iu color and of a sulphide nature running $14 a ton. The concentrates after amalgamation run $76 in gold.

Clouds and Sunshine in California.

The average percentage of mean cloudiness and sunshine hy seasons, with the average uumber of clear days, are as follows for the Weather Bureau stations named, and are deduced from the monthly charts issued by the United States Weather Bureau, Washington, D. C.:

STATIONS.	Mean cloudiness, percentage of	Mean sunshine, percentage of	Average number clear days	Mean cloudiness, percentage of	Mean sunshine, percentage of	Average number clear days	Mean cloudiness, percentage of	Mean sunshine, percentage of	Average number clear days	Mean cloudiness, percentage of	Mean sunshine, percentage of	Average number clear days
Eureka ...	48	52	12	50	50	12	28	72	21	36	64	33
San Francisco	47	53	35	33	57	38	13	57	29	35	65	12
Los Angeles..	34	66	49	44	56	36	31	69	39	25	75	54
San Diego	39	61	37	49	51	36	46	54	24	37	63	38
Red Bluff. ..	45	55	38	38	62	42	12	88	81	22	78	70
Sacramento ..	37	63	39	31	69	52	07	93	85	18	82	68
Keeler.....	26	74	60	24	76	61	12	88	70	16	84	74
Fresno	45	55	31	31	69	51	07	93	85	15	85	65

It will be noticed hy the ahove table that during the winter season Los Angeles and the interior of California south of the Tehachapi range of mountains has a greater percentage of sunshine than does the portion of California lying north of the above named mountain range, excepting Keeler, which has the greatest percentage of sunshine at all times except the summer season, when Sacramento and Fresno have the same amount, while Red Bluff is the same as Keeler. The latter (Keeler) has a greater annual percentage (80) of sunshine than any other portion of the State, as well as more clear days.

The interior of California, in the Riverside region and surrounding sections, has a very high percentage of sunshine, equally as much so as is reported from Sacramento.

There is no record of cloudiness at Riverside that has been regularly and continuously tabulated for a numher of years past, and for this reason the exact percentage of mean cloudiness and sunshine cannot be given, but enough is known of that region to he safe in claiming a higher sunshine percentage than any other portion of California south of the Tehachapi mountains, excepting the desert region between Salton and Yuma and Barstow and the Needles, where it may average somewhat higher and prohably equals or exceeds the record of Keeler, which place shows an average of 80 per cent of sunshine annually and an average annual number of 274 clear days.

Riverside, during the winter season, has a greater percentage of sunshine than does the Sacramento and San Joaquin valleys, and equals those valleys in spring, summer and autumu.

Books Received.

"*The Mineral Industry: Its Statistics, Technology and Trade,*" *Vol. III, 1894, edited by R. P. Rothwell.*

The third volume of this annual compendium is fully up to the just expectations of those who found in the first and second volumes of this work so much of practical value to appreciate and approve. On receipt of the second volume this journal spoke in cordial endorsement and sincere praise, and can now only repeat what was then said. The third volume of nearly 800 pages is accurate, thorough, truthful and comprehensive, and besides elaborate statistics and up-to-date information on matters mining and metallurgical has many valuable monographs on different matters directly connected with the mining industry from specialists in the several lines treated. It is published by the Scientific Publishing Co., 253 Broadway, New York; price $5.00, postpaid.

"*Gravitation and Cosmological Law, a Mathematical Demonstration of the Secret of Gravitation and Attendant Phenomena,*" *by M. F. Singleton; from the Franklin Printing and Publishing Co., Atlanta, Ga.*

The author says that the object of the work is to show that all the laws of gravitation which have been determined empirically, or by observation, can be deduced independently of any inherent attraction which one body may be supposed to have for another; that is, that regardless of the existence of matter or the attributes of matter gravitation can be demonstrated as a pure mathematical proposition. There is in his book considerable that is new, and a little that is good. For a mathematician he "assumes" and "imagines" too much, and as a theorizer his figures are made to assume the usual pliancy. It is difficult to understand what even the author himself considers when he imagines "all space filled with a saturated solution of matter," and any one who would seriously "imagine" such a singular state of affairs would probably find satisfaction in the serious contemplation of the tangible effect of a chimera revolving in a vacuum.

"*Hot Water Heating, Steam and Gas Fitting,*" *by Jas. J. Lawler.*

This is a 284-page octavo, written by a practical man who knows what he is talking about and tells a great deal in a plain, simple way about hot water heating, steam heating and gas fitting. A great deal in this book has been told before, but never in such a way as to be more plainly intelligible and of greater direct practical benefit to the men who put up and attend to the fittings and appliances of which this book treats. Considerable of it is in relation to conditions that do not exist in California or on this coast, hut there are very few pages in this admirable work that would not be found of practical value to any and every builder, maker or user of gas, steam or hot water fittings. The book is published by the Excelsior Publishing House, 26 City Hall Place, New York City; price, postpaid, $2.

BY the census of 1890 the center of population was in latitude 30 deg. 11 min. 56 sec. and longitude 85 deg. 32 min. 48 sec., at a point a little west of south of Greeusburg, the county seat of Decatur county, Indiana. Between 1880 and 1890 this center moved westward about forty-eight miles and northward about nine miles.

Mining Summary.

CALIFORNIA.

Amador.

GENERAL NOTES.—*Republican*: Work preparatory to hoisting the water from the shaft is being pushed ahead on the Good Hope. Just below the mine on the margin of the creek, an excavation has been blasted into the side hill to admit of a ten-foot breast wheel. To this wheel the water on the south fork of Jackson creek will be conveyed by means of a flume extending over 300 feet up the creek. The flume is ten feet above the ordinary bed of the creek, and to get water into it a dam has been built that height, which will raise the creek bed that height by the deposit of tailings from the Zeila mine, backing the water some 500 or 600 feet.

At Amador Queen No. 1 the shaft is free of water to the bottom 100 feet below the tunnel level, the tunnel being 40 feet from the surface.

At the Anita a contract is let to run 300 feet of drift, 200 feet north and 100 feet south.

The Reward mine has shut down temporarily. The mill is running on some custom rock, and when this is crushed it will close until the ditch can be repaired to get in water. This will take about five weeks to accomplish. The payment of the balance on purchase price becomes due in October. There is little doubt that the purchase will be completed at that time.

At the Argonaut they are building a foundation for an air compressor for the purpose of inaugurating machine drilling in the near future.

Calaveras.

THE FORD MINE.—At the Ford mine the intention is to sink 200 feet, and then a crosscut will be started.

El Dorado.

THE CANYON CREEK PLACER MINE.—*Gazette*: A company of Eastern capitalists have been prospecting this mine, about three miles north of Georgetown, with a view to buying it, and have recently had surveys made for the purpose of locating the lines and extending it to the river. The tailings from the Georgia Slide and Oregon Canon mines lodge in Canon creek and have been accumulating there for years, and working them over ought to pay well. If this claim is properly opened it cannot be other than a paying property. The price asked is said to be $25,000.

Kern.

AMALIE DISTRICT. — (Special Correspondence): There is considerable prosperity in mining circles nowadays. Mr. A. Sauser the superintendent of the "Brogan" is pushing work as rapidly as possible and taking out some fine ore.

The Amalie Mining Co. expect to have their new hoist in operation in a few days, having completed their raise to surface making a shaft 250 feet deep. As soon as the hoist is ready they expect to begin sinking from the 250-foot level.

Work is being pushed on the "Picnic," a contract having been let for sinking. Since the work was begun there has been some very fine ore taken out.

The Dull brothers have put on a night shift and are sinking on the "Mayflower" with all possible speed. They have good prospects and it is thought that depth is all that will be required to increase its richness.

Mr. J. B. Gault has discovered and located a claim showing some very nice ore.

Mr. Brooks, a mining expert of many years standing, is giving this country a thorough inspection. This is the kind of people the Amalie district likes to see, for her mines and formations will bear the closest inspection.

There is being considerable assessment work done and a number of good leads have thereby been opened up.

Mr. F. D. Lanterman, Deputy U. S. M. Surveyor, discovered a lead and located a claim which joins the Occidental on the southwest and thus it is that new leads are being discovered within a very short distance of our richest mines. This shows that our country has never been thoroughly prospected, this lead being within a five hundred feet of the boarding house and mill of the Amalie Co.

Considerable excitement was caused among the miners here when it was ascertained that Frank Dean, who had been so long in the employ of the Amalie Co., was under arrest for stealing ore; it also put mine owners on the lookout and a watchman was placed on both the Amalie and Occidental mine.

Messrs. Young, Foster and Parker struck ruby silver in a claim recently located. This is the second mine in the State from which this character of ore has been taken—the Amalie, from which this district takes its name, being the first. G. E. F.

Mariposa.

MERCED G. M. CO.—The Merced Gold Mining Co. is building a dam across Black Creek, above the old 49 mill to get sufficient power to run a stamp mill at the Potosi mine.

Placer.

ANOTHER "LOST MINE" FOUND.—The lost "Emigrant mine," about twenty miles east of Cisco in Placer county, has at last been found, after a search of five years. The ore body is very extensive and is reported to go $200 per ton.

San Bernardino.

SOLD HIS INTERESTS.—A. G. Tingman of Holland & Tingman has sold his interest in mines in the Pinon district, including a half interest in the Pioneer mill for $25,000. That mine is now running on ore from the Lost Horse mine.

MINES BONDED.—Isaac Reed, E. E. Rowell and Judge A. Brunson have bonded the Sweden mining claims, in the Virginia Dale district, three miles south of the Virginia Dale mine, to San Francisco miners, for $10,000, to run 30 days.

At the Rose mine they are down 400 feet with a bigger body of ore in sight than ever before. The ore which is shipped runs $260 to $300 per ton. Dr. Shugart, the superintendent, expressed the opinion that they were now below the breaks and the ore hereafter would run more even. The low grade ore milled at the mine runs about $30.

Lewis and Townsend's mine, a half-mile from the Rose, though a small property, shows up well. Metcalf, in Rattlesnake canyon, cleaned up $400 in bullion on a 30-days run with one horse and an arrastra.

In Holcomb Valley, Upper Holcomb, Gold Mountain and Morongo King, everything is flourishing. The mountains are full of prospectors, there being more men at work than ever before known and all of them feel encouraged.

HOLCOMB VALLEY MINING CO.—At the Holcomb Valley Mining Co's mine the steam shovel and 30 men are at work sluicing rich gravel which pays for the first time in the history of the company.

San Diego.

THE GOLDEN CROSS.—E. M. Browder, the representative of an English company, is again reported making overtures for the purchase of the Golden Cross mine and its entire plant. This is the same mine for which it was reported $2,500,000 was offered by another syndicate of English capitalists and refused about a month ago. It is thought a sale of the property could be effected were it not for a fear of legal complications. The new 100-stamp mill of this mine will be working this week which, with the present mill, will make 140 stamps in all.

Shasta.

THE MOUNTAIN MINING COMPANY. — *Free Press*: It is a good sign when on going along the street one can see tacked upon a post the sign, "One hundred men wanted." We have so long been accustomed to see one hundred men or more wanting employment, that we are rejoiced that the tables have been turned. This is the result of the operations of the Mountain Mining company. It is estimated that the company would expend a million dollars before they turned a wheel to produce bullion. Increased activity is noticed all along the line, and the McCormick-Saeltzer company keep the road lined with teams hauling freight from their large establishment. Men are being put at work as fast as accommodations can be provided. The new town started on the Skillen ranch has been named Keswick. Here the survey stakes have been set for the smelter and work is well along on the two-story and a half boarding house. Grading for the railroad is progressing rapidly, there being several camps located and graders at several points.

It is stated that at the mine the company are running a tunnel of large propositions, large enough in fact to permit a railroad train to enter. This really is the purpose contemplated, in order to load the ore on the cars and carry it to the smelter the road will be a narrow gauge; from Keswick to Bull's bar three rails will be laid to permit the hauling of broad gauge cars with a narrow gauge engine.

The expert and general manager, Mr. Hill, has been traveling over the county in search of silicious ores to be used in smelting. From one source we learn that he has met with good success; others state that he has not found as large a quantity as he had hoped and of sufficient value. Joseph Bell informs us that the ore required must have a value of at least $10 per ton, while others state that ore going above $4 will be purchased. Mr. Bell expects to make a contract with the company to furnish fifty tons of ore per day.

Elias Ellery has been getting out some very rich ore at his mine above French Gulch, and will start his Huntington mill Monday and expects his usual good cleanup.

Ellery, Filman & Co., at Trinity Center, are erecting a mill. Wm. Stevens is doing the work. Their tunnel is in 125 feet showing a three foot ledge, 18 inches of which assays very rich.

James Salee has secured a bond on the Bully Hill mine at Copper city, and will put sixteen men at work there immediately. He will run two tunnels, one 300 feet long and the other 700 feet long. Rails, cars, etc., have been shipped by wagon. He will erect a boarding house and make preparations for a long siege. The tunnel work will be let by contract. When he gets ready to take out ore he will haul it to the smelter which the Mountain Mining company propose to erect near the mouth of Spring creek. The formation is quartzite on the foot wall and stratified slate on the hanging wall.

NEVADA.

ESMERALDA COUNTY.

SILVER STAR GOLD BELT.—Silver Star is situated about eight miles west of Soda Springs, a station on the Carson & Colorado railroad, some forty miles south of Hawthorne, in Esmeralda county. The mines lie on the north side of Messiah mountain, and are in Douglass mining district. The country rock of the district, says Dan De Quille in the Salt Lake *Tribune*, is trap or diorite on the north side of the mountain, and it is in this formation that the gold veins are found; on the south side limestone is the prevailing formation, with a strong syenite belt running parallel with and between the limestone and the diorite. The gold-bearing veins run east and west and the syenite appears to form the foot wall of the whole mineral belt. The mountain itself is a huge one, and the only one in all that region that was heavily timbered.

The mountain rises to a height of 8800 feet above sea level, and the mines are situated on its slope at an altitude of from 6500 to 7100 feet. All the veins are well defined and vary in width from two to twenty feet. The vein material is a friable calcite. In this gold is found in the free state and containing a very small per cent of silver.

The mines yield near the surface from $120 to $150 a ton and at the east end of the system there are seven veins lying from 300 to 400 feet apart. These veins seem to converge at a point about a mile west, where on a ridge the vein is thirty feet wide on the surface, the surface material assaying from $9 to $12 in gold and about 80 cents in silver. At depth this large bulge is liable to contain a bonanza of great size.

As the strike of the several veins of the system is east and west some are of the opinion that they are feeders of a big mother vein that has a north and south course and still lies undiscovered in the heart of Messiah mountain. Most of the experts, however, are opposed to this notion, and assert that the mines are situated on genuine and permanent lodes. All the leads, both great and small, on which development work has been done have all the earmarks of well-defined, independent veins, and their walls are smooth and regular.

Although the majority of mineral veins have a north and south course, there are many instances of very rich east and west veins and systems of veins in all parts of the world. North and south seems to be the natural course of main mineral-bearing lodes, but they are in many places found to have been so far swung out of that direction as to lie squarely east and west. In mountain ranges there not infrequently occur kinks or twists in which a considerable section may be so far turned aside that any veins contained in it will be seen to lie at a right angle to the course of the main range. Portions of mountain ranges may have been turned aside from the general course by some great convulsion of the earth or crowded out in the form of a "kink" by the shrinkage of the earth's crust.

In the Great Basin region the mountain ranges run north and south, and the dykes and belts of rock of which they are composed follow the course of the ranges, as do the main veins of quartz. This is the rule, but as stated above, there are places where there are twists in the ranges. The general course of a rope thrown loosely upon the ground may be north and south, but in places sections of it will lie east and west. There are similar kinks in mountain ranges whose blocks of many square miles are "slewed" round out of the general course.

There appears to be a twist of this kind at Silver Star. Thus we find on the south side of Messiah mountain a limestone formation, with a strong parallel belt of syenite, while on the north side of the mountain lies a diorite formation. As all of these big belts of rock lie east and west, it is but natural that the quartz veins should also run east and west. In the vicinity there have been great upheavals and convulsions. At the time when the gold-bearing veins were formed they and the big syenite dyke, with the other belts of the formation, may have had a north and south course out of which they were afterward twisted by some great disturbance that turned the big mountain half way round on its base. It is easy to understand how the shrinking of the crust of the earth might cause such kinks in a mountain range. In that way might be produced at great depth some peculiar "faults" not easily discovered.

On the several veins thus far discovered in the camp, many claims have been located, and already about a dozen of these are paying well, while others are fast being opened and developed.

OREGON.

THE BONANZA MINE.—Baker City *Democrat*: The Bonanza mine yesterday sent in a gold retort worth over $5,000, the result of thirty days run with five stamps.

BRITISH COLUMBIA.

CARIBOO DISTRICT.

THE CARIBOO DITCH AND MINE.—From tables published in this paper showing the duty of water per inch, the *Mining Journal* calculates regarding the new Cariboo ditch — really a canal instead of a "ditch" — that with an average of 2500 feet of water playing on the gravel of the Cariboo mine, about 10,000 yards per 24 hours will be moved. The results of the wash up will naturally give confidence in others interested to develop and prove properties. In a comparatively small section of country where primitive methods were used, Cariboo shows already an output of $40,000,000 in gold.

ALASKA.

AN IMPARTIAL OPINION.—Dr. George F. Becker, geologist in charge in this division of the United States Geological Survey, has returned from Alaska, where he has been making a survey of the gold fields along the shore line, accompanied by Dr. W. H. Dahl. This is the first work that has ever been done by the United States Geological Survey in Alaska. In an interview with a *Call* reporter he said:

The first mines examined were the Sumdum and those near Juneau, the Douglas Island, Sheep Creek Basin and Silver Basin, and farther north those at Berners Bay. These all form a large belt up and down through Juneau. Then there were some undeveloped mines near Sitka. A peculiarity found worthy of note was the presence in the gangue both in the Juneau belt and about Sitka of magnetic iron pyrites, which is a comparatively rare mineral in gold mines.

Another peculiarity I found was a great abundance of chloride as a gangue mineral. It is not a mineral that is usually found in gold mines, although it is occasionally found in the gold mines in North Carolina and Europe. It has some interest as bearing on the genesis of gold ores.

Farther west there is some good property at Kodiak island, but only partially developed. Still farther west, at Unga island, is an important mine, second only to the Treadwell and Mexican, called the Apollo Consolidated. The ore is notable in two respects. It contains a large amount of free gold in an unusually fine state of division, so that at first sight rich quartz looks as if it had a yellow stain running through it like oxide of iron. Kidneys of this quartz with fine free gold give the value to the mine.

The other notable feature is that it contains a considerable amount of native copper, which is a very rare accompaniment of gold. Only one case of the kind has been reported in America, and that was in Virginia some fifty years ago. The Apollo Consolidated is turning out several hundred thousand a year.

I don't think there is much doubt that Alaska is going to be an active mining region, but I do not think that it will rival the California mining belt. The veins are not so large and well developed as they are here.

There has been quite an excitement this summer about the placers at the head of Cooks Inlet. The amount of success thus far achieved hardly warrants the amount of interest exhibited. The profitable washings thus far discovered are confined to a couple of miles on Bear Creek, which empties into Turnagain Arm. I think it proper to make this statement to prevent too much of a rush of people there who are not supplied with means to live on until they can find something or return. I did not visit Yukon. I learned, however, that there were a great many poor men stranded there unprepared with means, and a large proportion do not find gold. Any man who proposes to go into the Yukon country should carry along means to support him for a year at least.

IDAHO.

IN THE CŒUR D'ALENES.—Manager Bradley says he is employing 350 men. "Everything is working smoothly and to our satisfaction. Both the mine and the mill are running night and day, and we are shipping sixty tons of concentrates daily."

The Last Chance mine and mill are running at Wardner with a full force. It is employing seventy men and shipping twenty tons of concentrates daily. The Morning mine, at Mullan, is also to be started up on the same basis. The Hunter, at the same place, is also paying same wages and giving work to fifty men.

A BIG CONSOLIDATION.—The Tiger and Poorman mines on Canyon creek in the Cœur d'Alenes, consolidated last week, and will be worked under one management. The new company is called the Consolidated Tiger and Poorman Mining Company. Capital stock, $1,000,000, divided into 1,000,000 shares, 500,000 shares going to the stockholders of the Poorman and 500,000 to S. S. Glidden, the owner of the Tiger. The capitalization of the old Poorman company was $5,000,000, divided into 500,000 shares. Every stockholder in the old company will receive share for share of the new stock in exchange for the old. The Tiger was never capitalized. Spokane, Wash., is named as the principal place of business. During the nine years the two mines have been operated they have produced $10,000,000. Both properties have extensive improvements, including concentrators, hoists, air compressors, electric plants, boarding houses, buildings, etc., costing in the neighborhood of $35,000. Both have valuable water rights which will now be consolidated and merged into one system. It is expected that this will reduce the fuel bill of both mines to practically nothing for the greater part of the year, and that this alone will effect a saving of $30,000 per annum. One mine will now pump out the water for both, one hoisting plant will also serve both mines, and there will be but one management, and it is calculated that in all a saving will be effected of not less than $6000 per month.

MONTANA.

GENERAL NOTES.—The old placer diggings near Virginia City, that had been simply drifted in the early days, are now being thoroughly worked by hydraulic methods and are yielding big money.

The Royal mill is to be started up again. About fifty men are employed on the property at present, which force will be increased.

The Eureka Placer Mining Company advertises for bids for the construction of a flume and ditch to supply water to their diggings. The estimated cost of the work is $7,500.

The Volcano Mining Company, in the Boulder district, is employing quite a force of men, doing considerable development work. This is a gold property and is said to be a fine prospect.

The Southern Cross mill is running steadily day and night on ore from the Keystone property. They are said to be doing well. Four heavy ore teams are hauling the ore from the mine to the mill.

The big Parrot canal is almost completed and the contractors are now at work near Point of Rocks, where the new smelter is to be built. The construction of the branch line of the Northern Pacific to the smelter site is being pushed rapidly.

The Easton mill, near Virginia City, has again commenced operations. New automatic dryers to treat silver concentrating ores have been put in and it is expected they will prove a success. The ores from the Easton mine are required to be put through a double process, first for the treatment of gold then for the silver.

SOME DIVIDEND PAYERS. — The following dividends have been paid by Montana mines from Jan. 1st. to Aug. 1st. '95.

Am. D. & M. Co.	$ 24,340
Bald Butte	12,000
Butte & Boston	300,000
Elkhorn	50,000
Hecla	105,000
Iron Mountain	80,000
Montana Limited	82,000
Moulton	30,000
Hope	10,000
Total	$693,340

ARIZONA.

HIGH GRADE SULPHURETS.—In Chaparral Gulch, Yavapai county, Ariz., a large body of ore was struck last week in the Blaine mine about 200 feet below the surface. It is reported as a high grade sulphuret ore. It has been drifted for twenty-five feet and promises exceedingly well. The vein is from 2½ to 3 feet of solid ore, about one-half of which is shipping rock.

The Mechanics' Institute Exposition.

The Mechanics' Institute of San Francisco and the MINING AND SCIENTIFIC PRESS are about the same age. In one of the earlier numbers of this paper is an account of the "first annual fair" of the Mechanics' Institute, and year after year are found in the files the annual notices of the chief industrial gathering of the chief city of the coast.

The 28th exposition is different in some respects from any of its predecessors. There are fewer exhibitors in some departments and more in others; there is a different system by which awards of merit will be made; there is a hint of "the new era" that is announced and the advertising element is in evidence throughout. The music, pictures, statuary, aquarium and "fine arts" are not supplementary, but take precedence, and the mechanical display is more suggestive of what it could be than complete.

A representative of this journal has spent some time in looking at the display on the first floor, and while many prominent manufacturing and industrial firms are "conspicuous by their absence," finds a good deal to note and commend. He has made such mention as in his judgment the several exhibits deserved. That others probably equally deserving are not mentioned herein is because their exhibits were either absent or overlooked.

Suspension Wire Rope Way.

The first mechanical exhibit observed upon entering the Pavilion, and one that will excite the special interest of mining men, is a model of the Hallidie Wire Rope Way. It is operated by a small motor, and is complete in every detail, showing clearly its practicability and adaptability to all the varying conditions to which it may be subjected. Here also will be seen the street-car cable and grip devices which have so long and successfully been used upon the street-car systems of this and other cities. A full-sized working model of the Wire Rope Way may be seen in another part of the building. The Rope Ways are in use in hundreds of different localities, conveying ore to mills from almost inaccessible points with speed and economy, while the history and success of the cable-car systems are too well known to need mention. These are the inventions of Mr. A. S. Hallidie, who, as the pioneer in this branch of mechanical service, has achieved world-wide fame.

The Washburn & Moen M'f'g Co.

Occupying the same space with the Hallidie exhibit is that of the above named company. This comprises a full line of barbed wire fencing, wire netting, wire cable, copper wire—plain and insulated, for electrical purposes—and a specially prepared "Salamander" wire, absolutely fireproof, and only manufactured by this company, whose San Francisco house is at 8 and 10 Pine street. Mr. Frank Brown is the agent, and since the recent purchase by the company of the California Wire Works, finds a great accession of coast business. The firm is thoroughly equipped and has the deserved reputation of absolute reliability.

Joshua Hendy Machine Works.

This large and comprehensive display of machinery appeals strongly to the mining interests from the fact that it covers nearly every requirement of mining operation. So extensive is it that a description in detail involves some difficulty, but the following items will convey some idea of the broad field that it covers: Engines and boilers, hydraulic elevators, hydraulic giants (nozzles), deflectors, stamp mills, ore crushers, ore feeders, the Hendy-Norhom concentrators, water gates, iron pipe, ore cars, ore buckets, mining pumps, the "Davis" patent safety-brake horse-power hoisting whims, water buckets, etc., in addition to which is a full line of saw-mill and wood-working machinery. The Joshua Hendy Machine Works has been established so many years, and enjoys such high repute for reliability in all its special branches that comment would be superfluous.

The Risdon Iron Works.

Those who are visiting the Mechanics' Fair with a view to posting themselves on late improvements in mining machinery will not fail to carefully examine the Johnston Concentrator and the Improved Bryan Roller Mill. The exhibit is in the northwest corner of Machinery Hall and shows both machines in working trim. They are manufactured by the Risdon Iron Works, one of the oldest and best known manufacturers of ore feeders, rock breakers, mining, milling, pumping and hoisting plants on the coast. The immense works are at the corner of Beale and Howard streets, where is now being made an unusually large steam hoist for the Merced Gold Mining Co.

F. A. Huntington.

Across the aisle from the last mentioned display will be seen the Huntington Centrifugal Roller Quartz Mill. There is scarcely a mining district between Alaska on the north and Chile on the south but what has one or more of these mills in use; they are also at work in China, Japan and New South Wales. Some of the claims made for these mills are: "The cost of same capacity is not more than one-half that of stamps; freight to mine one-fourth that of stamps; cost of erection at mine one-tenth that of stamps; it runs with one-third the power per ton of ore crushed; the wear is less than that of stamps; the wearing parts are easily duplicated; it has a much better discharge and leaves the pulp in better condition for concentrating; it is a better amalgamator, saving fully nine-tenths of gold in the mill (the balance can be saved on plates in the usual manner); its simplicity of construction obviates the need of mechanical skill." In the same space is the Huntington Improved Rock Breaker and the Huntington Patent Ore Feeder. The last named is specially designed to feed the Huntington roller mill. It is simply constructed and can be adjusted to feed fast or slow while in motion, has but few wearing parts and is positive in action. Practical men who are not already familiar with these machines will regard this exhibit with interest.

The Woodbury Ore Concentrator.

Which occupies the same space as the Huntington machinery, has won a list of merits that attest its value. Though on the market but little more than six years, it has, through the untiring enterprise of its inventor and manufacturer, Mr. Geo. E. Woodbury, become widely known and is in very extensive use. Its claim for close and rapid work has been amply demonstrated. The Woodbury concentrator took a first prize at the San Francisco Mechanics' Fair of 1890-91-92, and the same at the California State Fair of 1892; also at World's Columbian Exposition, 1893, as well as at the San Francisco Midwinter Fair of 1894.

The Krogh Manufacturing Co.

This company has a fine display, consisting of centrifugal pumps, combined horse-power and triple-acting suction and force pumps, head-gates, flange, screw and hub end-gate valves, mining horse-power hoist, etc. The exhibit shows a No. 15 centrifugal pump in action, throwing a solid stream of water fifteen inches in diameter with great force. The firm has recently purchased the plant of the San Francisco Tool Co. at 9 and 11 Stevenson street, which, added to its extensive works at No. 51 Beale street, gives it unequal capacity for turning out work in its line. This firm also manufactures steam pumps, mining pumps, deep-well pumps, windmills, tanks, link-belt elevators and conveyors, wine presses, grape crushers, etc.

The McGlew Ore Concentrator.

This is another successful candidate for favor in the concentrating field. It has been at work about three years and has achieved marked success in various localities. Its claims for superiority are its low cost, simplicity of construction and operation, durability, close saving of mineral on difficult ores, great capacity and the very small power required to run it. It is adapted for either rubber or canvas belts, the speed and incline of which can be changed with the utmost ease while in motion. The machine is shown in operation and makes a most attractive exhibit.

C. H. Evans & Co.,

One of the old time machinery builders of the city, makes a good show of power pumps—a class of work for which this firm has for many years enjoyed a high reputation. Special attention will perhaps center in their New Twin Cylinder Pump, which consists of two cylinders placed alongside of each other in a horizontal position (thus avoiding all possibility of becoming air-bound), with a curved passage from one cylinder to the other at one end and at the opposite ends the inlet passage to one cylinder and the outlet from the other. Each cylinder is single-acting, and both pistons are worked from one cross-head by one connecting rod and crank, in the same direction at the same time, but the valves act in opposite directions, so that the water enters at the end of one cylinder, is passed from it to the second cylinder, and then forced on up the discharge pipe, thus keeping the water continuously moving in one direction only, through easy curves, making a very efficient and nice working pump, and one that is very simple, not liable to derangement and easy to get at all the working parts, there being only two valves in the pump, both of which can be got at by removing the one head. The crank shaft is of forged wrought iron. All bearing surfaces are extra large to avoid wear. The belt wheel is made large and with a heavy rim to act also as a fly-wheel to ensure a smooth and steady motion, thus enabling the pump to be run direct without gear wheels, doing away with their friction, noise and wear, and getting better results from the same power. The frame is strong and substantial with the metal disposed in the direct line of strain, where it will do the most good.

They also manufacture pumps for special work to order, also double-acting power pumps either geared or direct belted as required, and with single cylinders or duplex. The manufactory is at 110 and 112 Beale St.

The Rae Perfection Amalgamator.

To the left of the north entrance to the machinery hall is a novelty in the way of amalgamators that is attracting much attention from practical mining men. The proposition to rent the machine to operators of quartz mills at low rates, incurring no risk on their part, is an innovation, and one that will be likely to give the amalgamator rapid introduction. It is very simple and portable, and may well be called a poor man's friend. Full particulars may be had by writing to B. I. Turman, Mechanics' Fair, San Francisco.

Mery's Gas Engine.

Among the great army of gas engines that have been invented on the Pacific coast this one is claimed to be the nearest approach to the steam engine in action. It is a single-cylinder double-acting gas engine, using gas, gasoline, coal oil or crude petroleum with equal success. The cylinder has a sparking chamber and exhaust at each end, thereby permitting the explosive impulse to act both ways on the piston with more regularity and frequency than in other types of gas engines. A water jacket surrounds the cylinder and sparking boxes, and the piston rod runs through water when in motion, keeping it cool. It is fitted with a pendulum governor, and ignition of the gas is produced in the ordinary way by means of a battery or small dynamo.

All of these engines are tested before leaving the works. M. L. Mery & Son, the proprietors of the Chico Iron Works, are the builders, from whom all information can be obtained by correspondence.

The Gold King Amalgamator.

Among gold-saving appliances being exhibited at the Mechanics' Fair, it is safe to say that none have attracted more attention from men actually engaged in the mining industry than has this machine. A simple looking iron cylinder, hung at a slight incline from the horizontal and revolving slowly in its bearings, is the center of an almost constant group of visitors, discussing its merits from the practical standpoint of long years' experience with all sorts of devices for the same purpose. The pulp or sand carrying gold is passed through this cylinder, whereby every particle is brought repeatedly into contact with the interior amalgamating surface, which is so constructed that scouring is entirely avoided, and the claim of its manufacturers that no guilty gold escapes has been pretty well substantiated. The machine has been subjected to a great many tests during the past year with all sorts of ore and beach sand from all sorts of places, and in all instances it has come through triumphant, saving a high percentage on the assay values. The exhibit is presided over by the genial inventor, A. C. Rumble, who is also general manager of the Midas Gold Saving Machinery Co. at 114 First street, San Francisco, where the Gold King amalgamator is manufactured.

Combination Drier and Gold Separator.

This exhibit was without an attendant when visited by our representative, but the circular makes strong claims for it as being a machine that will separate gold from wet or dry earth, sand, or gravel, without the use of water or quicksilver. Its builders, Messrs. Salshury & Mooro, offer to furnish abundant evidence in proof of their claim, having had one of their machines working successfully for the past three months on a mine in El Dorado county, in this State. The firm's office is at No. 21 New Montgomery street, San Francisco.

Steiger & Kerr.

The enterprising proprietors of the Occidental Foundry have entered an almost almost untrodden field of industry on this coast, as their display of stoves and ranges near the main entrance to the Pavilion fully discloses. The display would do credit to any of the old Eastern manufacturers of these goods. Their works are at the corner of Main and Harrison streets.

The Pacific Manufacturing Co.,

In the annex to the Pavilion, make a prominent display of pump and well machinery of all kinds, the leading feature of which is its new windmill, the "Monarch," showing the parted boxes, which is considered one of the best devices that has been placed on any geared steel windmill in recent years. The old style of pipe boxes are so inaccessible that even when bahhitted at the factories where they are made the process of bahhitting is very difficult, and when the mill is set up on the farm and becomes worn, to bahhitt it with the appliances at hand is an impossibility, and the casting must be taken down with blocks and tackle, and requires the work of two or three men; then it must be carried to some foundry or machine shop for expert men to do the work. With parted boxes, as used only on the Monarch steel mill, any farmer or employe about the farm can quickly renew the babbitt; there is no necessity for taking down any part of the mill, no need for ropes and tackle or extra help; only remove the top caps and run the metal, one man or boy can do it. The Pacific M'f'g Co. is one of California's old and well-established concerns. Its place of business is at No. 575 Mission St., this city.

Baker & Hamilton.

Occupying the largest space in the Mechanics' Fair pavilion this year is the exhibit of the Benicia Agricultural Works. It is filled with such a great variety of modern farming and dairy implements that it is only possible to mention here a few of its leading features. The display of plows includes "Eureka" gang and sulky, "Eureka" improved tule sulky, "Eureka" road-grading gang, "Eureka Montezuma" side-hill, "Eureka Jr." gang and the Benicia clipper. In addition there are Benicia-built wagons, buggies, seeders, potato diggers, harley crushers, wine presses, and in creamery goods there are vats, churns, butter workers, cheese presses, etc., besides two standard Eastern makes of cream separators, and in fact every requirement of a modern creamery. Most of these goods are manufactured at Baker & Hamilton's Benicia Agricultural Works, furnishing employment, directly and indirectly, to several hundred men the year round. This firm has, in addition to its immense establishment at the corner of Pine and Davis streets, this city, branch houses at Sacramento, Los Angeles and New York. Its business has for many years extended over the western half of North America and the Latin-American countries to the south.

The Multi-Motor

Is a new departure in windmills, being practically two wheels in one. The two wheels are constructed on the bicycle principle, the weight being thrown largely to the outer rim or hands, thereby giving great leverage and increased momentum. They are so arranged with relation to each other that when the force of the wind is expanded on the blades of one wheel it strikes the blades of the next wheel at right angles and thus in a manner gets a double effect from the same wind pressure. It might appropriately be called a compound wheel. The bearings and gear are simple and accessible. The mill is intended for heavy work, and it is claimed that it will give two and a half times more power for the same weight of machinery than any other mill. Mr. C. A. Norcross is the manufacturer, at 509 and 513 Mission St.

Paraffine Paint Co.

This is an exhibit that will repay careful attention from the miner, the electrician, the fruit grower and the builder. It consists of insulating tape, armature varnish, electrical compound, acid and alkali proof paint for chlorination works, preserving wood and iron from acid, alkali, rust, decay and the ever-busy teredo, fruit-drying paper for raisins and prunes and the celebrated P. & B. building paper. For the latter the manufacturers have the following to say: "It is the only building paper manufactured on the Pacific coast. It is made of rope manilla stock, and, being thoroughly saturated and coated with P. & B. Compound, is absolutely water, acid, alkali, gas and vermin proof. Unlike tar and oil papers, it is odorless and will not dry out or rot. It is the only building paper that improves with age. A house sheathed with P. & B. Building Paper will be warm in winter, cool in summer and healthy all the year round. Used between floors or in walls, it excludes earth and sewer gases, dampness and vermin. When placed under metal roofs, it prevents the corrosion and sweating of the metal by gases generated in the building, and also serves to deaden sound caused by the lifting of the metal. It is unequalled for lining cold-storage warehouses, refrigerator cars, ice-houses and all buildings requiring a normal temperature."

The Paraffine Paint Co. can be addressed at its headquarters, 116 Battery St., S. F., or its branch house, 221 South Broadway, Los Angeles.

Pacific Coast Borax Co.

The exhibit which may be said to lead all others in uniqueness and beauty of design is made by the above-named enterprising company. Conceive of a large canopied pavilion supported by several stanch symmetrical columns surrounded on three sides by counters and backed on the south by a large oil painting representing the immense twenty-mule freight outfit toiling laboriously over Sierra Nevada mountain trails, and with every visible part, except the painting, completely enshrouded in clear borax crystals, and one gets some faint idea of the striking effect of this display. The industrial importance of this product is assuming immense proportions, largely through the efforts of this company, whose resources for mining and preparing it for market are almost unlimited. Its introduction for hundreds of domestic purposes is also being rapidly and successfully pushed all over the United States.

The Winans Automatic Damper Regulator.

At the power room operating the moving machinery of the Fair can be seen the above-named invention, which will doubtless be of interest to those having to do with boiler pressure. This device has no levers, no complications; only one valve and one connection, and that to any point on boiler where water pressure can be had. A plate between the flanges is acted upon by a spring on the lower side and by water pressure from the boiler above the plate. The pressure of the spring can be adjusted by moving the hand-wheel to balance the boiler pressure acting on the plate. A slight increase of boiler pressure forces the plate downward, opens the valve and admits water under the plunger, causing it to rise. The plunger rod is attached to the damper by rod or chain, and by the motion of the plunger varies the position of the damper, thus altering the draft at the proper instant. As the pressure decreases the spring closes the valve, thereby shutting off the supply of water, and the plunger, with the counterweight, lowers in position. The counterweight is arranged for alteration to balance any damper, the rods and chain to which are adjusted to suit each case. The instrument is nickel-plated and mounted on a substantial hard-wood backing finished in oil and ready for attachment to any convenient support in the engine or boiler room. It was invented and patented by J. C. Winans, who deals in anti-incrustation powder and other engineers' specialties at 220 Front street.

The International Correspondence Schools.

TO THE EDITOR:—On the 58th page of your valuable paper, issue of July 27th, is an interesting article on the "Value of a Technical Education," in which the following paragraph occurs:

"In our factories and mills and workshops, today, are young men with ambition, with skill and with a desire to advance. They read, perhaps, poorly, spell even more poorly, but in questions of shop practice they're entirely "at home." Talk with them; they have ideas; they cannot put them on paper, at least so as to make them understood, but they'll explain that if this and that could be done, in this or that way, such or such a result would follow. Ordinary early advantages have been, perhaps, perforce, denied them. Ordinary advantages will not now avail them. How can they now, at a minimum of cost, and without loss of wage-earning time, make up, in special branches, the loss or lack of early education?"

Our Schools are meeting the wants of over 800 just such young men, located in all parts of the world, and they are designed exclusively to meet the wants of those who cannot afford to leave home or lose time from work to get an education.

Our courses, which are 27 in number, include instruction in Mechanics, Mechanical Drawing, Steam Engineering (Stationary, Locomotive and Marine), Electricity, Architecture, Architectural Drawing, Civil Engineering (Hydraulic, Railroad, Bridge and Municipal), Sanitary Plumbing and Gas Fitting, Heating and Ventilation, Coal and Metal Mining, Mine Mechanics, Prospecting, etc. All of these courses commence with Arithmetic, so that to enroll it is only necessary to know how to read and write. Students are furnished with Instruction Papers, which are all the books they need, and with Question Papers, to bring out what they have learned. The answers are sent us for examination and correction. When they need aid students write to us, on blanks which we furnish. Such requests are answered promptly and fully. The Instruction Papers are written by our own Instructors, who know from experience just what workingmen need to learn in order to qualify for advancement, and are freely illustrated.

THE INTERNATIONAL CORRESPONDENCE SCHOOLS,
Scranton, Pa., Aug. 29, '95.

Scientific Progress.

The Production of Cyanides.

By H. N. Warren.

Since the establishmeut of the cyanide process for the separation of gold from its ores, the race for production of the compound, in quantity and at cheap rates, has been almost as keen as were the previous attempts to reduce the alluvial deposits, and thus place upon the market the aluminum of to-day. Potassium nitrate, KNO^3, has long hecn experimented with in the hopes of replacing the oxygen equivalent hy carhon, and hy so doing produce KCN; but the large percentage of oxygen which is in every case set free at once determines the destruction of any cyanides thus formed, although traces of cyanides are always observed to he present after the partial reduction of commercial nitrates by means of carbon, owing to the secondary action of the ammonia thus formed, due to the moisture present.

Rochelle salt, mixed with a quarter of its weight of potassium nitrite, KNO^2, and ignited, has given five per cent as the highest yield of cyanide obtainable, while most hydrated carbonaceous subhstances yield a still lower per cent. Anhydrous sodium acetate, in admixture with a uitrate, has yielded as much as thirty per cent of alkaline cyanide, while in a more recent experiment a mixture of four parts of wheaten flour to one part of nitrate, and the whole thoroughly mixed with three of magnesia and compressed into blocks, yielded, after iguition, from a varying percentage up to fifteen per cent of cyanide. The production of sulphocyanides, and the reduction of the same by means of lime and carhon, have on several occasious given valuable results in accordauce with the following equation:

$$KCNS+CaO+C=KCN+CaS+CO;$$

hut at other times, in consequence probably of the difficulty in regulating the temperature, has resulted in the formation of worthless substitutes.

On returuing to the old method for the production of cyanides, hy the incineration of nitrogen compounds, a valuable additiou will be found in the use of lime or harium oxide. Probably both the barium and calcium cyanides are more readily formed than alkaline cyanides; and in lixiviation, in contact with the alkaline carhonates preseut, they at once form alkaline cyanides and earthy carbonates or ferrocyanides, as arranged for.

Again, potassium and sodium cyanide together are much easier to produce than either separate, fusing at a much lower temperature, and containing more cyanogen, in consequence of the differeuce in the equivalent of sodium when compared with potassium. A mixture of equal weights of the two alkalies reacts well in every respect and yields good results.

Copper as a Conductor.

At ordinary temperatures copper is six times better a conductor of electricity than iron, hut the conductivity of each is increased by cold. Copper is ten times better as a conductor of electricity at 100 degrees than it is at the freezing point of water, and the conductivity of iron increases at a still greater rate until iron hecomes as good as copper. It has been proposed to enclose electric conductors in pipes to be kept very cold by some of the well-known processes for extracting heat, such as are in common use for ice production, as the amouut of copper needed would be less as the temperature was less. It may be some time before this plan is carried out, but that it is possible to thus reduce the cost of electrical couductivity hy ruuning an engine to produce cold is certain, and it will be done when the cost of copper hecomes commercially comparable with the cost of running an engine for such a purpose. Experiment seems to indicate that all the metals are thus affected by cold, and that at absolute zero their electrical conductivity hecomes infinite, or, as it is more generally stated, the electrical resistance of metals becomes zero. The other properties of subhstances are also profoundly changed so as to he radically different from what they are under ordinary conditions. Cohesion, tensile strength, malleahility, etc., become less and less, so it seems altogether prohable that the qualities and states of matter so familiar to us as solids, liquids and gases depend absolutely upon temperature, and that at ahsolute zero there would he neither solid nor liquid nor gas, and that electrical and magnetic qualities would he at a maximum. This opens up a great field for speculation as to the nature of matter itself, when most of what we call its properties may he emptied out of it by simply reducing its vibratory motion.

A refracting telescope is to be huilt for the end-of-the-century World's Fair in Paris, having an aperture of forty-eight inches. The Yerkes telescope, soon to be set up at Lake Geneva, Wis., for the University of Chicago, will have an aperture of forty inches, and that of the Lick telescope at Mt. Hamilton, this State (the largest refractor now in service in the world) is thirty-six. But it is proposed to have the tube of the French glass immovahle iu a horizontal position, and to throw into it images of the heavenly bodies by means of a siderostat or heliostat, a huge mirror, outside of the observatory and adjustahle, so as to take a ray of light from a moving body and continually reflect it in precisely the same direction. The maiu story of this great project has been confirmed by Ambrose Swazey, of the firm of Warner & Swazey, who make telescope mountings, but there are reasons for douhting whether the undertaking will yield any hetter results than our California telescope, if as good.

Those who have investigated the subject with scientific exactness state that only ahout six or eight per cent of the total heat value of coal is utilized in au engine by heating transformed into power. Iu tracing up this loss it is stated that there are required some 1202 degrees of heat or heat units—not degrees of temperature—to change one pound of water into steam, while during the absorption of this amount of heat the temperature of the water remains at 212 degrees. This immense amount of steam is rendered latent and does not sensibly affect the thermometer. Scientific authorities explain the cause of this loss in the steam engine as due to the fact that the 990 degrees absorbed by water in being trausferred into steam—212 degrees are apparent upon a thermometer, and which, added to 990, make up the 1202 degrees above mentioned—go into the engine unindicated by the thermometer, leave in the same manner and go to waste.

Distinct tides iu the atmosphere, corresponding to those of the sea, and produced twice daily hy inner attraction, have heeu traced hy M. Bouquet de la Grye in the barometric records of stations removed from powerful local disturhances. The recorded observations of Brest, St. Helena, Cape Horn, Batavia and Singapore, give positive evidence of a regular ebh and flow according to the moon's position. The effect is slight hut measurahle, the greatest atmospheric tide at Brest being shown hy movement of a quarter of an inch in a water harometer, which is equivalent to about one-fiftieth of an inch in the mercury harometer. The tide seems to bear about the same ratio to the weight of the atmosphere that the sea tide bears to the depth of the ocean.

A French geographical society proposes to divide the face of the clock into 10 hours of 10 minutes and 100 seconds each. This is to make time uuiform with the decimal system or count by tens. The count by twelves which uow shows on the face of the clock survives from the earliest time—probably from long before the invention of letters.

Mechanical Progress.

The Heilman Locomotive.

A rival of the Baltimore and Ohio electric locomotive is the Heilman locomotive, in use on the Northwest railroad, a trunk line leading out of Paris, France. It is said to be a success, and its admirers predict that it will supplant all competitors. While the Baltimore and Ohio locomotive is supplied with electricity from an overhead wire, the Heilman locomotive carries a triple-expansion steam engine, which generates the electricity required. Steam power produced in the ordinary way drives a dynamo borne on the tender. The motors are placed on the trucks. This arrangement is said to give a saving of 20 per cent in fuel over the simple steam locomotive. At first sight such a result seems incredible. It might be conceded that a locomotive geuerating its own electricity by the use of steam would be more economical than the Baltimore and Ohio electric locomotive, since it dispenses with costly overhead copper couductors, and is exempt from the waste of current incident to the use of long wires, but to suggest that it is more economical in fuel than the ordinary steam locomotive sounds like a joke. The explanation is that Heilman gets more power out of a given weight of coal hy using a triple-expansion engine. Ordinary locomotives are extremely wasteful of steam. By using the same steam thrice instead of once enough power is saved, it is said, to make up for what is lost in couverting ordinary power into electricity. If this be practicable, the Heilman locomotive has for most purposes decided advantages over other electric locomotives, since it can he used on ordinary tracks without special preparation. Trolley wires and poles are dispensed with—a great saving. It is suggested, however, hy the Heilman invention that, if it he a practical thing, a further development of the steam locomotive is possible, which would give it a new lease of life. For use in the long tunnels the Baltimore and Ohio locomotive remains the hest, since it produces no smoke, as the Heilmau does.

Trouble from Oil in Boilers.

The fact that the use of oil as an anti-incrustator in steam boilers should be occasionally attended by bagged furnace crowns, if nothing worse, continues to he a source of wonderment to a good many people who ought to know something of the possibilities of the oil treatment. It has heen pretty well demonstrated that a very small globule of oil, ou becoming attached to the inner side of a boiler sheet, will sometimes collect a mass of dirt particles contained in the water, the whole mixture ultimately haking on and forming an excellent non-conductor. This heing the case, the overheating and hulging of the sheet at that particular place are quite in the regular order of things. The only specially noteworthy thing about the matter is that a very thin film of oil and a very small admixture of dirt are sufficient to do a great deal of harm, and that the scale formed by them may he so inconspicuous as to readily escape detection; hence the seeming mystery which sometimes is supposed to attend the coming down of a crown sheet.—Cassier's Magazine for Septemher.

One Hundred Miles an Hour.

There is now being built at the Baldwin Locomotive Works in Philadelphia an ordinary locomotive with driving wheels of five feet diameter, which the inventor says will, as soon as completed, draw a train of cars from Philadelphia to New York in one hour. The Baldwins have nothing to say. They are simply building it for W. T. Holman of Miuneapolis, an inventor, who has desigued the machine. The locomotive is not to he set on the rails as engines ordinarily are. It is to be placed on what are known as the Holman friction-geared trucks, which will raise it thirty inches. The inventor says:

"It will be just like any engine, except that each of its driving wheels will rest on aud betweeu two smaller wheels, which in turn will rest on and between three other wheels that finally rest on the raiis. The instant the drivers of the locomotive begin to turn they necessarily through friction give an opposite rotary motion to the small wheels ou which they rest. The natural and inevitable result is that one revolution of the locomotive's driving wheels hy this multiplicity of wheels in pyramid form carries the engine just twice as far forward in a single revolution of the wheels as if they were on the track themselves."

Caisson Foundations.

A system of caisson-sinking for foundations of bridges, buildings, etc., invented hy Engineer W. d'H. Washington, of Charleston, W. Va., and receutly tested in New York, is highly spokeu of. Where the site of a proposed foundatiou is of sand or loose earth it presents great difficulties to huilders. Below the water line the earth at the sides caves iu wheu an excavation is made. The ordinary device is to sink a caissou, or its equivalent, as the excavation proceeds, to hold back the sand. Sometimes the sand at the sides, with the water it contains, is frozen in places, and rigidity is thus sccured. But there is difficulty iu sinkiug the caisson with sufficient speed, and the freezing process is not always practicable. Mr. Washington's invention consists iu the utilization of the water jet on a large scale to open the way for the descending edge of a steel caisson of the size of the foundatiou to hc constructed. The use of a siugle water jet to open the way in sand is well known. Mr. Washington places a multidude of jets about the bottom of his caisson, and the water emerging under great pressure opens a way, while weights piled on top of the caisson force it downward. In the test of July 18 one caisson was sunk to bedrock, a depth of 38 feet, in three hours. An evident advantage lies in the circumstance that by this method adjacent buildings are not endangered. The earth remains in place until the caisson is sunk. When the earth or sand in the caisson is removed there is no displacement of that outside.

A British firm of iron producers reports to the London *Times* the result of a five years' experiment with the eight-hour system. At first the cost of each ton of output was increased, hut uow it has fallen as low as it was in 1889. In other words, the men get as much work done in eight hours as they used to get done in twelve. That this is not merely the result of a coincidental improvement in machiuery or the methods of manufacture is vouched for hy the managers of the works, who have considered the point. It is reported by the Boston *Transcript* that a similar test is being made hy a New England manufacturer, who employs 700 operatives. He has not yet made a wholesale change, hut his idea is to ascertain what constitutes a fair day's product, and then to help his employers to fewer hours of labor by requiring from them only that product turned out as it may be in fewer hours than at present. If nine hours of fresher and more buoyant labor will turu out the same product as ten hours of more jaded labor, he can afford to pay, and is disposed to pay, the same wages for the former as for the latter.

By suspending from au egg-shaped balloon a hicycle gearing, with pedals to revolve a screw propeller, and adding wings at each side to steer with, an inventor has devised a flying apparatus which is reported used in daily flights to and fro over New York City. the halloon gives buoyancy merely, the screw gives motiou and the wings guide the flyer to the right or left, up or down. If all that is asserted about the contrivance is true, the problem of flight in still air or mild winds is nearly solved.

Electrical Progress.

A New Thermo-Electric Apparatus.

The thermo-electric apparatus of H. B. Cox of Hartford consists essentially of a series of metallic rings, each formed by joining a number of wedge-shaped pieces of two different alloys. The advantage of this appliance is said to be the merging of the component parts of the electrical element into each other in such a way as to have practically no junction point to oxidize. The pile of rings, separated by sheets of asbestos, forms a hollow cylinder, which is lined with cement and cemented into a metallic casing. Provision is made for the circulation of a cooling current of water between this casing and the outer shell of the generator, which, in one form, resembles an ordinary coal-burning heater. A coal fire or gas flame is placed in the interior of the cylinder, and by this simple means of transforming the heat into electricity, the inventor claims to get five times the energy from coal that can be realized by steam, and with this remarkable result—so long sought in vain by Edison, Tesla and others—to be able to produce five ordinary incandescent lights from a coal consumption costing a cent an hour.

Regarding the use of electricity in connection with the Bessemer process, it is shown that the necessary degree of heat has to be maintained for a considerable time, for if the metal begins to chill, the success of the whole operation is impaired. The prevention of the chilling has always been a problem with steel men. Recent developments in the power of the electrical furnace have also shown that it is possible to obtain enormously high temperature by the use of heavy currents, and this discovery has been utilized at Homestead. A heat was allowed to become somewhat "cold," and the current was turned on. About twenty tons of molten steel that was lying dead in the ladle immediately began to boil, and in a few moments reached a white heat. The blaze ascended several feet above the ladle and was of blinding intensity. The unaccustomed degree of heat and the dazzling glare made the operation of pouring the steel most trying, and many of the workmen had their eyes burned badly. The test was almost too much of a success. In reality, it was a terrible demonstration of the frightful temperature which it is now possible to obtain by human agency. Probably not more than a temporary injury was sustained by the workmen, but in future they will be provided with blue glasses, so as to withstand the intense light; and in future, provision will be made to have the charge of current, which at the test was excessive, under perfect control.

A company in Camden, N. J., has a force of men engaged in building an electrical carriage—a carriage to be built just as carriages now are, but to be operated by a storage battery, hidden in the bottom of the vehicle, instead of by horses. Not only do those building this carriage expect it to supersede the carriages now in use, but they declare that it will in time take the place of bicycles; and, in their enthusiasm, they add that they would by no means be surprised if the trolley cars should feel the effect of the new invention once it gets on the market and people are able to reach its price. Two of the carriages are now being built at the works of two different sorts, as far as the mechanical construction goes, but both are on the same principle. The difference is the method of operation, and these differences represent the views of an electrician in one case and of a machinist in the other. They are to be completed by the 1st of November, and will at once enter upon a race near Chicago to test the speed. They are being built of the best material, and will be in every sense first-class carriages of "trap" pattern, and are expected to cost about $1500 complete for the two. This cost, however, can be regulated if the carriages do all that is promised for them, and they can be made in the future at almost any price. In any event, the first cost will be the only real one, because they are to be equipped with a storage battery which will run the vehicle 500 miles before requiring to be recharged, and this at a cost of but 13 cents for each 50 miles. A speed of 17 miles an hour is promised for the new invention.

A location for the test of electricity as a motive power on the canals of New York State, which will be made on the 25th inst., has been fixed within the limits of Tonawauda, N. Y. The cable or traction system will be used, and both preliminary and official tests will be made. The experiments will be with eight or ten canal boats lashed together, which it is expected to move at a rate of about six miles an hour. F. W. Hawley, vice-president of the Cataract General Electric Company, says: "The result of the coming test will largely influence the electors of New York next fall when they come to vote on the question of appropriating $9,000,000 for the enlargement of the canals. Mule power cannot compete with the steam engine. On the success of the cableway or some similar device hangs the future of the world's greatest waterway."

Electricity is rapidly annihilating time and distance. A Philadelphia concern has recently received a contract for the construction of an electric railroad in Cape Town, South Africa. Already continuous lines of electric roads connect the towns and cities in this country and are being extended in all directions, and the time may come when one can take an electric car at Cape Horn and ride to the North Pole, such is the progress that is now being made in the science and art of the electrical transmission. This, too, without discomfort from heat or cold while passing through the several climates en route, for the electric current could be utilized to produce warmth in the frigid zone or furnish a cooling and refreshing breeze while racing against time beneath the scorching heat of the torrid zone.

There seems no present likelihood of any cessation of litigation between the General Electric and Westinghouse Companies. The Boston *News Bureau*, of August 14th, quotes authority "prominently identified with General Electric Company" as intimating that the position of the Westinghouse Company will have to be materially altered before there can be any hope of an alliance of interests. The same authority is quoted as stating that he "had been given assurance that the General Electric Company could, if it so desired, make almost the same arrangement with the Baldwin Locomotive Works as Mr. Westingbouse has made, in all essential features."

The following method of steeling copper plates is from *L'Electricien:* Dissolve in 500 parts of water 50 parts of sal ammoniac and 100 parts of ammoniacal sulphate of iron. Add a few drops of sulphuric acid to acidify the solution. Connect the copper object to the negative pole of a battery, and place at the positive pole a plate of iron of about the same dimensions. The solution must be maintained at a temperature of 60° to 80° C. The deposit of iron is exceedingly hard, and is formed very rapidly. Two Bunsen or bichromate cells are usually sufficient.

The first application of the three-phase long distance for electric railway work will be made by the General Electric Company, Lowell, Mass.; the low-voltage alternating current will be raised to 5000 volts, and be carried to two sub-stations, nine and fourteen miles distant, where it will be received in transformers and rotary converters and sent to the line at 500 volts.

Practical Information.

Not Luck, But Pluck.

No man ever made progress on the wings of luck. Wings, anyway, are for nightingales and angels. Legs are for men to walk mountain paths and climb to the summit. Place the letter "P" in front of the fool's word "luck." That will change any man's seat from a wilderness stump to a throne. The world never searches for a man; it always knows where to find him. The right man to wield a sceptre is not sowing wild oats out of a lazy hand, or trying to make progress on the back of the wild goose "luck." He has learned the better word and faces the world with genuine pluck. A pound of that material is worth a ton of luck. The man who thinks success is inherited fortune and a lazy life, differs from the animal only in having two legs instead of four.

Hard work is the only genius. Rags and sin are twin sisters, and borne of the old hag, Idleness. Elbow grease is the only substance for the axle of a chariot. Place the bucket of toil under the pipe; luck is a leaking pail. Pluck is the word. The individual who believes in luck makes a farce out of the world and reveals his empty head, in which the moths and mice of superstition and folly play hide-and-go-seek. They saw Edison discovered the phonograph by luck; it was an accident. But there were long years of hardest toil which preceded his hearing that sound, and long months of hardest toil which followed it before it was perfected. That streak of luck, so called, could only run through the life of an Edisou. If David is to be king he must first be the good shepherd lad. If he is to win the victory over the giant he must first know how to handle his sling. Every gun to shoot and hit the mark, must first be loaded and aimed and fired. Ram home the powder and shot, take aim, do it. Without a prepared brain, and a prepared body and a prepared character the man is sure to fail. Life is a battle; it is not parade. It is sailing through the Mediterranean islands and streams not a row on the peaceful lake. It needs everything ready; the compass and the chart, and the pilot and the captain and all ready. The water compartments closed and the ice off the lifeboat ropes.

An unprepared business man is speedily discovered; an unprepared politician is speedily found out and falls out of sight. An unprepared preacher does not hold his place or his audience. When the preparation is made and the arrow is on the bow do not fail to aim it right. There is too much random shooting, and the target never trembles. Aim to fill your place and fill it well, so well that you cannot be spared, and your death makes a void.

A loaded gun, and well aimed but not fired, is another blunder. You must pull the trigger. Dare to do. Ability unexerted is as useless as a bushel of acorns fast withering into nothingness; plant them and you will have the forest. Great things may be in a man's brain and his heart, as oaks are in acorns. Plant them, bring them out. Nobility of character and all real success are made by the doing process. Load, aim, shoot and you will hit something."

The Work of the Mississippi.

The Mississippi has, in the course of ages, transported from the mountains and high land within its drainage area sufficient material to make 400,000 square miles of new land by filling up an estuary which extended from its original outfall to the Gulf of Mexico for a length of 500 miles, and in width from 30 to 40 miles. This river is still pouring solid matter into the Gulf, where it is spread out in a fanlike shape over a coast line of 150 miles, and is filling up at the rate of 362,000,000 tons a year, or six times as much soil as was removed in the construction of the Manchester ship canal, and sufficient to make a square mile of new land, allowing for its having to fill up the Gulf to a depth of eighty yards.

Some idea of the vastness of this operation may be conceived when the fact is considered that some of this soil has to be transported more than 3000 miles, and that if the whole of it had to be carried in boats at the lowest rate at which heavy material is carried on the inland waters of America, or say for one-fifth of a cent per ton per mile over an average of half the total distance, the cost would be no less a sum than $1,190,000,000 a year. Through the vast delta thus formed the river winds its way, twisting and turning by innumerable bends until it exteuds its length to nearly 1200 miles, or more than double the point-to-point length of the delta, continually eroding the banks in one place and building up land in another, occasionally breaking its way across a narrow neck which lies between the two extremities, and filling up the old channel.

The canal system of France caused a disregard of distauce. Amongst the imports at Rouen is a eonsiderable quantity of feldspar from Norway. The chief part of this feldspar goes by lighters into the heart of France, into the department Loiret. There, upon the banks of the canal de Briare, is an immense button manufactory. Over 1500 men are employed in it, and the sewing of the buttons upon the cards on which they are sold all the world over gives occupation to many thousands of women and children in the surrounding country. Crushed up and set with milk, for which purpose more than 100 cows are kept upon the premises, this feldspar from the mountains of Norway serves as the material from which buttons are made.

The entire platinum output of the Ural Basin, a foreign journal announces, has been sold at a very high price for ten years ahead. Some years ago this metal cost 2700 roubles per pood of 36 English pounds. In 1893 an English firm acquired the decadal production of the Tagil mines at the price of 8000 roubles per pood. Now a French electrical company has concluded a contract with the remaining Ural mines for the supply of the ten years' output at the rate of 12,500 roubles.

Following are recipes for preparations to keep tools from rusting: Dissolve one-half ounce of camphor in one pound of melted lard; take off the scum and mix in as much black lead (grapite) as will give it an iron color. Smear the tools with this mixture, and after twenty-four hours rub clean with a soft linen cloth. Another coating is made by mixing slowly six ounces of lard to one ounce of resin, and stirring till cool. When semi-fluid it is ready for use.

A novel test of electric power as against steam was recently made on the Nantasket Beach road. A heavy train, to which was attached a locomotive at one end and a motor at the other, was used for the purpose, and both engine and motor pulled together in opposite directions. The electric motor pulled train and locomotive easily, despite the fact that the latter was under full head of steam and pulling against it.

Prof. Ramsay will soon have fresh facts of interest to announce regarding the new elements argon and helium. He recently tested several chippings from meteorites and found both elements present in all of them.

A French medical authority asserts that death caused by a fall from a great height is absolutely painless. The mind acts very rapidly for a time, then unconsciousness ensues.

The rei of Brazil, like the mill of our own money table, is an imaginary coin, no piece of that denomination being coined. Ten thousand reis equal $5.45.

The Chinese stamp bars or ingots of gold or silver with their weight and fineness, and pass them from hand to hand as coin.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.
Crocker Building, Rooms 201, 202 and 203, San Francisco.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold: vanner concentration and chlorination. Address. Golden King M. Co., Allegheny City, Sierra Co., Cal.

ALMARIN B. PAUL, M. E.,
ROOM 58, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.

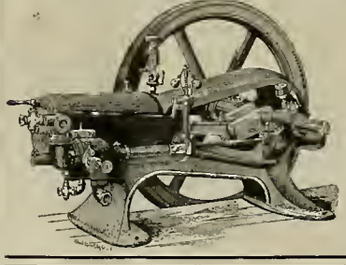
SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE
FOR POWER.
THIS IS WHAT THEY CAN DO:
Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten honrs' run with one of onr five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:



Coal Gas, ten hours' run. 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run. 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run. 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.
It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼o per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.
